A

Aberdeenshire Roads, 277
Aftermath of War, 295
Amenities, Seaside, 83
America's First Waterworks, 422
America, The Local Candidate in, 516
Anchorutes Purpurescens, Some Notes on, 574, 657, 713

Annual Reports:—

Aberdeenshire (Deeside), 277
Bedfordshire, 624
Belfast, 301
Berkshire, 96
Birmingham, 154
Bristol, 345
Cumberland, 601
Holborn, 660
Kent, 315
Middlesex, 322
Newcastle-on-Tyne, 281, 443
Perthshire (Western District), 43
Renfrewshire, 106
Sheffield, 572
Stockport, 677
Worcestershire, 489

Applied Geology in Municipal Engineering, 217, 221, 245
Arterial Roads in Greater London: Report of Sectional Conferences, 638
Artisans' Dwellings, Hot Water Supply to, 84, 131
Ashpit Cleansing at Bradford, 461

Assistants' and Students' Section:—

Applied Mechanics, 169
Bending Moment, 658, 689
Building Construction, 98, 393, 418
Building Materials, 719
Collapsing Strength of Pipes, 55
Concrete Floor, 283
Damp Prevention, 573
Disinfection, 133
Foundations for Chimney Shaft, 205
Geodesy, 472
Iron Curved Roof, 309
Marine Surveying, 206
Materials, 525
Mechanics, 447, 498, 573
Practical Mathematics, 337, 361
Pumping, 20
Rain Gauge, 20
Reactions of Beams, 360
Road Construction, 168
Sewerage, 254
Sewer Construction, 418
Sewer or Drain, 55
Stability of Wall, 628
Statics, A Question in, 547
Strength of Materials, 230, 498, 628
Strength of Shaft, 748
Surveying, 133, 168
Testing Drains, 472
Underpinning, 602
Vectors, 719
Ventilation, 547, 602
Water Supply: Surface Springs and Deep Springs, 525
Association of Managers of Sewage Disposal Works:—
Annual Meeting, 691, 754
Annual Report, 691
Hon. Secretary's Retirement, 691
Norwich Meeting, 79

MR. W. H. MATTHEWS JONES,

City Engineer and Surveyor of Chester.

President of the Institution of Municipal Engineers, 1914-15.

The Surveyor

And Municipal and County Engineer.

Vol. XLVI. JULY 3, 1914. No. 1,172.

Minutes of Proceedings.

The Basis of Exchequer Grants for Road Maintenance.

In a letter to the *Times*, Colonel Ivor Philipps, M.P., expresses his apprehension that, unless some steps are at once taken by local authorities to concentrate public opinion on the subject, it seems probable that the road grants will be made in the form indicated in the Chancellor's Budget speech, "and without any particulars being given as to the mileage of roadway of each class, or the amount of the grant to be allotted to each county or county borough." Mr. Philipps then proceeds to explain his own view as to what is the proper basis for the distribution of the grants, and what is the procedure which should be followed. Taken as a whole, the letter suggests that the commonplaces of road administration have just loomed above the writer's horizon, with all the freshness of matters hitherto unconsidered. The procedure which he recommends is to a considerable extent inevitable and already in course of being put into effect, and the idea that the proportion between the mileage of first-class roads and that of second-class roads should vary according to the circumstances of each county is one which necessarily accompanied the first steps which were taken in the matter. Large areas will lie in gaps in the network of first-class or trunk roads, and other large areas, served by important secondary roads and main roads with much less traffic than those of the chief trunk roads, will necessarily receive the bulk of their grant on the 25 per cent basis. Again, the suggestion that the grants should be made in accordance with the rateable value, the area, or the population of each county is most illogical, since if any of these is of service as a basis for the distribution, it is clearly desirable that all of them should be taken into consideration, with qualifying factors in accordance with the relative importance of each. Mr. Philipps considers, however, that distribution in accordance with rateable value is, on the whole, the fairest system, and the only one which will meet with general approval—a quite untenable proposition, since one of the principal objects of the making of these grants is to provide for the maintenance of important trunk roads which pass through sparsely peopled areas of low rateable value.

As our readers know, our own view is that a large number of factors, including natural conditions, should be taken into account; and we have pointed out that the relations between area, population, rateable value, and road mileage should be considered in drawing up a scheme of factors influencing the allotments. Failing a really logical apportionment, made with the help of experts in local government administration, in highway engineering, and in natural and other local conditions, the best basis for the making of the grants is the exercise of pure judgment. By this means the various factors will, in a rough-and-ready manner, be taken into consideration; and this, it seems, is the best that the Road Board is likely to give us. The Road Board will receive from the local authorities their views as to which roads should be included in each class, and they will then get out their scheme, and prepare maps of the first class and second class roads. There is nothing, we believe, in the provisions that are to be made which will prevent the Board from including among the second class roads any road, however humble its class, with respect to which it may seem desirable to relieve the local ratepayers of a quarter of the cost of maintenance. Local authorities may therefore, if we are right in this, make their recommendations not only on a traffic basis, but also on any other basis which seems equitable, and we see no reason why there should not be specially liberal grants for second class roads in counties where large areas are on soft and silty ground, and where the costs of materials suitable for the making up of thick and well-drained crusts are high. The changes which, as we have just learned, are to be made in the Budget, and the probable necessity for legislation in order to give effect to the provisions relating to grants to local authorities, may result in considerable delay and some uncertainty in the matter. In the meantime the Road Board are collecting the materials for their maps, and may yet, we hope, decide to carry out the work on a logical basis and with the thoroughness which is demanded by the consideration that its effects will be lasting. Unsatisfactory as it is in some aspects, and unimportant as regards its definite, or more or less definite, recommendations, Colonel Ivor Philipps' letter is to be welcomed as tending to

creates the impression that the matter is worth the most careful attention and that the measures to be taken to ensure a just and useful classification cannot be taken with too much care and thoroughness. Road improvement funds can hardly be used to the extent necessary if the work is to be well done, and a liberal sum from the Exchequer for this purpose might be provided with great advantage in the end.

* * *

The Cheltenham Conferences.

Mr H. T. Wakelam, M.Inst.C.E., the county engineer of Middlesex, who presided so ably over the Roads Conference held last week in connection with the annual meeting of the Institution of Municipal and County Engineers at Cheltenham, went to the very centre of the modern road problem in the opening sentence of his inaugural address. If questions relating to ways and means could be excluded, highway engineers would have little difficulty in providing roads which would be void of offence to those who use them; and the possibility of lightening the financial burden attaching to road maintenance was therefore quite properly put in the forefront among the questions for discussion at the conference. Another important topic to which attention was called by Mr. Wakelam was the close connection which exists between town planning and the laying out of arterial roads. There is much to be said for the plan which he advocated that the routes of any proposed arterial roads should be first laid down, thoroughly discussed by sectional or central committees, and finally decided upon before town-planning schemes are sanctioned. By following this procedure the town plan could be designed with a view to the proper utilisation of main traffic routes, and isolation, which is both unnecessary and undesirable, could be avoided. Mr. Wakelam concluded his address with a graceful reference to the work of the Road Board and a tribute to Sir George Gibb, who was expected to take part in the conference. It was a pity that pressure of work prevented the chairman of the Road Board from being present, particularly as it was inevitable that his department should be referred to many times in the course of the proceedings. Altogether the conference afforded fresh evidence of the high position now taken by British road engineers. As Mr. Wakelam pointed out, whereas a few years ago British engineers were advised to go abroad to learn their business, times have so changed that engineers from foreign countries are now constantly visiting England seeking advice on questions relating to the important problem of road construction.

Those who were present at Cheltenham will agree that one of the most striking features of the whole meeting was the excellent collection of plans and models which were exhibited in connection with the Town Planning Conference. Mr. Pickering, in opening the conference, mooted the idea of a permanent collection under the official auspices of the Local Government Board. There can be no doubt that if such a collection were made it would have a double value. In the first place loan exhibitions might be held in various towns—a proceeding which would necessarily have a great educational value. Then again the collection would be of great practical use to those towns about to embark upon schemes of their own. It would be a fitting outcome of the highly successful Cheltenham meetings if a permanent memento could be provided by the establishment of such a collection either by the Local Government Board or by the institution itself. The practical interest of the board in the conference was evidenced by the presence of Mr. Thomas Adams, who delivered a most interesting address, which was much appreciated. Among the subjects to which he referred were the inclusion in schemes of lands already built upon, the desirability of communicating to the Local Government Board as early as possible notice of intention to prepare a scheme, and the great progress which has taken place in regard to town planning since the Act of 1909 was passed. A gratifying feature of the address was the recognition which it accorded to the municipal engineer as being naturally the person to prepare a town-planning scheme. While fully realising the necessity for co-operation between engineer, architect, owner, and any other interested party, this is the position that ourselves have always taken up. Mr. Adams' address made an excellent introduction to a successful conference.

* * *

Sewage Disposal and Water Supply at Chicago.

It must be a source of gratification to engineers in this country to learn that two British engineers have been called upon to assist with their advice in dealing with the sewage of and securing a satisfactory water supply for such an important city as Chicago, and Mr. J. D. Watson, M.Inst.C.E., of Birmingham, and Mr. A. J. Martin, M.Inst.C.E., of Westminster, are to be congratulated on having been chosen to act in conjunction with Dr. G. A. Soper, of New York, as an expert committee to advise the Chicago Real Estate Board in such a difficult matter. Their preliminary report, extracts from which are printed on another page, has recently been issued, and contains several interesting features. It should be observed that the present system of sewage disposal is by dilution with water taken from Lake Michigan, the diluted sewage being discharged by way of a canal into the Desplaines River system, which ultimately empties into the Gulf of Mexico. The volume of diluting water which may be taken from the lake is limited by law, and as the volume of sewage has increased beyond all expectations, the conditions are now very unsatisfactory. The water in the Desplaines River was offensively polluted at a distance of 85 miles from Lake Michigan when inspected by the committee. Elsewhere odours were noticeable, grease lay upon the surface of the river, dead fish were numerous, and large quantities of sewage fungus were observable in the water. No wonder these conditions produced "a strong impression" on the board of experts, who recommend that the sewage must be treated in varying degrees according to the local conditions and requirements of different sections of the city, and that the water supply will need to be filtered.

To those who are not particularly concerned in the specific local problem those sections of the report which deal with the question of nuisances arising from sewage and trade wastes will be the most interesting. It is pointed out that the word "nuisance" does not admit of precise definition, and that what is a nuisance to some, or in some places, is not necessarily a nuisance to others in the same place or to anyone in some places. Further observations deal with cases where odours of a peculiarly offensive and pervading character from certain industrial establishments exist in close proximity to points of excessive sewage pollution. The opinion is expressed that the existence of one nuisance cannot condone another, nor is it reasonable, where many persons are affected, to aggravate an offensive condition of the atmosphere by the addition of another. Indeed, the whole question of what is a nuisance is dealt with in a very thorough and able manner, and these sections of the report are worthy of careful study by all who have to deal with sewage disposal works.

Private Street Works: The Charge on Premises.

An important and novel point of private street works law was decided in the recent case of *Croydon Rural District Council* v. *Betts* (noted at page 958, *ante*). It will be remembered that sec. 257 of the Public Health Act, 1875, contains provisions for enabling a local authority who have incurred expenses for works for which the owners of premises are liable to recover those expenses. Perhaps the most important of these provisions is that until their recovery, the expenses (with interest) are to be a charge upon "the premises in respect of which they were incurred." Now where each house or plot of land in a street belongs to a separate owner, of course, there can be no difficulty in applying this provision. But where a single individual is the owner of several houses or plots the section leaves it doubtful whether the expenses apportionable to the several premises can be lumped and charged generally on the whole, or whether the several premises are liable only each for its apportioned part. A moment's consideration will show that the question is not merely academic, but is of considerable practical importance from whatever point of view it is regarded. From the local authority's standpoint, where there are properties of unequal value (*e.g.*, houses and uncovered plots) it would obviously be more advantageous for the charge to be general. From the owner's point of view, and from that of his mortgagees, on the other hand, the general charge might operate unfairly. Mr. Justice Warrington decided that the charge is not a general one, but a separate one on the several and respective premises. He pointed out that the section does not give a charge on the interest of the owner, but on the property itself. Hence he thought it was only rational to hold that the Legislature intended that there should be a separate charge in respect of each separate plot, otherwise the charge could not be worked. It would be extremely unfair to the mortgagee of a small piece of land to have his security charged with a large sum in respect of other property of the mortgagor. The provisions for apportioning the expenses, in the learned judge's opinion, confirm this view, and show that the Legislature regarded the premises in respect of which the expenses are incurred as separate premises. However convenient it might sometimes be to a local authority to have a general charge, this decision appears to us to be consonant both with a reasonable interpretation of the section and with the equity of the case.

Superannuation.

A most important deputation from the National Association of Local Government Officers waited upon the President of the Local Government Board last week and placed before him the views of the association in regard to superannuation. Sir Homewood Crawford, the solicitor to the City Corporation, who holds the office of president of the association, acted as spokesman, and in a very able speech urged the several points in favour of the establishment of a national scheme which are so familiar to the great majority of municipal officers. He pointed out that, whereas municipal officers are called upon to discharge duties similar in character to, and certainly as important in their nature as, those duties which are discharged by civil servants, Poor-law officers, police, medical attendants of asylums, they have no right whatever to pension, although the officers he mentioned could claim one as a right when they unfortunately had to quit the service, either through the effluxion of time or through a breakdown in health. The confusion which exists owing to the fact that several local authorities have obtained schemes by means of private Acts of Parliament was emphasised, together with the consequent difficulty in which an officer is not infrequently placed if he desires to be transferred from one authority to another. The most satisfactory sentence in Mr. Herbert Samuel's reply was undoubtedly that in which he said "Therefore you have, in my view, a strong case—a very strong case—in support of your claim." He pointed out, however, that the question was surrounded with difficulties, and further that the Civil Service, as regards the higher branches of it, have a very severe competitive examination. The lower branches have a competitive examination which is not so severe, but a very high standard is required among the number competing to obtain the limited number of places. The question thus arises as to whether the grant of superannuation should not be accompanied by the establishment of a national standard for the officers of local authorities. In the result, the President promised to prepare a statement of the present position in regard to superannuation for local government officers, and to submit it to the representative association of local authorities, asking if they are prepared to approve of an inquiry being held into the whole question.

The Training of the Highway Engineer.

The first paper which came before the Roads Conference at Cheltenham last week was by Mr. H. Percy Boulnois, M.INST.C.E., who took for his subject "The Training of the Highway Engineer of the Future." The paper, which will be found in another column, dealt with a matter upon which Mr. Boulnois has already written in our columns. Briefly, his argument is that a new profession—namely, that of highway engineering—is coming into being; that those who intend to follow this new profession must receive a special training for their work; and that, having received such a training, they should be adequately remunerated for their services. The training advocated by Mr. Boulnois consists of a judicious mingling of theoretical work at a college or university with a sound practical course of pupilage to a practising engineer. The difficulty in such cases always is as to the proportions of the two ingredients of theory and practice, and as to which should precede the other. So far as the necessity for increased theoretical training is concerned, Mr. Boulnois' argument is amply justified by the increasing prominence which is being given to the technical and scientific aspects of road construction and maintenance. The same phenomenon further demonstrates his contention that the future lies with the specialist. Of course, technical instruction and laboratory experiments alone can never make a man into an efficient highway engineer. Practical training is an absolute necessity, and such a training cannot very well be obtained otherwise than by apprenticeship to a recognised master of the craft. Moreover, highway authorities must realise that engineers with special training of the kind indicated cannot be expected to give their services without a remuneration which is commensurate alike with the expense of their equipment and the special skill which they will have attained in the exercise of their profession. This important point was duly emphasised. In concluding his paper, Mr. Boulnois referred to the fact that the institution had decided to institute a special examination for candidates in road construction. This step should do much to encourage some of our technical colleges to provide a course of study which will fit students to obtain this special diploma.

Fast Traffic: Its Effect on the Roads, and the Remedy.

By "CONTRIBUTOR."

In [illegible] "The Physics and Dynamics of the Road Traffic Problem," the editorial remarks on the writer's first article* bring out very clearly the difficulties which he or any writer on a novel subject must encounter when they attempt to use terms accurately descriptive of qualities or properties of matter. The note suggests that in the first article the term "elastic" is employed to describe a quality of road crusts in a special sense, and that what is really meant is a greater range of resiliency.

It will, however, be seen that in the editorial the word "resilient" is also used in a special sense. The note then shows the difficulty which exists in stating accurately the mathematical relations between the speed and the dynamic effects. However, it will be sufficient for the purposes of these articles to admit the serious effect of present speeds on our existing highways, and to discuss the extent to which these effects may be reduced and economic efficiency obtained, by increasing the resiliency of the three parts of the road structure, the wearing crust, the strength crust, and the foundation.

When the writer contributed to your columns his first series of articles in the latter part of 1911, two and a-half years ago, he suggested that our road crusts should be studied in two parts—(*a*) a wearing crust, and (*b*) a lower portion, which he called a strength crust, and then drew attention to the (*a*) crusts from 1½ in. to 2 in. thick, which had already been laid by various contractors, and which at that time possessed satisfactory results. This system of laying roads in one or two courses, using bituminous or asphaltic materials, at any rate for the upper or (*a*) crust, has since the writing of these articles been largely developed, and has, on the whole, been so favourably reported on by road surveyors that there are now available very full data as to their comparative durability in [illegible] of three years, and, what is [illegible] of importance up to the time indicated in total tonnage per yard width, corresponding to many years' wear of a country road, which shows that these [illegible] compare favourably with any that have been laid hitherto tried.

Naturally, the writer's attention has been chiefly directed to those first mentioned by him. The lengths laid down by the Cormastik Company at Sideup were followed by other experimental lengths on other roads, and the same may be said of the work carried out by the Roadamant Company and by others who employed substantially the same methods.

So far as the writer has been able to observe, in the majority of cases where over thin coatings have maintained a good, smooth, non-wavy surface it has been due to a certain degree of resiliency in the coating itself, and that these successful surfaces have differed from other bituminous surfaces where greater waviness has been observed chiefly in this quality of resilience. It may be said that at the present time means have been found by which our existing highways may be [illegible] successfully and economically coated with a bituminous wearing crust, not exceeding 1½ in. thick at the sides and 2 in. at the crown, which endures the speed effects of modern traffic in a remarkably successful manner.

The writer has been fortunate in being able to test the resilient quality of portions of these thin crusts cut from roads where the traffic has been taken, and where upwards of 1,000,000 tons per yard of width has passed over the road since the crust was laid down, and has successfully cut portions of these crusts and tested in various ways to ascertain, if possible, whether quantitative measurements can now be made in any way useful as a guide to engineers desiring to avail themselves of thin resilient qualities.

On examination these crusts showed that they closely resemble those originally described in the 1911 articles, as the material added to the mastic very largely consisted of stone chippings much larger than the coarse sand usually specified for American sheet asphalt surfaces. Herein these successful surfaces more nearly resemble the asphalt surfaces which have been frequently laid down on the Continent at Berlin and elsewhere under the name of Asphalte Coulé. They generally contain from 55 per cent to 60 per cent of coarse material, all of which passes the British standard ½-in. sieve, and is retained on the British standard ⅛-in. sieve with about 28 per cent to 30 per cent of material, all of which has passed the ⅛-in. standard sieve, the binder, calculated as pure bitumen wholly soluble in carbon bi-sulphide, varying from 10 per cent to 12 per cent. Slabs of this material cut from the road, and other slabs made up in the laboratory to imitate them exactly in composition, moulded to exact dimensions, 9 in. by 6 in. by 2 in. thick, were exposed to a bending test when resting on supports, the inner edges of which were spaced 7 in. apart, and the best of these were found to carry weights up to 1,400 lb., applied for a period of sixty seconds at the central point between the supports; the observed deflection on the unsupported length was then observed to be 0·04 in. When the pressure was removed the slabs returned to their original position, no permanent deflection being observed. The tests were carried out at a standard temperature of 55 deg. Fahr.: at lower temperatures the slabs carried more weight with the same deflection, and, naturally, at higher temperatures a reduced weight.

These tests may be of service in showing that, by using suitable bitumen and an aggregate approximating as above, a road surfacing material can be constructed which has definite properties, and that material possessing these properties has been found in practice to be less liable to permanent deflection than the sheet asphalt mixtures of the American type made up with finer material, and which apparently do not possess these properties to the same extent.

The writer has tried many times to obtain the same results, using the coal-tar pitches as a binder; but even when the pitch is mixed far too hard for road purposes he has been unsuccessful in producing slabs which would possess the smallest degree of resilience when submitted to the tests above described. In all cases the pitch-bound slabs yield gradually, even to light pressures, but the coefficient of restitution is nil.

It seems probable that in this quality of possessing a large coefficient of restitution within the limits of temperature that are usually met with at the surface of our highways in our climate will be found the true reason why the older asphalt pavements have been found to be so durable and withstand so well our weather, and wear and tear of traffic. At any rate, from recent reports that have been made to their councils by road surveyors who are studying this subject, we gather that they are now satisfied that good results can be obtained with a comparatively thin coating or carpeting of a resilient, bituminous-bound aggregate laid direct on to the new or partly worn surface of water-bound macadamised highways, and that no difficulty has been found in obtaining sufficient adherence between the upper surface of the road and the bituminous coating. It appears, however, that when the traffic is exceptionally heavy, so that it is necessary that the bituminous surface should have a greater thickness than 2 in., contractors have hitherto preferred, in most cases, to lay this bituminous coating in two thicknesses, "a" and "b," the lower coat "b" taking the place of the binder course suggested by Americans as necessary to be interposed between the wearing surface "a" and the rigid concrete support.

The writings of Clifford Richardson, Prevost Hubbard, Dow and Smith, and other American engineers expert in bituminous road construction, and the specifications that are now being regularly issued by American bureaux of highways, show that the use of this "b" or binder course is now fairly standardised American practice, and that the advantages of using this binder course are very marked. It not only serves as a resilient coat to cushion part of the shocks of the traffic which would otherwise be wholly borne by the "a" coat if the latter were laid direct on the rigid concrete foundation, but it is asserted that it is the best means of anchoring or attaching the "a" coat through the "b" coat to the upper surface of the concrete, and this is corroborated by certain contractors in this country who confirm that it is without doubt better to lay the "a" coat on a resilient "b" coat made up of somewhat coarser material than the "a" coat than to lay the "a" coat direct on to any

*The Surveyor, June 19th, page 980.

regard foundation. Although this double-coat work has been very successful, the writer believes that in practice it is found more difficult to lay it and to maintain it free from waviness than has been the case with the single thin coat laid direct on to water-bound macadam. It is not easy to point out the cause of this. It is possible that it is due to the well-known fact that hot material is not easy to roll free from waves in the first instance, and that this double-coat work has almost invariably been rolled, whereas the single-coat work has in many cases been trowelled and rubbed down to a level surface with spreads and straightedges, so that the work, when first opened to traffic, has been freer from initial waves than is possible in the case where the work was consolidated by longitudinal rolling.

Tests show that there is considerable difference between the density of the material produced by the two methods at the time the surfaces are completed and thrown open to traffic. The density of the trowelled work then approaches very closely to the density it will hereafter attain under the consolidation of the traffic; whereas with the rolled work the most skilled contractors prefer to finish the rolling at a point where the density is considerably short of that eventually obtained by traffic consolidation. It is possible that it is during this tender period of final consolidation that the road work is most liable to deformation by traffic; the attention of road surveyors is directed to this question, which seems to be of importance.

We now come to the much-disputed question on the comparative advantages of laying the road crusts that have just been discussed on the two classes of foundation—on the one side the stone-block foundation or the cement-concrete foundation, both of which may be said to possess considerable rigidity, or, on the other hand, on a continuous foundation made of wetted ashes rolled in successive layers up to any desired thickness, which is, to some extent, itself resilient.

At Sidcup the Limmer Company and the Roadamant Company laid their material direct on to a concrete bed, as is usual in the asphalt pavements in the cities of England and America, but the Roadmaster and Cormastik systems have since given excellent results with their material laid direct on macadam highways; but the year before last Mr. Lovegrove, the surveyor of Hornsey, decided to lay a most difficult section of Fortis Green-road direct on to a newly made foundation formed by rolling down successive layers of wetted destructor ashes until the desired thickness of 12 in. was obtained. This was carried out at a point where the road passed over a bed of clay, and which, when the road was in its original form of a macadam road, was found to break up, chiefly due to the clay working upwards through the macadam. Although the road was so narrow that the excavation of the clay, so that the required thickness of foundation might be laid, had to be carried on in half widths, it is found that the double-coat bituminous work—1 in. of "a" and 2½ in. of "b"—laid on this ash foundation has preserved its surface freer from waves and more perfectly, in every respect, than has been observed elsewhere in the same road, and certainly in better condition than where the same bituminous work rests on the original macadam or on the usual suburban road foundation of hardcore. In the latter case during the two seasons which have elapsed since this work was carried out, the usual slight subsidences have shown themselves followed by waviness on these parts of the road. No such subsidences and no perceptible waviness can be observed on the part laid over the rolled ash foundation. Here we have a case where, under identical conditions of traffic, that length of the road which in all three parts possesses resilient properties has distinctly shown its superiority over other parts where the foundation portion has been not so homogeneous and probably not so resilient.

There are many cases where destructor or furnace ash are available, and when foundation work of this class can be carried out at a far lower cost than would be possible with continuous concrete foundation. The writer believes that a good case has been made to show that such a system of road construction, if carefully studied and developed, may, and very probably will, yield almost ideal conditions of road construction, as it has undoubted advantages (1) as regards first cost and cost of annual maintenance, (2) accessibility for laying pipes, (3) affording good drainage, and (4) the property of minimising the vibration caused by traffic to the adjacent houses. In all these four respects a good case has been already made out for further trial, so that surveyors should pause before they commit themselves to heavy expenditure on rigidity and on the special and expensive forms of construction that rigidity entails.

N.A.L.G.O. AND SUPERANNUATION.

DEPUTATION TO MR. HERBERT SAMUEL.

A deputation representing the National Association of Local Government Officers waited upon Mr. Herbert Samuel, President of the Local Government Board, on Thursday of last week, in support of a scheme to form the basis of a Bill for providing superannuation allowances for all municipal officers and servants.

Mr. Homewood Crawford said it was desired to impress upon Mr. Samuel the grave injustice which was done to many thousands of municipal officers whose duties and responsibilities were constantly increasing.

Mr. Samuel, in replying, said the present position was one of much confusion. The deputation had a very strong case. Many important questions would, however, have to be solved. He proposed to draw up a statement and to communicate with all the great municipal organisations, asking them whether they would approve of an inquiry being held into the whole of this vast question, which involved immense sums of public money, as well as the contributions proposed by the deputation. He was not sure whether such an important matter should not be the subject of a Royal Commission, but upon that he would not say anything. In any case, he hoped the steps he was prepared to take would meet with their concurrence, and that the movement might be advanced a further stage towards its goal.

"HALF-WAGE" ROADMEN.

In the course of a recent meeting of the Wortley, West Riding, Rural District Council, Colonel H. S. Walker complained that his district, Wortley, was undermanned so far as the work of repairing the highway was concerned. He also urged, generally, that the highway surveyor (Mr. F. A. Crawshaw) should employ only able-bodied men.

The highway surveyor replied that he was under general instructions, in giving out employment, to keep as many poor people off the rates as possible.

The Chairman: Oh, no, I don't agree with you.

The Highway Surveyor: Well, I will not labour the point, but the relieving officer is constantly asking me to find a job for one poor fellow or another.

Colonel Walker said he did not want the highways to be a refuge for men who could not find work elsewhere.

Mr. Bingley: But we only pay them half a wage.

Colonel Walker: Pay them a proper wage, then.

It was resolved to call the attention of the Highways Committee to the matter.

Motor Traffic and the Upkeep of Main Roads.—In the course of the twelfth annual conference of the Lancashire Association of Urban Councils, held at Ulverston, Mr. W. H. Schofield, surveyor to the Lancashire County Council, gave an address on main roads, and dealt mainly with the financial side of the problem. The expenditure on the upkeep of the roads had gone up considerably in Lancashire. Although the Road Board had contributed £30,000 during the past three years, it was inadequate. The whole of the increased expenditure had undoubtedly been caused by the development of motor traffic, particularly motor wagons and motor chars-a-banc, which were now using the roads so freely and cutting them so badly. The heavy motor-vehicles emanated from the boroughs, the owners of the vehicles did not pay any rates at all towards the upkeep of the roads, and he did not think it would be inequitable to make the owners of these motor vehicles pay a substantial annual contribution towards the cost of the upkeep of the roads. Following a discussion a resolution was passed that the Main Roads and Bridges Committee of the county council should take into consideration the apparent injustice of the expenditure on through main roads being borne by the county council, and the non-contribution by the county boroughs.

Main Road Maintenance in Herefordshire.

By G. H. JACK, County Surveyor.

In June of last year the County Council of Herefordshire decided to adopt the direct system of road management except in one district in their area, but the county surveyor, Mr. G. H. Jack, points out in his annual report that it would not be quite correct to say that the main roads are now under the direction of the county council—for these reasons: (1) The district surveyors are still engaged by the district councils, and are only responsible in part to the county council; (2) the roadmen are engaged jointly upon the main and district roads; (3) the [illegible] partly by the county and district councils; (4) the details of the accounts are in the hands of the clerks or surveyors to the rural districts.

"In short," he says, "the full responsibility for the management and financing now rests with the county council; and at the same time the actual execution of the work still rests to some extent with the district councils acting as agents for the county council."

From the point of view of the district councils this arrangement had the advantage of placing at their disposal a better staff and plant for the maintenance of the district roads. Mr. Jack ventures to give it as his opinion that from the county council point of view the system does not hold out a single advantage; on the contrary, it was against the interests of efficient main road management. "It seems to me," he observes, "that from whatever point of view the position is approached, there does not appear any reason why the finances of the county generally should suffer by reason of Herefordshire falling into line with the other English counties in the important matter of highway administration."

The county surveyor remarks that the old method of maintaining the roads through contracts with the district councils may be said to have been a success until the advent of motor cars; from that time its efficiency steadily declined until March, 1913, when it became impossible and unworkable mainly for these reasons:—

"First, the ever-increasing traffic made estimating exceedingly difficult, the roads giving way where least expected, and thus jeopardising the granting of the annual certificates. The withholding of these certificates was most irritating to the district councils, and, incidentally, a most unpleasant duty for me. Naturally, the district councils used every endeavour to guard against their financial arrangements being upset, and this brought about an inflation of the estimates and a constant demand for extra allowances. Thus in the case of there being the least doubt as to a road being passed, applications for increased grants were made with very little compunction, with the result that large sums of money had to be granted, otherwise the withholding of my certificate might be dubbed unreasonable.

"Secondly, the important question of accounts, which is now receiving the attention of the committee, is another factor in the difficulties attending the old contract system and the present agency system. It is of the utmost importance that the responsible official should have ready access to all accounts in connection with the work under his charge. In my opinion serious errors are likely to be made, and in fact have been made owing to the accounts being kept in no less than thirteen offices, three of which are outside the county boundaries. If the expenditure is to be kept anywhere near the estimate the accounts must be kept at the Shirehall for frequent reference.

"Thirdly, it is common knowledge that much better terms can be arranged with quarryowners, hauliers, and others where large orders are to be dealt with, and I have proved this to be so in connection with the Road Board work, which is under my absolute control and supervision. Competition is very much keener than it would be if this work were to be split up for execution by the district councils."

Mr. Jack mentions that adverse climatic conditions in Herefordshire are more severely felt than in some counties. The greater part of the roads consist of thin coatings of granite resting on red clay, which, when wet, will not support heavy or even medium loads.

Effect of Engine Traffic.

Engine traffic continues to increase in the county. Where the traffic is heavy and continuous the roads are quickly ruined. In other cases where the traffic is not excessive the county surveyor finds the effect is almost as ruinous, inasmuch as the convexity of the road is destroyed and the side ditches so squeezed as to be in many cases useless for the discharge of the surface water; this obstruction facilitates the soddening of the clay under the road haunches which is pushed into waves by the first locomotive. "The loss in metal alone on these weak sides must be very considerable," Mr. Jack remarks. During the last few years he has strongly advocated large sized material, either limestone or slag, for the sides instead of the costly Cleo Hill stone, but it appears that his recommendations have been somewhat tardily taken up by some of the district surveyors, and in other instances they have been ignored altogether.

Weight of Traction Engines.

"There cannot be the least doubt," Mr. Jack proceeds, "that the axleweights carried by the majority of engines using the roads of this county are far in excess of what is allowed by the law. It will be interesting and instructive to watch the results obtained by the laying down of Messrs. Avery & Avelings' axleweight ascertainers, by means of which the separate weight upon each wheel or upon each axle of vehicles may be obtained, also the total weight of the vehicle and contents. The machines will weight up to 16 tons.

Reconstruction of Trunk Roads.

"The year just ended saw the commencement of the most important undertaking in connection with roads with which the county council has ever had to deal. The work comprises the reconstruction or partial reconstruction of about 22 miles of roads. The task of obtaining and hauling the necessary materials required is in itself a difficult and trying business. The several gangs of men and the steam rollers must be kept constantly at work if the best financial results are to be obtained. In many cases the quarryowners cannot turn out the material fast enough, which fact upsets the hauling arrangements and also the general progress of the work.

Altered Character of Road Repairs.

"The whole character of the repairs on the much-used roads has altered during recent years. In this county there is now not nearly enough attention given to early repairs of potholes. The work must be done in the early stages, and must be skilfully and methodically executed. The life of the trunk roads is now less than one-half what it was when I came into office seven years ago. I notice in several districts attempts are made to force chippings into the holes with a heavy roller; this is not only ineffectual, but very expensive. If my recent instructions are properly carried out there will be no need for the use of a heavy roller; the old idea of waiting until the road is in such a state as to need recoating is very much out of date. The trunk roads must be frequently patrolled by competent lengthmen, and all necessary repairs, however slight, attended to at once. The time is not far distant, and in fact has arrived in some counties, when the principal highways will need as much attention as a railway track.

The Need for Skilled Workmen.

"I am afraid that the pressing need for well trained and skilled roadmen is not recognised as it should be in counties like this where agriculture is the staple industry. The lack of skilled labour is everywhere apparent even in the richer counties. In Herefordshire the want of such men is becoming very serious. Modern methods are expensive, and unless the men understand their work there is every probability of much money being wasted. It must not be forgotten that the art of modern roadmaking is not more than fifteen years old at the most. To many people any sort of man will do for roadwork, the impression being that little or no skill is required.

"This is a great mistake. I venture to say there are not a dozen workmen in the county competent to act as foremen over gangs employed in the construction of waterproof roads. Most of the likely men for such work in this county are attracted by the higher wages paid in the industrial districts of Staffordshire and South Wales. It should be made known that

skilled labour upon the roads affords good prospects to a capable man, and that there is room in the county council service for a number of such men. A wage must be offered which will attract men who are sufficiently skilled to quickly grasp the elementary scientific principles of good road making. The extra wages paid would be recouped over and over again, if only by the reason that the work would be thorough in the first instance. It matters little how competent the chief surveyor or his staff may be, if the men who actually do the work are untrained, and consequently incompetent, the result must be unsatisfactory and costly into the bargain. It is quite impossible to get good work out of a bad workman, however much he is supervised. Intellect and labour taken separately are insufficient: what is wanted is a combination of the two, or as the motto of the Royal Agricultural Society has it, 'Practice with Science.'"

INTERNATIONAL FIRE SERVICE COUNCIL'S MEETING IN LONDON.

The International Fire Service Council's Executive, who comprise the delegates of the European committees and associations concerned in the subject of fire protection—which bodies together have a membership exceeding three million—have been holding a series of meetings in London at the invitation of the British Fire Prevention Committee. The meetings have been honoured by His Majesty wishing the council success; the delegates have been received on behalf of His Majesty's Government, who have entertained them at luncheon, when Earl Beauchamp presiding took the opportunity to express his appreciation of their work and its beneficial influence, and the London County Council has entertained the visitors, and afforded them numerous facilities. The whole of the arrangements for their reception were in the hands of the British Fire Prevention Committee, whose detailed programme for their stay was much appreciated, as was also the hospitality the committee was able to accord them, and it was generally felt by the foreign visitors that the manner in which they had been received in this country, both officially and privately, was quite exceptional, and the interest accorded to their work, and to that of their British hosts, most flattering, and augured well for the advancement of fire protection.

The work of the International Council, which was presided over by Commandant Meier, of Amsterdam (president of the council), included the technical arrangement of the proposed International Fire English-French-German Dictionary of 5,000 technical terms which the council will now be able to issue shortly, thanks to the liberality of an English donor who has offered to bear the cost of its production.

Arrangements were made for the holding of a full meeting of the council, and an International Fire Congress at Copenhagen in 1915, when questions relating to celluloid dangers, fire on board ship, petroleum dangers, and the formation of county or district motor fire brigades are to be under consideration. A considerable amount of administrative work also had to be attended to.

The visitors were shown the British Fire Prevention Committee's testing station at Regent's Park; the London Fire Brigade headquarters, where a special display was arranged for them, and a number of large buildings and factories in the Metropolis in which modern fire preventive measures have been adopted.

A special point was also made of affording the visitors facilities to meet the principal Government and municipal officials concerned with a view of interchange of experience. At the Government luncheon the principal permanent officials of all departments primarily concerned were present, including the leading officers from H.M. Office of Works, the Home Office, Local Government Board, Board of Trade, Board of Education, and General Post Office. The London municipal authorities were represented by Mr. Percy Simmons (Chairman London County Council Fire Brigade Committee), Mr. W. E. Riley, F.R.I.B.A., M.INST.C.E. (the superintendent architect), Mr. J. Ollis (the chief officer Public Control Department) and Mr. J. W. Restler, M.INST.C.E. (chief deputy engineer of the Metropolitan Water Board).

As to speeches, Earl Beauchamp's remarks on fire prevention in proposing the toast of "The International Fire Service Council," have special bearing on the work done in Great Britain, and claim the closest attention as being addressed to such an audience. He observed that the British Fire Prevention Committee had taken an active part in the work of the International Council, and they had also founded an important fire testing station, which had been taken as a model in other European countries and in the United States. Their tests were generally recognised, their influence had gone far towards affecting all questions of building and construction in England to-day, and it was a matter of special interest to note that for the very first time, in the course of last year, the actual loss of property in London, or the value of the property which was lost in London by fire, was less than the cost of maintaining the London Fire Brigade. So they had learned a great deal from the British Committee with regard to the use of materials and the knowledge of fire control.

The President (Commandant Meier) said the name of the British Fire Prevention Committee was known not only in England, but far over all frontiers on the Continent. They all knew the "Red Books" of the British Fire Prevention Committee, and they knew them to be of the greatest value to the fire service all the world round. And when he named Mr. Edwin O. Sachs, the founder of that committee. Hear, hear) whose energy and science and knowledge had directed its works during the past fifteen years, he was sure he spoke in the name of the whole International Fire Service Council when he addressed to him his most sincere compliments. To obtain what they of the council would wish to obtain, and to make the progress in their work which they aspire to do, it was necessary not only that they should interest themselves deeply in the great problem of their science, but it was of the highest interest that Governments and municipalities should give them their assistance and support.

Altogether the conference, besides doing useful technical work, was a remarkable achievement towards the general advancement of the all-important subject of fire protection at home, where the advent of a new era of scientific fire protective work may be said to have now arrived, and to enjoy official recognition.

Tar-painting of Roads.—Mr. S. Sutcliffe, surveyor to the Mytholmroyd Urban District Council, and patentee of a very successful road, footpath, and channel snow plough, has invented and patented a novel device for tar-painting roads by hand. It consists of a pail which distributes the tar in an even film over the road, and it is claimed for it that it always gives the same results, nothing being left to the discretion of the man using it. The tar is simply turned on, and the pail does the rest. The apparatus can also be fed by means of a flexible pipe direct from a tar-boiler.

The Withdrawal of Grants to Local Authorities.—In the House of Commons last week the Prime Minister was asked whether, in view of the decision of the Government to withdraw the promise of grants to local authorities, he would arrange that any costs to which local authorities might have been put in obtaining information in respect of the classification of roads should be refunded from the Imperial Exchequer. Mr. Herbert Samuel (President of the Local Government Board) replied that no such decision had been arrived at by the Government, and the point therefore did not rise. He understood the expenses were extremely small.

Housing and Town Planning: Compulsory Acquisition of Land. In the House of Commons last week the President of the Local Government Board was asked whether any local authorities in England and Wales, and, if any, which, had acquired land by the application of the compulsory powers contained in the Housing and Town-Planning Act, 1909; and whether he would state what prices were asked and what awards made in each case. Mr. Herbert Samuel said the only local authorities by whom land had been acquired under the compulsory powers in question were the Erpingham Rural District Council and the Corporation of Weymouth. In the former case the award was for £382 for about twelve and a quarter acres of land, but he had no information to show that the land was offered to the council at a price. In the Weymouth case the land was offered at £1,000. The award was for £831.

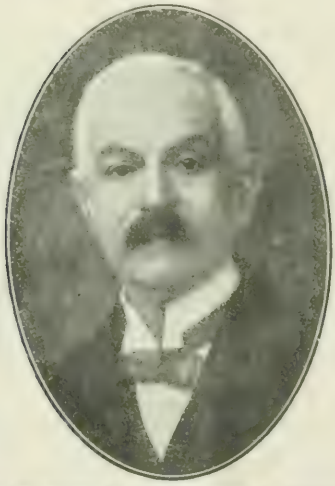
Institution of Municipal and County Engineers.

ANNUAL MEETING AND HOUSING AND TOWN PLANNING AND ROADS CONFERENCES AT CHELTENHAM—(2).

[illegible] Highway [illegible] the [illegible] paper [illegible] Mr. H. P. Watkins [illegible] Mr. [illegible] [illegible] [illegible] [illegible] Mr. Watkins [illegible] [illegible] Mr. Boulnois [illegible] Mr. Macnamara [illegible] Mr. Geo[illegible] was unable to be with them at the meeting.

THE TRAINING OF THE HIGHWAY ENGINEER OF THE FUTURE.

By H. Percy Boulnois, M.Inst.C.E.,
Past President.



You may [illegible] if you have read a letter on the above subject written by me and published in The Surveyor in December of last year, in which I pointed out that the change in the traffic of our roads may eventually result in developments which we can at present hardly realise; that the road of the future may be called upon to carry greater and greater weights at ever increasing speeds, and that more scientific methods will probably have to be adopted in the future for the construction and maintenance of our roads. I pointed out that formerly the only persons who criticised our roads were the road users, the ratepayers, and the "amateur experts," but that now their ranks have been strengthened by many chemists and technical experts who are taking a keen interest in the road problem, as they evidently see that there is a future for those who will examine the problem from the technical and scientific view as well as from the practical side.

I suggested that a new profession, that of the "Highway Engineer," was on the eve of formation, and that the question of the manner in which a member of this new profession was to be trained was worthy of consideration. At the same time I pointed out that technical calculations and laboratory experiments would not make good roads, as there are so many practical considerations which might tend to upset mere technical knowledge, but that if a highway engineer could combine this knowledge with his practical work he would no doubt be better able to cope with some of the problems of road construction, and that it seemed to be of the highest importance that this question of training should be carefully considered with regard to the younger men who will act as assistants and highway engineers in the future.

There can be no doubt that the introduction of self-propelled traffic by means of the internal combustion engine has entirely changed the problem as to the weights and speeds of the traffic which the road of the future may be called upon to bear. With horse-drawn traffic these weights and speeds were limited within [illegible] limits, but with modern traffic these limits are removed and no one can tell as to what weights and at what speed the traffic of the future may develop. It is true that legislation may from time to time impose restrictions on the traffic, as it has frequently done in the past, but the clamour of commercial needs and the popular outcry for increased means of transport will very soon break down any such artificial barriers to progress, and the highway engineer of the future will have to provide for these inevitable changes which are certain to take place.

The past evolution of our railways is one instance of the change that arose immediately mechanical methods of transport were introduced. The lightly constructed railway of the past has had to give way to a strongly built permanent way that will carry the enormously increased weights of the locomotives and carriages which are now imposed upon it, and the permanent way engineer has had from time to time to strengthen and improve his roadway in order to meet the ever-increasing demands made on him by the locomotive and rolling stock departments. It is by no means inconceivable that the highway engineer of the future will shortly be called upon to make similar improvements in his roads, and he will suffer from the great disadvantage of not having that control over the user of his roads which the railway engineer enjoys.

But, apart from this, we are already face to face with the fact that road construction is inevitably altering in its character. Where formerly there was but one form of construction for the ordinary road—viz., that which was known as "water-bound macadam"—there are now already a large number of different methods of construction, for all of which special advantages are claimed. It is evident that the "road question" has entered a scientific field never before contemplated, and that something more will be required of the highway engineer of the future than the mere rule-of-thumb experience of the past. The question consequently arises as to whether there is a necessity for specialising in this direction, or whether the ordinary training of a civil engineer is sufficient for the purpose. It may be argued that in the early days of civil engineering there was no special training available, and that the great engineers of the past demonstrated by their work that such training was unnecessary, and that many men of the present day have risen to the occasion and have approached the question of modern road construction on scientific and technical grounds, combined with their practical experience. This may be perfectly true, but if special training was unnecessary in the past, why was it that scientific training has gradually reached such large proportions at the present day, and that there should be the considerable number of colleges and universities which now exist, where very special scientific and technical knowledge is imparted? The law of supply and demand holds good in everything. If there had not been a demand for this special training of the engineer it would never have been so provided, and the engineering profession of to-day would be restricted to a few men of exceptional genius who perhaps require no such special training. The question is, therefore, Is there a demand for the special profession of the highway engineer, and, if so, in what manner should he be trained?

I venture to think that I have shown that there is already a demand for the special profession of highway engineering, but the manner in which the highway engineer of the future should be trained is not so easily answered. . . .

The United States of America has endeavoured to meet this question by giving a special course of training in highway engineering at the Columbia University in the city of New York, which might form the basis on which some such special training could be instituted in the technical universities and colleges of our own country. . . . There is a well-equipped testing laboratory for bituminous materials, and other testing laboratories in connection with the university, so

that the students can obtain a very thorough theoretical and practical training in highway engineering.

It would be a great advantage if the young highway engineer could also have some knowledge of either German or French. It is rather lamentable to notice that quite recently a road engineer admitted in the Law Courts that he thought a "metre" was only a foot in length. One would have thought that some knowledge of the metric system was an essential attribute of the engineer.

It may, of course, be argued that too much theoretical and laboratory experiment will not make road-men, but I do not think it can be denied that the young man who is equipped with a thorough scientific and theoretical knowledge of his subject should be better able to cope with the present-day traffic problems than one who is not so equipped. . . . I assume, however, that the technical training must be followed by practical experience, and there appears to be no better way of acquiring this experience than that of an articled pupilage under an engineer or surveyor who is responsible for the roads in his district. Intuition, common sense, originality, a knowledge of men and how to handle them, the value of materials, and many other subjects cannot be taught in the "school," and can only be acquired when the "rough and tumble" of the practical life is commenced, and it would be during his pupilage that the young engineer would acquire these necessary additions to his store of knowledge.

It may be justly argued that such a training as I have endeavoured to sketch out will require a considerable expenditure of time and money, and that the present emoluments meted out to the highway engineer are not commensurate with this expenditure. To this I can but agree: a training such as I have suggested should command better pay than that which is often grudgingly given to the man who is responsible for the construction and upkeep of roads which are every year involving larger and larger expenditure of money and skill in their maintenance. If the road of the future will demand more science for its well-being, it is only right that science should demand better pay for its work. The specialist should always be able to secure better remuneration than the ordinary practitioner, and this should hold good for the highway engineer of the future. . . .

I have endeavoured to show in this short paper that (1) A new profession—viz., that of the highway engineer—is on the eve of commencing; (2) he should receive a special training for the purpose of this new profession; and (3) that his services require adequate remuneration. If I have failed I can only quote from the lines of an anonymous philosophical poet, who wrote . . . in 1843:—

> "For every ill beneath the sun
> There is some remedy or none.
> If there be one, resolve to find it;
> If not, submit, and never mind it."

Mr. Boulnois added that he was glad to hear that the institution was thinking of holding separate examinations for candidates in road construction. Those men who presented themselves for this examination must have learned their work somewhere. He was hoping that many of our colleges and educational institutions would start classes on road construction. He found at Manchester that the University of Manchester had already been doing that, and for the past nine years they had had courses of theoretical and practical instruction on geology as applied to road construction.

DISCUSSION OF MR. BOULNOIS' PAPER

Mr. E. J. Stead said it seemed to him that there would have to be a very great change before the course advocated by Mr. Boulnois could be followed. It meant a change in the whole system of pupilage or articled apprenticeship that was now in force, and there would have to be a very considerable increase in the salaries paid in future. If young men entering the profession had to look upon the money spent upon their education as an investment, then he thought the salaries would have to be very largely increased. He was quite in accord with the principles which Mr. Boulnois had laid down for the practical as well as the scientific training of the highway engineer of the future, and he thought it would be most useful if some arrangement could be made by which the two could be combined.

Mr. H. F. Gullan (Belfast) said the point which struck him with regard to the technical training allied with the practical work was the difficulty which Mr. Stead had already mentioned with regard to the articled pupil. That difficulty might be met by shortening the period of the pupilage, and having the scientific theoretical instruction either prior to or subsequent to the pupilage period. The training of the road engineer would mean the adding of some scientific branches to the curriculum of the engineering colleges. Whatever might be done in that direction, the practical work must form the more important part of the training of the road engineer. Practical work could never be taught at college; a man could never be taught there how to set out a road to the correct levels, and the many incidental matters which arose every day with regard to practical road making, and the man who had not that practical experience, even if he had taken the highest passes in an examination, would find himself very much at sea when he came to do actual work. The result of this would be a practical training for a shorter period as an articled apprentice, and the remaining period of the training would be devoted at college to the technical part of the work.

Mr. Boulnois, in reply, said he quite agreed with both speakers that there were practical difficulties in the way. He would like to point out with regard to the cost of training that he had put this paragraph in his paper: "It may be justly argued that such a training as I have endeavoured to sketch out will require a considerable expenditure of time and money, and that the present emoluments meted out to the highway engineer are not commensurate with this expenditure. To this I can but agree: a training such as I have suggested should command better pay than that which is often grudgingly given to the man who is responsible for the construction and upkeep of roads which are every year involving larger and larger expenditure of money and skill in their maintenance. If the road of the future will demand more science for its well-being it is only right that science should demand better pay for the work." He particularly wanted to draw attention to that because he did not think the public were realising that the road engineer of the future must be a skilled man. He had pointed out in his paper what was the result of the introduction of steam on the railways. Just compare the railway of fifty years ago with what it was to-day. Every year the railway was called upon to bear heavier weights; so it would be with the roads. Every year the road engineer would be called upon to construct roads to bear heavier traffic. Mr. Stead had drawn attention to an aspect of this technical training for the road engineer which would cause a little difficulty. It would shorten the period of pupilage. But what he had pointed out was this: that the boy who had a technical training for his work would make greater advance than the boy who went straight into a road engineer's office without this preliminary scientific training.

At the resumed sitting of the conference on the following day (Thursday) the subjoined paper was presented:—

THE PREVENTION OF THE SUBCRUST MOVEMENT IN ROADS.

By E. S. Sinnott, M.Inst.C.E.,
County Surveyor, Gloucestershire.

[Mr. Sinnott was educated at Clifton College, and at University College, Bristol (now Bristol University). From 1886-89 he was a pupil of the late Mr. John Ward Girdlestone, M.Inst.C.E., chief engineer, Bristol Docks. From 1889-93 he was engaged on railway and dock work for the late P. Walter Meik, M.Inst.C.E., in London and Edinburgh, and in 1893 he designed the Bristol Industrial and Fine Art Exhibition. He was engaged from 1894-99 as resident engineer on the Port Talbot Railways and Docks, Glamorganshire, and from 1899-1907 was in private practice in Cardiff, principally in connection with railways, tramways, and road widening works for the Glamorgan County Council. He was appointed county surveyor of Gloucester in 1907.]

From time to time the writer has had under his observation the behaviour of roads subjected to heavy traffic, and he has recently initiated certain experiments to determine, as far as possible, the lateral and longitudinal movement of material forming the subcrust of highways. As a preliminary to more precise investigations, he has arranged, during the past few months, for various sections of grass verge adjoining the principal roads in Gloucestershire to be opened, and some of the results of such openings are shown in Figs. 1, 2, 3 and 4.

Speaking generally, these indicate that lateral movement, in some instances to a considerable extent, has been taking place, and such movement seems to call for special consideration.

The following examples will serve as illustrations:—
(1) On main road (Gloucester to Bristol) at Whitfield,

near Falfield. At this point the grass verges were opened on both sides of the road, and on the west side there was found, at a depth of about 4 in., a bed of broken limestone having a width of 3 ft. from the metalled surface, varying in thickness from 7 in. nearest the road to 4 in. at the 3-ft. distance. On the east side a somewhat similar state of affairs was found to exist, the width in this case being 2 ft. 6 in. from the verge. The subsoil is a hard, red clay.

(2) On main road (Bristol to Malmesbury) near Chipping Sodbury.—In this instance the lateral thrust is shown in the movement of a line of channelling formed of three stones on edge put in to protect the foot of a bank; originally laid with a horizontal face of 13 in. in width, the stones have been forced into a vertical position, having moved through an angle of 90 deg. In several instances the upper stones have been forced completely over, having rotated through an angle of 180 deg., and have fallen backwards into the highway, their movement away from the road being arrested by the bank they were put in to protect. The subsoil is clay.

(3) On the main road (Gloucester to Bath), between Hardwicke and Stonehouse.—In this case metalling and pitching have been found from 3 ft. to 5 ft. from the metalled surface, and about 18 in. in thickness. The subsoil consists of clay and sand.

(4) On the main road (Cirencester to Cheltenham) at Baunton Hill.—The opening at this place showed that the original pitching and oolite macadam had been forced for a distance of 4 ft. from the edge of the metalled surface, the outer end showing an upward movement. The subsoil is clay.

The results above described indicate generally the position of affairs upon roads where traffic is heavy, although in a small minority of cases investigated little or no movement could be detected. It appears evident, however, that where lateral spread does occur it cannot fail to be ultimately destructive, as without substantial and immovable support the top coating cannot be kept up to its work, particularly after some wear has taken place, and it becomes a question how far new surfaces of an expensive character are justified before the subcrust movement referred to has been arrested.

With a view to obtaining more accurate information, the writer has lately placed a number of iron bolts below the surface of certain roads, and has fixed their position exactly by steel-tape measurement; so that any movement can be definitely ascertained on a future occasion. He has also inserted measuring instruments, as illustrated in Fig. 5, at various places, which consist of two rods arranged to slide one over the other, having iron plates at their outward extremities, which will enable any movement, either lateral or longitudinal, to be recorded.

As a means of preventing the action above described, the writer has recently designed and put into use a rigid framing, the essential feature of which is that longitudinal and cross members placed at a suitable depth below the surface preclude any movement of the subcrust, and at the same time provide a means of constructing an impervious arch of tarred macadam to carry the traffic, great additional strength being provided by the longitudinal members for the support of the heaviest road vehicles. For various reasons the writer thought it best to construct the frames in ferro-concrete, although timber or other material could, if preferred, be used. The form adopted after one or two experimental frames had been made was that shown in Fig. 6. The longitudinals are 12 in. by 3½ in. (average thickness) by 12 ft. long, and are slightly tapered from top to bottom. The ends of the longitudinals are securely housed at the extremities of the cross ties. The reinforcement consists of expanded metal, 3-in. mesh, ¼ in. by $\frac{1}{16}$ in., weighing 11½ lb. per super. yard, cut into strips 9 in. wide—in the case of the cross-ties this is supplemented in a minor degree with wrought-iron round bars of small section at the ends of the same. A further modification consists of making the longitudinals slightly curved on the inside in order to withstand lateral thrust more effec-

Subcrust Movement in Roads.

travel, also, where traffic dies due to traffic may be anticipated, in placing the crossties in position they may be made in two parts and connected in the centre with a bolt or bolts.

In the experimental frames which have been put down the width between the longitudinals has been fixed at 8 ft.; but there is no particular reason for adopting this dimension other than that it appears suitable for dealing with the traffic conditions of rural roads in Gloucestershire, where most of the heavy weights are carried in the central portion of the highways. If considered advisable, a greater width than 8 ft. may be adopted between longitudinals, or, where traffic conditions justify it, the central pair can be supplemented by longitudinals on either side, connected thereto by cross-ties similar to those previously described. The frames have been placed as shown in Fig. 7, the top edges of the longitudinals being 6 in. below the finished road surface, which, from the information at present at the writer's disposal, appears the most suitable position for arresting the lateral movement; also, at this depth there would be little or no interference with pipes, and with 6-in. cover over the top side of the longitudinals, there appears to be sufficient cushion to avoid any damage thereto.

NOTE.—The method of preventing subcrust movement described in this paper has been provisionally protected.

DISCUSSION OF MR. SINNOTT'S PAPER.

Mr. J. S. BRODIE (Blackpool) said he took it that the whole idea of this invention was in some way to strengthen a very weak foundation. [Mr. Sinnott: That is so.] He did not know whether Mr. Sinnott had made any experiment in a regular hand-picked foundation or not. He should not think there would be much trouble in a hand-picked foundation under the road crust. His experience was that where they had not a hand-picked foundation, but a broken-stone foundation, there was considerable trouble, both laterally and longitudinally, and that was the cause of the corrugations in the surface where the foundation was not very strong. The great difficulty in keeping the surface in order with a water-bound crust was the corrugations. If they examined that to the foundations they would find that it was caused by the very weak foundations under the roads. He must say that the proposals which Mr. Sinnott had made there, and which he appeared to have patented, were very good substitutes for a regular, firm foundation. The great difficulty in rural roads was the enormous cost of putting in adequate foundations to carry the traffic, and if Mr. Sinnott had solved this economically by putting in something to take the place of a hand-picked foundation he would have earned the thanks of every road engineer in the country. He had very great pleasure in moving a vote of thanks to Mr. Sinnott for his paper.

Mr. H. PERCY BOULNOIS (Westminster) seconded the vote of thanks. He had read the paper with considerable interest, and he could confirm what Mr. Sinnott had said as to the lateral movement of roads. It would be found that in country roads, unless the haunches were well supported, there was a tendency to spread. That constantly occurred, and on almost every country road they found that, unless there was some strengthening for the crust. Looking at the diagrams, he wondered whether the foundations which were pushed out were the foundations of old roads which had been covered, and of which they had lost knowledge, because it appeared to him that the spreading was so abnormal and unusual. It certainly seemed to him much greater than it should be. The cure, to his mind, was a simpler one than Mr. Sinnott proposed—that was to put large stones in as strengtheners to the haunches. That had been done in many cases with good results. He would like to ask Mr. Sinnott whether he had tried that instead of this plan, which seemed to be expensive. He had tried the other plan himself with exceedingly good results.

Mr. R. OAKDEN (Newark Rural) asked whether there was any danger that these cross-ties would themselves cause corrugation. It appeared to him if the road had been worn four or five years, the road would give more than the places over the cross-ties and thus form a ridge.

Mr. W. GREGORY (Royston), said he was particularly interested in this sub-movement of roads, because for the last eight or nine years he had been dealing with it. At the same time, he did not think this method dealt with the cause of it. He thought the cause of it was the moisture in the sub-crust. He had a road which was in a bad condition. It was made over the chalk, and the road was always in a moving condition. After draining it, the road had stood all the heavy motor traffic of the district for four years without movement. He had some roads made on the clay with narrow gullies on the surface at the side of the road, and underdrainage had been equally effectual. He thought the only way to take away the cause of movement was to take away the water. With one of his roads, on cutting down, he found 4 ft. below the surface in the yellow clay streams of water running. That made the road in a putty condition. He realised that Mr. Sinnott's system was a very good attempt at dealing with a difficult problem. He would like to know how he would deal with this in a narrow road, what would be the cost per mile, and how it would interfere with the traffic while the work was being done.

Mr. T. CAINK (Worcester) said the trouble to which Mr. Sinnott had referred was by no means confined to country roads. He had had the trouble in old city roads to a considerable extent in this way, particularly during the rolling by a steam roller of roads with weak foundations. He could confirm Mr. Sinnott's observation that it was invariably in roads made on clay or marl, and he could also confirm the opinion of Mr. Gregory, that it was due to moisture in the foundation. It was often very difficult, and expensive too, to drain the subcrust under some circumstances. The effect of this lateral thrust had been to heave up the channels and kerbs against the footpath, and very often partially to ruin the footpath. The remedy he had applied was to put a concrete foundation under the channel and kerb, so as to give a strong wall to resist the lateral thrust. His fear of Mr. Sinnott's remedy was that he found it was when the weight came near to the channel that the greatest effect was produced, and if they attempted to steam roll a road arranged in the manner Mr. Sinnott proposed—partially tied in and the flanks unprotected—he would get the whole road in the same condition as it was originally. In fact, it was the outer edge of the road where the resistance abutments were required to be placed.

Mr. O. E. WINTER (Hampstead) said he gathered from Mr. Sinnott that where a curve existed in the road through a village there was no trouble arising from this lateral movement.

Mr. SINNOTT explained that the case referred to was rather a special case of a very narrow road with ferro-concrete path backed by houses, so as to secure absolute rigidity. They had the conditions obtaining there which he was seeking to obtain by artificial means.

Mr. O. E. WINTER (Hampstead) said he had no trouble such as Mr. Sinnott had spoken of. He had always had a kerb by the side of the road, and where it did not exist he should hesitate to put in a bituminous material without giving it the support of a kerb or channel. A kerb of 12 by 6 or 12 by 4 should prevent the lateral movement such as referred to, and he should not think it would cost more than the figure mentioned by Mr. Sinnott of £500 per mile. He should say they would get a kerb for the price, certainly for bituminous material a kerb of that kind was essential.

Mr. H. F. GULLAN (Belfast) supported the vote of thanks. He noticed that Mr. Sinnott brought before them the case in which the road was made on a clay subsoil, and apparently there was no form of drainage under the road crust. It appeared to him that the lack of drainage was the whole secret of the movement. There was the possibility of springs in the substrata, which might accentuate the trouble, but unless steps were taken to deal with the water in the subcrust of the road, even with the carrying out of Mr. Sinnott's suggestion, he might meet with trouble in the future. If the water remained, when heavy motor traffic came on the road, he would still find moisture gathering, and even the frames themselves would begin to bulge and sink in various ways. The system seemed to be intended to get over the difficulty of putting in a complete system of drainage under the road to relieve the water which was lying there, and then support the road against side thrust. He was inclined to think that a complete system of drainage would get over the difficulty.

Mr. A. P. I. COTTERILL (Bristol) wished to emphasise what Mr. Gullan had said, and to ask Mr. Sinnott two questions. Was there not a danger in making a rigid arch in the subcrust like this frame, if water was left in the road, of sinking and causing danger to the surface? Second—Could not the remedy be found by reinforcement laid over the

surface?

Mr. F. [illegible] thought [illegible] and [illegible] where [illegible] in the road. [illegible] one [illegible] and [illegible] and [illegible] was [illegible] and [illegible] and [illegible] and

an experimental stage with regard to this work himself. It was all open to modification as time went on. He honestly believed that the movement began in the middle of the road, because certainly in that county (Glos.) steel quite 90 per cent. of the heavy traffic travelled in the middle 8 ft. or 10 ft. of the road. Mr. Warner referred to the putting down of a kerb. This was really the same kind of thing. If a kerb would meet the case, then he said put in a kerb. But his experience had been that the kerb was not enough, and if they were going to get any movement at all they must go the whole length of the road and absolutely prevent it. He had overlooked Mr. Oakden's remark—and a very good one—that the cross-ties would produce a wave or undulation, or rather a wavy surface. If they looked at his drawings they would see the cross-ties were lower than the longitudinals. He put them lower so as to have a greater amount of cushioning. It was just a question how near the surface they could bring the cross-ties. If he found they did interfere they would be put lower. It might turn out they were rather too high, or it might be better to have a modified from of cross-tie. Then one speaker asked him how he should manage in a narrow road where they had considerable water finding its way to the subcrust. He should be rather inclined there to put down the method he had tried of having the cross-ties so that they could be in the middle. They could make their connections by overlapping, or it might be put in concrete in situ, and that would extend to the centre of the road. There were practical difficulties in the way of putting things of this kind in, but where that was serious the best thing was to make the cross-ties in two pieces, or put it in concrete in situ. One or two speakers raised the question of the difficulty of pipes in the roadway. The whole thing was 18 in. below the surface, and he did not think that would interfere with pipes to any material extent. His idea was that the pipes were considerably lower than that, and that it would not interfere.

A member said it was a question of putting in the pipes with the longitudinals.

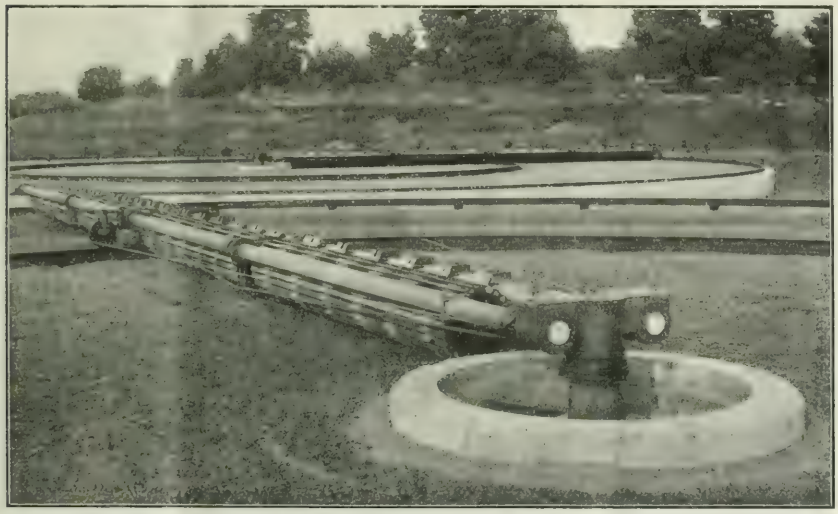
Mr. Sinnott said there would be one advantage if they did not carry out his system to the sides of the roads. Then he took it that it was becoming more common to put the pipes under the paths. They could not have a perfect road surface if they had to be perpetually cutting up the road for putting in or repairing pipes. One speaker had referred to the measuring arrangement. He did not know, but he imagined it might be possible to measure the pressure, but what he wanted first to get at was the rate of movement—was it ¼ in., ½ in., or 1 in. a year? His feeling was that whatever the movement was it was quite enough to let down the surface. Then they came down to the question of cost. He did not think in reason any cost was too great, if they could permanently have something below their road which could last them for all time. He was not referring to the frame itself, but to the cost of putting them in. The interest on the amount was £25 per mile per annum. One ought not to be baulked by the initial cost if they were going to keep up an expensive road surface. He did not propose to put in the recording instrument more than about 18 in. below the surface. He did not find any vertical settlement. On his roads with the heaviest traffic, 18 in. below the surface he did not find that the material was being pressed downwards. Apparently the movement was not vertical, unless the road was laid on a bog. He might say he had got one of the frames made, and it was lying on the road between there and Gloucester, about 2 miles distant. These ferro-concrete frames were absolutely rigid. They would arrest any movement likely to be initiated by the passing traffic. Of that he was confident.

(To be continued.)

THE "JANDA" SEWAGE WHEEL DISTRIBUTOR.

INSTALLATION AT CHELTENHAM.

The accompanying photographic view shows the type of sewage distributer in use at the Cheltenham Corporation's disposal works. They are the "JandA," manufactured by Messrs. Jones & Attwood, the well-known firm of hydraulic engineers at Stourbridge.



"JANDA" SEWAGE DISTRIBUTORS AT CHELTENHAM.

There are ten filters, each 101-ft. diameter, and the selection of distributors was made after searching inquiries, experimental tests, and finally of a test of nearly four years of two full-size distributors, before the remaining eight were ordered.

The chief points of advantage are that no small holes are employed, the edges of the waterwheel buckets throwing off the liquid in fine drops over the whole filter surface in very small doses, and at any rate of flow, while the feed weirs allow of exact adjustment to give even distribution over all parts of the filter at any varying rate of flow.

£125 Concrete Cottage Competition.—The result of the Concrete Cottage Competition organised by *Concrete and Constructional Engineering* will be made known in the July number of that journal, which will be issued to-morrow (Saturday). The exhibition of the 249 designs sent in will be held at the Surveyors' Institution (Lecture Hall), 12 Great George-street, Westminster, S.W., from July 6th to July 11th, between the hours of 11 a.m. and 6 p.m. The assessors, it will be remembered, were Mr. Max Clarke, F.R.I.B.A., Prof. Beresford Pite, F.R.I.B.A., and Mr. Edwin O. Sachs, F.R.S.(ED.).

Sewage Disposal at Leyton.

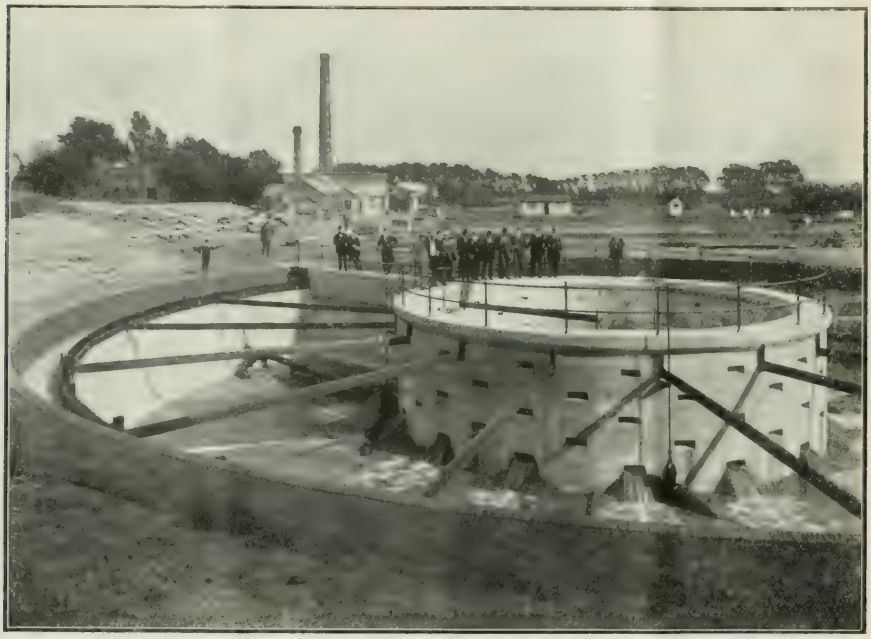
ADDITIONAL TANK ACCOMMODATION: GUILDFORD TYPE ADOPTED.

The method of the sewage at Leyton is to [illegible] passed through tanks. In storm times the storm waters are passed over [illegible] acres of osier beds adjoining. There is no [illegible] at the present time. The original tanks [illegible] were constructed in 1892, and cost £4,500. The population of the district was then 20,000, and the [illegible] of the tanks down to the sludge level was about 920,000 gallons. The daily dry-weather flow was, approximately, 600,000 gallons, or a maximum [illegible] gallons in six hours. This allowed, with one tank laid aside for sludging, for eighteen hours' rest for the day sewage and ten hours' rest for the night sewage.

In 1902 three additional tanks were constructed at a cost of £3,450, bringing the working capacity up to 1,710,000 gallons; the population had then increased to 40,000, with a dry-weather flow of about 1¼ million gallons, or a maximum flow of 660,000 gallons in six hours. This, allowing two tanks laid aside for sludging, provided for about twenty hours' rest for the day sewage. No extension to the tank accommodation has been made since 1892, although the population has increased to 128,000, and the daily dry-weather flow to 2¾ million gallons, or a maximum flow of 1,400,000 gallons in six hours. This is equivalent to filling five tanks in six hours, by the end of which time the first tank must be emptied, as there are usually two tanks standing idle for sludging. The time in which the sewage is allowed to stand in the tanks is therefore reduced to under three hours, and it has not become quiescent before the effluent has to be run off. As a matter of fact, during the past three months the available period of rest in these tanks during the whole of the twenty-four hours has only been two hours and ten minutes; so that it is a matter of impossibility to obtain an effluent at all approaching the standard attained previously. The present daily dry-weather flow is equivalent to filling twelve tanks, and five additional tanks of similar capacity to the present ones would now be required to give a tank capacity equal to one day's dry-weather flow. The provision of two additional rectangular tanks would give at work seven tanks, which would take nine hours to fill at the period of maximum flow, and this would increase the period of rest for the sewage in these tanks from two hours to between five and six hours.

The advisability of providing this additional tank accommodation was brought before the notice of the Public Health Committee on many occasions, and on March 8, 1910, Mr. Dawson, the then surveyor, presented a plan showing two proposed new rectangular tanks similar to the existing ones, and reported that he had taken out quantities and prepared an estimate of the cost of the work, which, including 5 per cent for contingencies, amounted to £3,360. In view of the negotiations then pending with the London County Council for connecting up the sewerage system of the district with that of the London area, it was felt advisable to postpone the consideration of this matter for a time. The negotiations culminated in the London County Council provisionally agreeing to take the sewage of Leyton, Walthamstow, Edmonton, Enfield and Southgate into the London system. The London County Council were prepared to receive and treat 50 gallons per head per day—that is, 6½ million gallons daily—but not more than 3½ million gallons were to be discharged in any six consecutive hours. This means that 3½ million gallons can be discharged directly into the outfall sewer, and 1¾ million gallons into the present tanks, making a total of 5,000,000 gallons, or 500,000 gallons less than twice the daily dry-weather flow. As the remainder of the storm water can only be run on to the 3 acres of osier beds adjoining, it is evident that additional storage accommodation will become compulsory when the system is connected with that of the London County Council.

Although Edmonton, Enfield, and Southgate have now withdrawn from the scheme which was formerly advocated by these authorities, there has been no suggestion that Leyton and Walthamstow should follow the same course, and the representatives of Leyton and Walthamstow are now in communication with the London County Council for the purpose of



NEW CIRCULAR TANK AT LEYTON SEWAGE WORKS.

arranging terms as confirmed to the two authorities, indeed reviving the original proposition for dealing with Leyton and Walthamstow. The altered terms, if any, will only be of a financial character, and will in no way affect the limit as above stated.

It was felt that advantage should be taken of these circumstances to make immediate provision to some extent for this necessary increase in the tank accommodation and utilise it for the present to assist the precipitation process, thereby enabling an increased length of time to be allowed for the sewage to stand quiescent before being discharged into the effluent channel. It is not desired to contend that the increase in the tank accommodation can enable an effluent capable of meeting all future requirements to be turned out, but it is felt that the addition will assist in turning out a better effluent than at present, and help to tide over the difficulty until the negotiations, which have now been extended over a considerable number of years, can be completed for the discharge of the sewage at the London outfall. In November, 1912, the committee's attention was called to the circular tank constructed at Guildford at the end of 1910, and to the advantages of this design compared with the existing rectangular tanks—briefly as follows:—

(1) The tank does not cover so large an area of ground as would be required for the two rectangular ones.

(2) It is cheaper to construct, requiring 30 per cent less respectively of brickwork, of concrete, and of cement rendering.

(3) The sewage has a more equable velocity through the tank, being obliged to flow in an upward direction and to travel from the centre to the circumference.

(4) There is better clarification or subsidence, and where chemicals are used a better result for the same quantity used per gallon.

(5) The solids are not disturbed by the inflow, but are deposited in sludge pits, where they can be regularly and easily removed.

(6) The tank has always the same capacity, owing to the facilities provided for the periodical removal of the sludge and scum.

(7) The large weiring surface allows increased volumes of sewage to be dealt with without disturbance of the scum or solids, ½ in. over the weir being equal to the full area of the 2-ft. 6-in. inlet pipe.

(8) No aerial nuisance is created, owing to the tank never requiring to be emptied for sludging.

In December, 1912, the chairman of the committee and the engineer, Mr. Ernest H. Essex, ASSOC.M. INST.C.E., visited Guildford, to inspect the tank at work there, and a plan was afterwards submitted for a tank at Leyton on similar lines, and instructions given to prepare working drawings for same. These were submitted in February, 1913, with an estimate of the cost, amounting to £2,255, not including royalties. The council advertised for tenders to be delivered at the council meeting held on May 27, 1913, and the lowest tender—that of Messrs. W. Manders & Co., for £2,236—was accepted, subject to the sanction of the Local Government Board being obtained to borrow the money.

The comparative cost of construction only, based upon the actual prices in the accepted contract, of two rectangular tanks, compared with the circular tank is as follows:—

	Two rectangular tanks. Capacity 250,000 galls. each. Cost.	Circular tank. Capacity 500,000 galls. Cost.
	£	£
Excavation	587	382
Concrete	681	452
Brickwork	132	92
Rendering	300	214
Scum-boards	15	30
Effluent and outlet pipes	95	197
Sludge and inlet culverts	252	119
Valves and ironwork ...	400	650
	£2,562	£2,136
Contingencies	138	100
	£2,700	£2,236

The nature of the subsoil, however, was such that the ballast lay 11 ft. 9 in. below the surface, below which depth it was all ballast and sand, which would not have been available had the two rectangular tanks been constructed, and the extra cost of this more than pays for the royalty of £250 paid to the patentees of the tank.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Why is it that at the meeting at Cheltenham there was such a large attendance of delegates at the Town Planning Conference and such a relatively small attendance at the Roads Conference? Was it because the delegates attending the former conference were able to charge their expenses to the rates, whereas those attending the road conference were unable to do so? Is not the question of good roads quite as much a national question as that of town planning?

* * * *

Was it not stated by the surveyor to one of the smaller local authorities, during the discussion on town planning, that in the district he represented, if he purchased a couple of spades and a few buckets for his sewage farm it affected the rates? And was he not understood to say that a 1d. rate in his district produced the large sum of £3 10s.?

* * * *

Was not Mr. Sinnott's suggested reinforced-concrete frame to prevent subcrust movement in roads rather an heroic method of dealing with this problem? And would not the more simple expedient of strengthening the haunches with either a deep kerb or large stones be sufficient?

* * * *

What will be the result of making all the past-presidents of the Institution of Municipal and County Engineers ex-officio members of the council? Will they not swamp the ordinary members of council, or will their age and distance from London prevent their attendance at the council meetings? On the other hand, should not their "ripe experience" be of some service to the council in their deliberations?

* * * *

What is the reason that the Benevolent Fund of the institution is so little supported by the members? Is it a fact that only about 13 per cent of the members subscribe to the funds? And will the Ladies' Committee, which was formed at the annual meeting of subscribers held at Cheltenham be the means of inducing a far larger number of members to subscribe to this useful and excellent movement?

* * * *

Was it not very interesting to hear from Mr. Hadfield, of Sheffield, that, notwithstanding a very large amount of motor-omnibus traffic in that city, the annual cost of maintenance of the roads had decreased considerably? And were we correct in assuming that this was mainly due to the improved bituminously bound roads which had superseded ordinary water-bound roads?

* * * *

What progress has been made with Dr. Gilbert Fowler's process for oxidising and coagulating sewage with the "M7" organism, and treatment with air? Have the experiments yet shown that this proposed treatment can be adopted on "commercial lines," or is it still in the stage of experiment? If these experiments prove a success, will not this process reduce the area of land now necessary for costly works of sewage purification, and will not the effluent obtained meet the most stringent requirements?

* * * *

Has anyone tried the experiment of lightly tapping with an umbrella or walking-stick the seat of a railway carriage? Would he be surprised that in a very few minutes he can cover the seat with about $\frac{1}{8}$ in. of dust? And when will the railway companies adopt a more sanitary covering for the seats of their carriages, and avoid "stuffing" and upholstery as much as possible?

* * * *

What is meant by "speeding up" the Local Government Board, which the newspapers say is the aim of the present President? Was it not the late President of the board who was always talking about "efficiency," and will not the board under these two Presidents attain such a high standard that even the War Office will be placed in the shade?

* * * *

Who was the poet who wrote the following lines?

What though the town be large, the buildings tall;
Neglected, ill-paved streets will spoil it all.

And is there not much truth in this philosophical poetry?

Why should one ever buy an evening paper when the posters are so much more thrilling than the contents?

Chicago Sewage Disposal and Water Supply.

[Extracts from the report of the Board of Experts appointed by the Chicago Real Estate Board, and consisting of Dr. G. A Soper, of New York, and Messrs. J. D. Watson and A. J. Martin, MM.INST.C.E., of England.]

The [illegible] plan of [illegible] and [illegible] is based on the [illegible] Lake Michigan [illegible] and [illegible] and that the purity of the water can be secured if [illegible] sewage is prevented from flowing directly or indirectly [illegible]

[illegible] have been built to dispose of the [illegible] on the theory that it would be [illegible] the sewage, the entire sewage of the city into the Chicago River, and flush it with a certain amount of diluting water from the lake, by means of the Sanitary Drainage and Ship Canal, into the Desplaines River system, which ultimately empties into the Gulf of Mexico.

It appears that the theory underlying the plan of disposal was [illegible] was decided upon before the works were constructed, and the organic law providing for the creation of the sanitary district specified the allowance of water which was to be provided for diluting purposes. It has been stated since the canal was built that the ratio of sewage to water required for the disposal of the sewage represented a minimum, not an average or maximum, figure, and that it referred to the sewage of a mixed residence and business territory from which unusual amounts of troublesome trade wastes were excluded. The accuracy or otherwise of the statements has little bearing on the situation. The conditions of sewage disposal which exist in the Chicago River and its outlet are conceded to be unsatisfactory, and it is the opinion of your board of experts that the disposal of the sewage cannot be made to answer the reasonable demands of sanitation without radical improvement.

DISPOSAL BY DILUTION.

The disposal of sewage by discharging it into a natural body of water, as is done by Chicago, is termed "disposal by dilution." This is the most common method of disposal in America, and there are many instances in which it is employed without producing serious nuisance or injury to health. On the other hand, there are many cases in which nuisance and harm to health have resulted, and it has become the growing practice of cities to divert their sewage from watercourses into which their drainage formerly discharged and carry it to more or less distant points for treatment. Under such circumstances the form of treatment varies from the removal of the grosser suspended particles which may cause offence to sight and the removal of the suspended solids which are capable of depositing in the water and producing offensive odours to filtration and the oxidation of a large part of the organic impurities. In but few cases has it been found possible to utilise the manurial ingredients either by applying the sewage to agricultural land or by extracting them and preparing a commercial fertiliser. However possible it may be in future to recover the useful ingredients of sewage, it is now universally agreed among sanitary experts that the first and controlling object should be to dispose of the sewage without injury to health or the creation of nuisance.

IMPORTANCE OF PREVENTING NUISANCES.

In recent years the prevention of nuisance has been recognised to be of large and increasing importance. In considering the existence of objectionable conditions in the Chicago River and its outlet, it is necessary that a clear understanding be arrived at as to what conditions constitute a nuisance. The word "nuisance" represents a conception which does not admit of precise definition. The courts have frequently been called upon to deal with it, and sanitarians are compelled to face it in innumerable forms.

Generally, a nuisance may be considered as a condition or set of conditions working harm to one or more persons through an assault or offence to the sense of decency, propriety or comfort. The effect is positive, not slight or partial. An odour or a sight which seriously disturbs the peace of mind which is necessary to the ordinary vocations of life may constitute a nuisance.

Obviously, what is a nuisance to some may not properly be called a nuisance by others, there being marked differences in susceptibility to the disturbing conditions among persons of different sensitiveness. [illegible] does not [illegible] and [illegible] of the facts should be arrived at, and the susceptibility of the average person who is affected must be accepted as the gauge.

It is worthy of remark that a nuisance cannot exist without reference to those persons who may be affected by it. The putrefaction of sewage may proceed to the point where the most foul-smelling and other objectionable consequences are produced; but if there is nobody in the vicinity the conditions cannot be said to constitute a nuisance. Conversely, a very small amount of putrefying sewage in the midst of a crowded section may be so objectionable as to constitute a nuisance in the fullest sense of the word.

NUISANCES FROM CHICAGO SEWAGE.

In the light of foregoing remarks it must be obvious that the putrefaction of sewage should not be permitted in the closely built up sections of cities, but may be allowed to proceed in rural districts remote from habitations or places of work, and not passed by vessels or vehicles of transportation by land.

Applying the conception of nuisance here described to the condition of the waterways of Chicago, it may be said that nuisance exists in various places in the contributing arms of the Chicago River and not to a considerable extent, so far as the personal observations of your board of experts have extended, in the main channel from the lake to the drainage canal. Practically the entire watershed of the Chicago River is populated or soon will be built up. The drainage channel flows through the open country for many miles, and its condition, although observed to be foul by those who have had occasion to visit it, does not constitute a nuisance for the reason that none is compelled to reside or work within the sphere of its offensiveness.

Some modification in the ordinary acceptance of the term should be made at the present time in considering the application of the term "nuisance" to the Chicago conditions. The condition of the waterways, however, is relatively so much better in most places than formerly that the public may be expected to be generous in their criticism. Complaint is not likely to be so vigorous where a decided change for the better is seen to have been made. In course of time, however, it may reasonably be expected that the sanitary standards of those who are now lenient may become more exacting, so that it will not be safe to assume that Chicago's waterways can properly be allowed to be more polluted than the waterways of any city where the education and intelligence of the public are at a high level.

RESPONSIBILITY FOR NUISANCE FROM SEWAGE AND FROM TRADE WASTES.

There is another consideration which in some degree mitigates the exceedingly foul condition of some of the city's open waterways. Odours of a peculiarly offensive and pervading character exist from certain industrial establishments in close proximity to points of excessive sewage pollution. The pollution adds to, but does not create, the original offence. From the standpoint of some it is far less objectionable to maintain the sewage nuisance in the presence of the greater trade offence than it would be to maintain that in the best residence or business districts.

Excuse upon this ground is fallacious. The existence of one nuisance cannot condone another; nor is it reasonable, where many persons are affected, to aggravate an offensive condition of the atmosphere by the addition of another. Aërial nuisance may or may not be prevented. In so far as it relates to the pollution of the waterways by sewage which, for other reasons, can and should be disposed of in a sanitary manner, nothing short of radical improvement should be regarded as satisfactory. A municipality cannot equitably insist upon the prevention of an aërial nuisance from a manufacturing establishment if the sewage is not properly disposed of.

Nor does it make much difference whether the pollution of the open watercourses is due to public sewage

or trade wastes. If the wastes are recognised to be a public charge, it is incumbent upon the public officers to dispose of them. If responsibility for wastes devolves upon the manufacturing establishments, it is but reasonable to require that the proprietors of the establishments shall dispose of the wastes without serious harm to the public welfare, or pay the municipality for disposing of them.

QUALITY OF THE WATER SUPPLY.

The vital statistics of the city have been quoted to your board of experts to show that the present method of sewage disposal unduly protects the drinking water against infection. The lowered death-rate and the typhoid death-rate have been taken to indicate the measure of this protection. The vital statistics of Chicago have been compared with those of large cities whose drinking-water supplies have been filtered, and it appears to have been shown that Chicago has one of the cleanest and purest waters of any large city in America. It seems unnecessary in this place to review the evidence or inquire whether all the improvement in the death-rate and typhoid rate is to be ascribed to the water supply. It is sufficient to remark that there seems generally to have been sufficient protection afforded up to the present time.

The method of disposing of the sewage is not the only protection which has been taken against the transmission of disease by means of the drinking water. The intake cribs, of which there are six, have been extended further and further out into the lake until one is about 4 miles from shore. If the reversal of the flow of the Chicago River is complete, and no sewage is discharged into the lake, it is difficult to understand the necessity for placing the intakes so far from the land. Again, it is not apparent why one of the intakes should be 4 miles from shore and the others between 2 and 3 miles from the land. Apparently the object in placing the intakes out as far as practicable into the lake has been to avoid not only contamination along the water front, but to get water which is clear. At times of storm the water of Lake Michigan becomes turbid near shore, clay being conspicuously present. After fresh easterly winds even the best water obtainable from the 4-mile crib becomes noticeably turbid.

As a means of protecting the water supply against occasional and accidental pollution from vessels which may have occasion to pass near the intake cribs, steps have been taken to place tanks upon the boats to receive their sewage. Arrangements have been made at some of the intakes for the application of hypochlorite as a temporary or permanent procedure. It appears from statistics collected by the health department that those parts of the city which have been supplied with this disinfected water have been particularly free from typhoid fever.

CONDITION OF THE DESPLAINES AND ILLINOIS RIVERS.

The condition of the Desplaines and Illinois rivers with respect to pollution has produced a strong impression on the board of experts. On the days when the inspections were made the water was offensively polluted with sewage as far as Ottawa—85 miles from Lake Michigan. Where bridges crossed the stream it was possible to see unmistakable evidences of the sewage. Odours were noticeable, grease lay upon the surface of the river, dead fish were numerous, and large quantities of sewage fungus were observable in the water. Disagreeable odours were noticeable at a distance of nearly one-quarter of a mile from the Marseilles dam. Above this point your board is informed that animal and vegetable forms which are natural to a normal river are absent. Through the whole course of the stream from Chicago to and below Ottawa gulls were seen feeding on the solid refuse which the sewage brought down. That Joliet and other municipalities along this watercourse discharged their sewage and industrial wastes into the water, and that the condition of the stream is now better than it was in former years, does not excuse Chicago for discharging the sewage, which forms the great burden of polluting matter observed.

OPINIONS AND SUGGESTIONS.

To the foregoing brief statement of the situation as it is now regarded by your board of experts the following opinions and suggestions are added:—

Dilution alone cannot be relied on as a permanently satisfactory method of disposing of the sewage of the district. It offers an insufficient means of disposing of the sewage at the present time, and would prove still more inadequate in the future, in spite of the full quantity of water which the drainage channel can carry. It will ultimately be necessary to treat practically all the sewage before it is discharged.

The procuring of a satisfactory water supply by diverting the sewage to the drainage channel, and extending or altering the location of the intakes, is not capable of furnishing a drinking water of assured quality. For the protection and improvement of the supply the city should look forward to the construction of filtration works.

The conditions of sewage disposal and water supply which now exist are not so insanitary as to call for improvements which will involve immediate and large expenditures of money. Conditions which are insanitary in the extreme exist in places, but they can be corrected without excessive cost. The great need is for a definite and carefully worked out sanitary policy for the future.

The disposal of the sewage by discharging it into the drainage channel after suitable preparation, the protection of the water supply by diverting the sewage from the lake, and the maintenance of conditions in the Chicago river suitable for navigation, are closely connected subjects, and the provisions to be made in future for sewage disposal, water supply and shipping should be worked out with this fact clearly in mind.

The preparation of comprehensive plans for sewage disposal, water supply and river development should be undertaken immediately. In order that this work may be of greatest service it should be based on a thorough knowledge of the existing conditions of population, residence and industrial development, sanitary requirements, and in accordance with careful estimates of the future of the city. Generous support, including abundant appropriations of money, should be given to the investigations, planning and other scientific work which may be necessary in this connection.

SOME RECENT PUBLICATIONS.*

WATERWORKS ENGINEERING. By Fred. C. Uren, M.INST.C.E., Ireland Silver Medallist in Civil Engineering, engineer and surveyor, Aldershot Urban District Council. Price 10s. 6d. nett. Bristol: Castle Litho., Limited.

It is perfectly true that there have been published a large number of books on the subject of waterworks engineering, but, as the author says, the chief merit of some of these books lies in trying to obscure the subject with elaborate engineering formulæ that benefited few persons who were not familiar with the calculus. Mr. Uren has avoided this in the excellent and practical work which he has written, and any student or engineer with a slight knowledge of ordinary mathematics can readily grasp the various simple and useful formulæ contained in the book.

The author, in simple language, covers a great deal of ground, from rainfall on gathering grounds, through reservoirs and dams, up to mains and distribution, with useful chapters on rivers and streams, well-pumping, gauging and geology. Very few words are wasted, and the information given is sound and useful. The illustrations are well done, and not too elaborate in character.

It would be impossible in a short review to particularise the excellent manner in which Mr. Uren has dealt with his subject; but his chapter on "The Flow of Water in Pipes and Channels," and his explanation of the "hydraulic mean gradient" is a type of the simple and explanatory manner with which he deals with a subject which is so often terribly confused and unattractive to the student or practical engineer. We congratulate Mr. Uren on his book, which should be on the bookshelf for reference by anyone who has to deal with the question of water supply on either a large or small scale. We know of no book hitherto published which is such a veritable *multum in parvo* on the subject of water engineering.

CONTINUOUS AND ALTERNATING CURRENT MACHINERY. By S. H. Morecroft. Price 7s. 6d. nett. London: Chapman & Hall, Limited.

This work is, as described in its subtitle, an elementary text-book for use in technical schools. Its appearance is justified by the increasingly important place which is being taken by applied electricity as a subject of technical instruction. The author has kept in view the importance of simple, non-mathematical explanations of the behaviour of the various machines

*Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

[illegible] Series.

SLATE BEDS AT HALSTEAD.

ECONOMICAL WORKING.

Members of the Essex branch of the Sanitary Inspectors' Association made an inspection on the 29th ult. of the Halstead Urban District Council's sewage works, a feature of which is an installation of Dibdin's slate beds, the successful operation of which [illegible] instrumental in effecting a saving of from £300 to £400 on the previous working expenses.

Mr. J. V. Dorey, who was among the company present, furnished some particulars with regard to the works, the expenditure of which, it was stated later, had amounted to only £1,800. The population of Halstead was about 9,000, and the problem set the council was to do away with the nuisance created by their farm, of which there had been many complaints, more particularly with regard to the sludge. The situation was becoming dangerous, and the council were running a great risk of having an injunction served upon them by the owners of the surrounding property in consequence of the great nuisance existing. Their endeavour was to avoid putting down an expensive scheme such as would necessitate a loan to be sanctioned by the Local Government Board, and they simply contented themselves with overcoming the nuisance at the least possible cost.

Mr. J. P. Humphrey (Reigate) said he would like to know the extent of the ill effects of the tannery waste upon the working of the slate beds in destroying the animal life, the essential element of the scheme.

Mr. Dibdin replied that this depended upon the nature of tannery waste, as in the case of lime it would be precipitated in the grit chamber and little harm would be done; that in the case of Halstead, however, the tannery waste was to a certain extent counterbalanced by the waste from the brewery. Replying to other questions, Mr. Dibdin said the beds were never cleaned out, as they could not be choked, and explained that excessive use, instead of choking the beds, changed the bacteria process to a liquefying one which prevented choking.

Mr. W. A. Nicholson, the surveyor to the council, added that they only filled one of the six beds at a time.

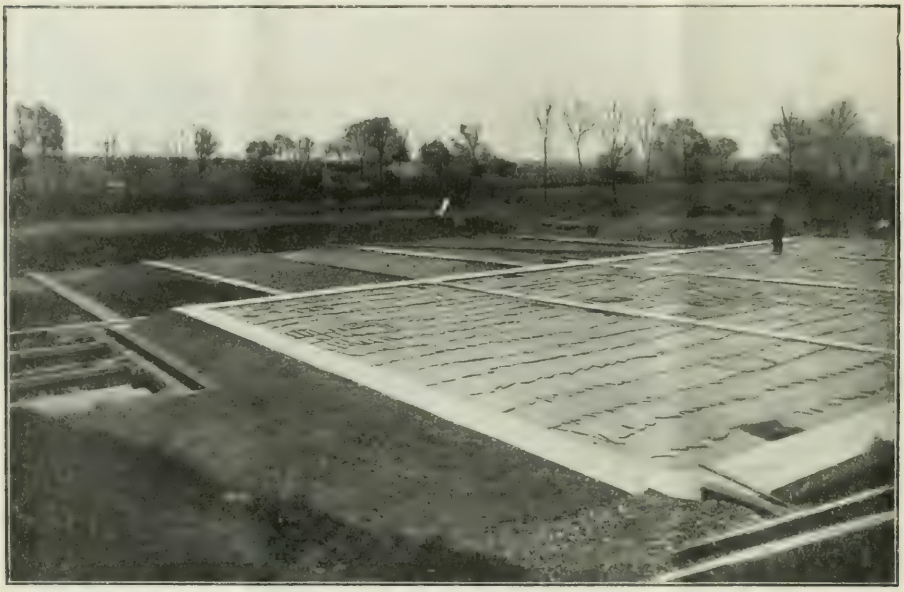
Mr. Dibdin said Halstead did not possess a complete scheme. In some places they had to put in storm beds. Every place had to be treated according to its circumstances. For instance, at Halstead the slates were 2 in. apart, and in some they might be 4 in. apart, or only 1½ in.

Mr. H. W. Webb (Epping) inquired how chemical waste could be dealt with.

Mr. Dibdin replied that if the chemicals were so strong that they killed the worm life in the beds the system would naturally fail without preliminary chemical treatment, but he had not met such a case, as the chemicals were in solution, and the slate bed had to deal with matters in suspension which were being constantly digested by the biological organisms immediately after the solids had settled and when the liquor containing the chemicals had been drawn off, leaving the solids resting on the mudlayers in the presence of air. The system could be tested at home by putting the sewage daily in a certain quantity on to a bed even a few inches only in extent. They had not come across any cases with which they could not deal, although difficult problems were presented in large manufacturing towns.

Mr. Webb said at Oldbury the main sewer became choked with the chemical solids, and Mr. Dibdin pointed out that such heavy chemicals could be settled in a grit chamber before the sewage passed to the beds.

Mr. Nicholson observed that they had been working for five years and only one filter-bed had had to be taken off during the time. The slate beds had not choked at all.



HALSTEAD SEWAGE WORKS. VIEW OF SLATE BEDS.

The Road Board. The Chancellor of the Exchequer was asked in the House of Commons on Monday (1) what is the staff of the Road Board, and (2) how many meetings of the Road Board were held in 1913-14, and whether he would give a list of the attendances of the members. Mr. Lloyd George said the permanent staff of the Road Board is as follows—namely, secretarial and clerical, twenty; engineering, seven. There are also two consulting engineers, one of whom is employed for Scottish work, and a temporary staff of nine, employed mainly on the classification of roads. Seven meetings of the board were held in the year ended March 31, 1914. The chairman and one other member attended all of the seven meetings, two more attended five each; one, who was only appointed in July, 1913, attended four, while Sir Charles D. Rose attended the only meeting held before his death.

INSTITUTION OF MUNICIPAL ENGINEERS.

SOUTHERN DISTRICT MEETING.

A meeting of the Southern District of the institution was held at the institution offices on Wednesday, June 24th. After the business meeting had been concluded, Mr. T. C. Barralet read the paper "Temporary Buildings in Relation to By-laws," which had been presented at the last annual meeting, and discussion of which had then been adjourned. [See THE SURVEYOR, November 14, 1913.]

Mr. Horace Boot, president, occupied the chair, and, in proposing a vote of thanks to the author of the paper, expressed the opinion that a short paper such as that read by Mr. Barralet was often the best. He quite agreed with the author that galvanised iron buildings were not the class of temporary building that should be practically insisted upon by the Local Government Board. Such buildings should, as a matter of fact, be discountenanced in every possible way, as unsightly and a blot upon any landscape. He mentioned, too, the deplorable extension in recent years of bungalow towns, which had ruined the foreshore of more than one seaside resort. Old railway carriages, with sundry leans-to, were largely in use as week-end residences, and some limit should be put to their erection.

Others who joined in the discussion, which was of quite an informal, round-table order, were Messrs. Thomas Mundy, John Taylor, Arthur Palmer, and A. J. Elson.

Mr. Barralet, in reply, said that galvanised iron buildings were the outcome largely of a craze for cheapness. The Model By-laws were responsible to a great extent for the existing condition of things as regards temporary buildings. They were not on a sufficiently wide basis for country places. Proper accommodation was not provided by owners of property for the poorer tenant, who was compelled to put up small lean-to and other buildings. Bicycles, perambulators, and mangles were among the items for which provision in these times was a necessity, and the space indoors was so limited, with every available corner used, that no amount of contrivance could give him what he needed. Outbuildings should certainly be provided.

VISIT TO THE ENDERBY QUARRIES.

Under brilliant weather conditions, the members of the Eastern and North-Eastern Districts of the institution and their friends visited the well-known granite quarries of the Enderby and Stoney Stanton Granite Company, Limited. Small as was the attendance, it was amply compensated for by the interest of the proceedings, and a thoroughly enjoyable and instructive day was spent. The party consisted of Messrs. N. E. Dixon (Oundle), J. H. Sharp (Rugby), R. Morris (Southwell), A. Harford-Stevens (Blaby), W. H. Blount (Market Harborough), H. Chapman (Blaby), W. G. J. Clark (Wigston Magna), F. Tucker (Hinckley), A. C. Dixon (Leicester), C. E. Barton, junr.; and, as representing the company, H. J. Grace (chairman), Jas. Marshall (secretary), F. J. Lycett, H. Hevitt, M. D. R. Richardson, and W. H. Bolley. Mr. G. Belson Chilvers, honorary secretary of the combined districts, and B. Wyand, secretary of the institution, also were present.

The party were met at Leicester Midland Railway Station and driven straight to the Grand Hotel, where lunch was served, Mr. H. J. Grace presiding. Time being limited, speeches were dispensed with until later, and the party proceeded in conveyances to the Enderby quarry. This is one of the many quarries owned by the company, the full list comprising, in addition, the Narborough, Redhill, Huncote, Earl Shilton, Stoney Stanton, Granitethorpe, Sapcote, and Tyddyn Howell (North Wales) quarries. The company now form one of the largest granite quarrying industries in the United Kingdom, and they have an immense output of kerbing, channel stones, broken stone for macadam, tarred stone, chippings and screenings for concrete, stone for bacteria beds, and rubble for road foundations. They are also the licensed producers for Durax dustless roads, and much interest was evinced by the visitors in the special machine for making Durax setts. The process of splitting large rocks by small charges of powder was shown, and was followed by three "blasts," which dislodged some 2,000 and more tons of stone.

A move was then made for the Huncote quarry, where there was a similar exhibition of blasting and of rock splitting. Photographs of the various blasts, together with one of the visitors, were taken during the journey, but it is to be feared that they shared the fate of much of the amateur work, which does not go beyond the film or plate stage.

On the return journey the Narborough and Redhill quarries were passed, but time did not permit of deviation. Arrived at the hotel, tea awaited the visitors, and on the conclusion of the meal a vote of thanks, proposed by Mr. N. E. Dixon, and supported by Messrs. W. H. Blount and H. Chapman, was unanimously carried for the kindness of the company in entertaining them as they had done that day.

Mr. G. Belson Chilvers apologised for the absence of the president and of many members, who had been detained on meetings and other business. He was really disappointed that there had not been a larger muster, especially having regard to the splendid programme and the very lavish hospitality. He hoped that an opportunity might be afforded them to pay a further visit in a year or two's time, when he would guarantee a really good attendance.

Mr. H. J. Grace, in returning thanks, expressed the pleasure it had given him to welcome the members on behalf of his company. He, too, regretted the small attendance, but extended at the same time a most cordial invitation to come again—not in a year or two's time, but during the present season. He quite appreciated the difficulty of getting a large number together on a Saturday.

A NEW METHOD OF SEWAGE TREATMENT.

By C. H. COOPER, M.INST.C.E.,
Borough Engineer and Surveyor, Wimbledon.

The S.O.S. Company have entered into a contract with the Wimbledon Council to take all the sludge produced free of cost to the council. The process consists of the substitution of fine carbon for lime, both in the precipitation and sludge pressing; the carbon used is obtained by submitting the sludge cake to a process of destructive distillation. The effluent from the settling tanks resulting from this process will not contain an excess of lime, the deposition of which in distributing mains and on the filters will be obviated.

It is hoped that the process will be in full working order about the middle of July.—From the *Journal* of the Royal Sanitary Institute.

Royal Institute of Public Health.—The annual congress of this body will be held in Edinburgh from July 15th-20th inclusive.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to the Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

THE MONTHLY PREMIUM.

The premium for June is awarded to

Mr. H. G. Lewis,
Admiralty House,
Crombie,
Near Dunfermline, Fife.

whose contributions have, in the opinion of the adjudicators, been the best received during the month.

Mr. Ernest Lovett, of Stoke-on-Trent, has selected the following books in respect of the premium for May:—

"Sewerage Systems, their Design and Construction," by Hugh S. Watson (Lockwood).
"Water Engineering," by Chas. Slagg (Lockwood).
"The Precise Calculation of Pipe Drain and Sewer Dimensions," by C. E. Howsden (Longmans).

These have been duly sent to him.

QUESTIONS.

The following questions are invited to the following week answers:—

404. Collapsing Strength of Pipes.—What is the collapsing pressure in lbs. per square inch of a 3-in. cast-iron pipe, 12 ft. long, and of ¼-in. thickness? Pressure on outside of pipe only. (H. V. A.)

405. Disinfection.—Sketch and describe a form of steam disinfector suitable for use in a town of 30,000 inhabitants.

406. Building Construction.—Sketch a mansard roof, showing timbers; also a dormer window in an ordinary roof. (Junior.)

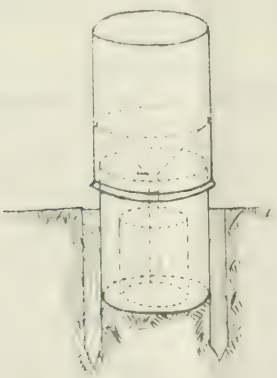
407. Surveying.—Describe a method of setting out circular curves by means of offsets. (M.C.E.)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

403. Rain Gauge.—Describe, with sketches, a reliable form of rain gauge.

A reliable form of rain gauge is that known as Glaisher's, and is much used in the British Isles. It is a cylindrical copper vessel, 18 in. high and 8 in. in diameter, in two parts, one fitting on the other, as shown in sketch. In the upper portion a copper funnel is soldered with its mouth parallel to the top and 8 in. below it. The tube of the funnel reaches nearly to the bottom of a bottle placed under it to receive the rain, and from which the water, if any, is poured daily and measured.



The rain gauge is fixed firmly in the ground by means of a wooden frame, with its top 1 ft. above the ground in order to prevent splashes during heavy rain entering the gauge. There is a danger of some raindrops that should be collected being carried away by eddies of air set up by the impact of the wind against the apparatus, and as a precaution an open broad fence, a little higher than the gauge, is sometimes erected round it at a distance of 2 ft. or 3 ft. This, or some other precaution, is very desirable if the gauge is exposed to strong winds or is at an altitude. (Reader.)

408. Pumping.—How many gallons of water per minute will a 7-in. double-acting pump deliver? Stroke 30-in., revolutions 27. Give formula and say how much should be allowed for slip. (A. B.)

Let r = radius of barrel of pump in inches
l = length of stroke " "
n = number of revolutions per minute

Vol. of water delivered per min. by each barrel
$= \pi r^2 \times l \times n$ inches
$= \frac{\pi r^2 l n}{1728}$ c. feet
$= \frac{\pi r^2 l n \times 6\frac{1}{4}}{1728}$ gallons

(Substituting the figures in this example)

$$= \frac{22}{7} \cdot \frac{49}{4} \cdot \frac{30 \cdot 27 \cdot 6\frac{1}{4}}{1728} = 112{\cdot}79 \text{ gallons}$$

Since the pump is double acting, the total vol. delivered per minute is equal to $112{\cdot}79 \times 2 = 225{\cdot}58$ gallons.

It is usual in a pump of this size to allow about 5% off for slip

∴ total vol. delivered per min. = (225·58—11·27)
= 214·31 gallons.

(J. G. W., *Downpatrick.*)

The following is the formula for the delivery of plunger-pumps:—

$$G = D^2 \times 0{\cdot}034 \times L \times N$$

G = gallons pumped per minute
D = diameter of cylinder in inches
L = length of stroke in feet
N = number of strokes per minute.

In the above case the delivery is—

$G = 7^2 \times 0{\cdot}034 \times 2{\cdot}5 \times 54 = 224{\cdot}9$ gallons per minute.

For plunger pumps a slip of 5 per cent is usually allowed; therefore the correct delivery will be—

$224{\cdot}9 \times 0{\cdot}95 = 213{\cdot}655$ gallons per minute.

—(H. V. A., *Clapton.*)

Tar-macadam Plant for Somerset.—The county surveyor of Somerset, Mr. E. J. Stead, reported on Tuesday that a length of about 200 yds. of the Bristol and Clevedon road has been laid with tarred limestone macadam, the material being supplied by a local firm. The result was not altogether satisfactory, as the class of stone used is not good, and the methods of manufacture are not sound. As the Road Board were providing four-fifths of the expenditure on this work, regarding it as more or less experimental, it was most important that the utmost endeavour should be used to obtain satisfactory results. There were grave difficulties in ensuring that only the material specified is supplied by manufacturers, and the council agreed that the only satisfactory procedure was to obtain suitable plant and make the tar-macadam by direct labour. Besides ensuring that only the most suitable materials and methods were used, it would be more economical to adopt this course. The sum allowed for this work will permit an area of about 40,000 super. yds. to be surfaced, and in order that the work shall be done in the most approved manner the council adopted the proposition of the county surveyor to purchase a portable plant, comprising stone crusher, dryers, heaters and mixers. The approximate cost is £1,000.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Blackpool T.C. (June 18th. Major J. Stewart). £4,846 for works of private street improvement. The borough surveyor, Mr. J. S. Brodie, explained that the work was to be done by contract, but that no tenders had as yet been accepted. The footpaths were rather wider than usual—9 ft. But it was necessary to have them so in Blackpool. Mr. Brodie gave particulars of the work. He said that if anything the price of materials was going down. The inspector: I am glad to hear something is going down, for there's very little doing so. In the course of the proceedings the inspector thanked the borough surveyor for the careful way in which he had prepared the plans. It was not often, he said, that they got them quite so complete.

Bradford T.C. (June 18th. Mr. W. O. E. Meade-King). £515 for the purchase of land for the Bierley-lane recreation ground, and sums amounting to £6,780 for the provision of a branch library and cottage baths in Tennyson-place.—The city surveyor, Mr. W. H. S. Dawson, stated that the ground it was proposed to acquire at Bierley-lane had an area of about 3 acres. The town clerk said that the baths and library scheme in Tennyson-place was to replace the Otley-road library, where the premises were very inconvenient.

Cork T.C. (June 18th. Mr. P. C. Cowan).—£2,250 for the purpose of providing additional machinery at the waterworks.—The city engineer stated that a portion of the plant was very old and obsolete. It had been down for fifty-six years, and it was not working as efficiently as it might, and as compared with modern turbines its power and utility were three times less.

Dudley T.C. (June 23rd. Mr. Edgar Dudley).—£3,280 for the purchase of property for the widening of New-street, Hall-street and Castle-street.—New-street was described as a main thoroughfare whose widening was essential. With respect to the purchase of property in Hall-street, the inspector declared that £70 a square yard for the frontage only was too high a price.

Harrogate T.C. (June 10th. Mr. F. H. Tulloch).—£2,096 for private street improvements in West-street, Tors-street, Roseville-road, Anchor-street, Omega-street, Back Omega-street, and back road of Diamond-place.—The necessary evidence was submitted by the borough surveyor, Mr. C. E. Rivers.

Hendon U.D.C. (June 15th. Mr. F. H. Tulloch).—£5,234 for works of private street improvement in Woodville-road, St. Mary's-road and West Heath-road, Golders Green.—The engineer, Mr. S. S. Grimley, stated that it was proposed to use for the pavements artificial stone with red brick for the verges. This was a little cheaper than laying the whole with artificial stone, and the red brick looked better than the gravel, which often got dirty.

Honley U.D.C. (June 16th. Major J. Stewart).—£2,500 for the erection of council offices and gas offices in Eastgate, also a loan of £800 for the widening of Honley Bridge.—The new council offices are to be erected in Eastgate, on a site adjacent to Honley Bridge, and the building will comprise—on the basement floor, workshop, apparatus room, &c.; ground floor, collector's and clerks' offices; vestibule, gas showroom, gas office, &c.; and first floor, council chamber (31 ft. by 19 ft.), committee-room (18 ft. by 17 ft.), surveyor's office, sanitary inspector's office, gas manager's office, laboratory, &c. The walls will be of local stone, lined with bricks, and ashlar dressings, the basement floor to be of concrete. The building will be lighted by electricity, and heated by hot water on the low-pressure system. The proposed improvement comprises the widening of the bridge from Huddersfield-road to Eastgate. The bridge is 24½ ft. wide, and the total width when completed will be 36 ft., consisting of 30-ft. carriageway and 6-ft. footpath. It is intended to pull down and re-erect the parapet wall in a new position. The new portion of the roadway and causeway will be carried by steel channeling. The existing level of the roadway is to be retained throughout.

Millom U.D.C. (June 25th. Major C. E. Norton). £2,250 for the purpose of purchasing Knott End Farm, adjacent to the council's reservoir at Whicham.—The object of the proposed purchase, it was explained, was to remove any possible source of contamination to the water supply.

Rainford U.D.C. (June 26th. Mr. W. H. Collin). £2,500 for the erection of fourteen workmen's dwellings.—It was stated that land for the houses had been offered for 1s. 2½d. per square yard, which was considered a most reasonable price, and Mr. Baron, St. Helens, the architect who had prepared the plans, said the cottages could be erected at a cost of £150 each.

St. Germans U.D.C. (June 23rd. Mr. P. M. Crosthwaite). £1,500 for works of water supply. The surveyor, Mr. P. B. Govett, explained that the proposed works comprise sinking a well, cutting an adit, constructing a reservoir with a capacity of 44,000 gallons, and piping the water for a distance of 3,767 yds. in 3-in. cast-iron mains. The daily yield of water is estimated at 8,000 gallons, and the scheme was intended to serve a population of about 420, whose consumption per head was put down at 10 gallons per day. The inspector, having regard to the fact that insufficient protection seemed to be afforded by the geological formation of the site, suggested the advisability of fencing the collecting area to prevent risk of pollution from the surface.

Sutton Coldfield T.C. (June 24th. Mr. H. Shelford Bidwell).—£5,500 for the provision of a refuse destructor at the rear of the highways depot in Rilandroad.—The borough surveyor, Mr. W. A. H. Clarry, spoke in favour of the site, and explained that the steam generated in the destructor would be utilised in the adjoining electrical works for day load purposes.

Valley (Anglesey) R.D.C. (June 17th. Mr. Edward Leonard). £236 for the purpose of erecting two working men's cottages on a site given by Sir Harry Verney on a 99 years' lease at an annual ground rent of 1s.—It was stated that the scheme (which was formulated by Mr. St. John Hancock on behalf of the Welsh Housing Association) was in the nature of an experiment. Each cottage would contain a large living room, three bedrooms, a scullery, an emergency room, and a pantry, and there would also be a small garden for cultivation. The area of the site was ½ acre. The council proposed to charge a weekly rent of 2s., excluding rates, evidence being given that the rents of cottages at present varied from 1s. to 1s. 6d a week, but these were practically one-room cottages with no conveniences.

APPLICATIONS FOR LOANS.

Aspatria U.D.C. £1,450, additional cost of sewerage scheme.

Colwyn Bay U.D.C.—£1,000 for gas mains.

Evesham R.D.C.—£3,370 for a housing scheme at Bretforton.

Hayfield R.D.C.—£250 for experimental boring works.

Hendon U.D.C.—£4,030 for road widening.

Lewisham B.C.—£1,545 for wood paving works.

Prestatyn U.D.C.—£2,800 for the extension of the waterworks, and £1,110 for road widening.

Shrewsbury T.C.—£2,200 for cemetery extension.

Smethwick T.C.—£2,620 for the purchase of a site for a secondary school.

Truro T.C.—£10,000 for an electric lighting scheme.

Whittlesey R.D.C.—£2,634 for a housing scheme.

LOANS SANCTIONED.

Barking U.D.C. £2,628 for wood paving works.

Castleford U.D.C. £1,724 for laying granite setts.

East Cowes U.D.C.—£600 for street and sewerage works.

Finchley U.D.C.—£6,820 for a public swimming bath.

Hendon U.D.C.—£17,466 for the erection of the Wessex-gardens school, £2,000 for a public convenience, £754 for the purchase of a site at Hale Grove-gardens for a school, £2,110 for street improvement, and £3,500 for sewerage.

Mansfield T.C. £1,600 for works of sewerage.

Nuneaton T.C.—£7,000 for electricity mains and services, and £820 for the provision of a park.

Stoke T.C.—£7,677 for a town hall.

Sunderland R.D.C.—£2,600 for sewerage works.

Swindon T.C.—£4,650 for engineering laboratories at the technical school.

Upton R.D.C. £1,000 further loan for the Kempsey sewerage scheme.

Wirral R.D.C. £2,200 for making up certain streets.

FORTHCOMING INQUIRIES.

CORRESPONDENCE.

Sir, though I would persuade, I'll not constrain;
Each man's opinion freely is his own
Concerning anything, or anybody.
—MASSINGER: "The Fatal Dowry," Act ii, 2.

ROAD TERMINOLOGY.

To the Editor of THE SURVEYOR.

SIR,—I had no intention of replying to any further letters of your correspondent "Not so Dusty," but in any case I wish to satisfy you that the statements made in my last letter are not devoid of truth as "Not so Dusty" suggests, and if he will place in your hands the sum of £25, to be devoted to any charity you may decide, I am perfectly willing to prove what he asks—viz., "that I have had thirty years' personal experience in refining bitumen for road paving," and that I "have anything else but a very limited knowledge of the manipulation of natural bitumen for road work outside the laboratory." The evidence and proof would be laid before you, and perhaps you would have no objection to making known, through the columns of your paper, whether I have satisfactorily established my case or not. When this has been done I think I may rightly ask for some form of acknowledgment from your correspondent.—Yours, &c.,

ENGINEER.

INDIAN AND EURASIAN STUDENTS IN ENGLAND.

To the Editor of THE SURVEYOR.

SIR,—In reply to "A Duty" in THE SURVEYOR of June 26th (p. 1002), I would like to point out that India is a country is making great and rapid strides in sanitation, and that the Indians, Anglo-Indians and Eurasians who have taken to civil engineering as a profession find it to their advantage to come to England to gain practical experience and pass examinations in civil and sanitary engineering which make them better fitted for their professions. As to the Government of India defraying the expenses incurred by the students coming to England, this is not the case. Certain students with scholarships in colleges which help them pecuniarily, but the vast majority come at their own expense with the object in view of perfecting themselves in their profession. If the same facilities were provided for the students to gain the required experience and get the necessary testamurs in India, there would not be the influx of Indian, Anglo-Indian and Eurasian students in England that there is at the present time.—Yours, &c.,

AN ANGLO-INDIAN
(Student Engineer).

July 1, 1914.

THE UPKEEP OF ROADS.

MOTOR 'BUS OWNERS' CONTRIBUTIONS.

The Local Legislation Committee of the House of Commons on Wednesday had before it the question of motor 'bus owners' contributions towards the upkeep of roads.

Sheffield Corporation sought powers to run motor omnibus services over seven different routes, extending outside the city boundaries into the area of the West Riding County Council and the Derbyshire County Council. These authorities opposed the Bill, and urged that the powers sought should not be granted unless Sheffield were put under an obligation to contribute towards the upkeep of the country roads for extra wear and tear due to the motor 'bus traffic.

The Committee decided to authorise four of the seven routes proposed, on condition that Sheffield contributed towards the upkeep of the roads at the rate of ¾d. for each car-mile run by the motor 'buses, the contribution to be subject to revision every three years. In the event of the Imperial contribution to main roads being increased by one-fourth of the total outlay, Sheffield's contribution is to be reduced by one-half, and in the event of the Government paying half the cost of main roads Sheffield's contribution will cease.

The Chairman said the Committee, in their annual report, would suggest that Parliament should lay down a general principle to apply to the whole country.

Answering a question in the House on Wednesday, the President of the Local Government Board said it was proposed to ask Parliament to appoint a Joint Select Committee to consider the general question of contributions to road expenses by the owners of motor and trolley omnibus services. The question of requiring the owners of heavy motor vehicles to pay a larger contribution than now was receiving the attention of the Treasury. He hoped it might be possible to begin the investigation this Session.

The Salford Highways Committee.—The Salford Highways Committee, whose action with respect to street maintenance in the borough has been condemned by a special committee, have resigned in a body as a protest against the continued refusal of the town council to sanction a higher rate for the purposes of the department.

The New Western Road Scheme.—Considerable opposition will be offered to the new Western road proposal of the Middlesex County Council when it comes before the House of Lords Committee in a few days. The Metropolitan Water Board, the London United Tramways, the Duke of Northumberland, the Metropolitan District Railway Company, the London General Omnibus Company, the Roads Improvement Association, and the Brentford Gas Company, have lodged petitions praying to be heard in Committee against it.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below: Buildings—Birkenhead £12,000, Kidderminster £8,000. Housing and town planning—Cambridge, Doncaster. Roads and materials—Bexhill, Hammersmith £3,550; sewerage and sewage disposal—Burry Port, Woodwell; water, gas and electricity—Haddingtonshire. Particulars of other projected works will be found in "Local Government Board Inquiries," page [illegible].

BUILDINGS.

Bexhill T.C.—The borough surveyor, Mr. T. Ball, has received instructions to prepare a plan and estimate for the provision of a chalet or pavilion for catering purposes in the public park.

Birkenhead T.C.—A scheme has been adopted for extensions to the borough hospital, at an estimated cost of £12,000.

Brighton T.C.—It has been agreed to provide an infants' department at the Coombe-road school at a cost of £6,317. A scheme has also been adopted for a lairage at the abattoir, at an estimated cost of £280.

Essex C.C.—The council have decided to build a secondary school for 200 scholars at Barking.

Kidderminster T.C.—The Baths Committee recommend a scheme for new baths, at an estimated cost of £8,000.

Stoke Newington B.C.—A scheme has been adopted for the extension of the municipal offices, at an estimated cost of £1,550.

Upholland U.D.C.—The council have adopted the estimate of cost, at £1,800, prepared by the surveyor, Mr. A. Hunt, for the erection of new municipal offices.

HOUSING AND TOWN PLANNING.

Alnwick U.D.C.—It has been agreed to build eighteen workmen's houses in South-road.

Barry U.D.C.—A scheme has been passed for building twenty-four workmen's houses at £200 each.

Cambridge T.C.—A resolution has been passed to build 150 houses at rentals under £15 yearly, including rates.

Doncaster T.C.—A scheme has been approved for the erection of 100 workmen's houses on a portion of the Carr House estate.

Glasgow T.C.—It has been agreed to build two balcony tenements of three storeys in height facing Moncur-street, and so planned that the houses may be let separately as forty-eight single apartments, or if desired, as two-apartment dwellings. The following is the estimated cost of the tenements and caretaker's house: Cost of site (1,050 sq. yds.), £1,365; cost of building, £3,500; cost of furnishings, £310; total, £5,175. The estimated annual revenue and expenditure are as follows: Revenue—forty-eight apartments let at an average of 4s. 6d. per week, £561 12s.; expenditure, £553 15s.; leaving a surplus of £7 17s.

Holywell R.D.C.—Subject to certain slight alterations, Lord Mostyn has given his approval of the council's plans for the erection of workmen's dwellings at Mostyn. Owing to the lack of an adequate water supply, it had been decided to eliminate from the plans the provision of baths. The chairman of the Housing Committee, Mr. J. Petrie, explained that this water difficulty prevailed in every district where the council was proposing to erect workmen's dwellings. They all agreed as to the desirability of providing baths in these houses, but it was useless to go to the expense of doing so when there was not a sufficient supply of water.

Northwich U.D.C.—The surveyor, Mr. J. Brooke, has been instructed to prepare specifications and obtain tenders for the erection of thirty-six workmen's dwellings.

PARKS AND OPEN SPACES.

Chester T.C.—Having acquired the grounds of the old Deeside Tennis Club, the Meadows, the council have resolved to lay out two tennis courts and a bowling green for the use of the public.

ROADS AND MATERIALS.

Bexhill T.C. With reference to the proposed coastal road, the borough surveyor, Mr. T. Ball, reported on Monday that he had received from the borough surveyor of Eastbourne, Mr. A. E. Prescott, a letter, in which it was suggested that an estimate of the cost of the whole of the works should be prepared by the surveyor of each local authority through whose area the road would pass. He had therefore prepared a preliminary estimate, and submitted it to the Highways Committee. The estimate was for £64,566, and the committee approved of its being submitted for consideration at the next conference of the authorities interested.

Chelmsford T.C.—The Road Board have sanctioned a grant of £2,139 for resurfacing the main roads during the current financial year, subject to a satisfactory scheme being agreed upon.

Chester T.C.—Application is to be made to the Road Board for a grant of £500 for proposed improvements in Northgate-street.

Haddingtonshire C.C.—The council have authorised capital expenditure of £12,493 in respect of the Eastern District, and £18,237 in respect of the Western District for the purchase of additional plant in connection with an extensive scheme of road improvement which has been resolved upon. Towards the cost the Road Board have sanctioned a grant of £8,123. In terms of the arrangement made, authority has been given to borrow £18,500, free of interest, from the Road Development Commissioners.

Hammersmith B.C.—Wood paving works, estimated to cost £3,550, are to be carried out at Walling-road.

Hornsey T.C.—The chairman of the Highways and Lighting Committee announced at a meeting recently that owing largely to the perseverance of the borough engineer and surveyor, Mr. E. J. Lovegrove, the council had a promise of £3,000 from the Road Board for the roads.

Lambeth B.C.—A report has been submitted by the borough engineer, Mr. H. C. J. Edwards, giving details of the work of cleansing the roadways and the number of men employed, and concluding with the suggestion that eighteen men might be dispensed with. It was recommended that the sweeping gangs be reduced by eighteen men. Councillor Hawes thought that machine sweepers (motors) and mechanical traction ought to be adopted as being more economical and up-to-date. Eventually it was agreed that the borough engineer should ascertain how many men had been discharged owing to the adoption of tar-spraying by other London boroughs, in order to ascertain what economy had been effected.

Llanfrechfa U.D.C.—A number of roads have been scheduled in order to be dealt with under the Private Street Works Act.

Louth R.D.C.—A steam roller with accessories is to be purchased from Messrs. Marshall, Sons & Co., Gainsborough, for £545.

Scarborough T.C.—The borough surveyor, Mr. H. W. Smith, has prepared plans of a proposed new road from Castle-road to St. Mary's-walk, which are being considered by the Streets and Works Sub-committee.

Stoke Newington B.C.—Repairs are to be carried out in Finsbury Park-road, at an estimated cost of £377.

SEWERAGE AND SEWAGE DISPOSAL.

Burry Port U.D.C.—Mr. H. B. Cottrell, of Bristol, has been appointed to report on and superintend the carrying out of a scheme for the drainage and sewerage of the district.

Hendon U.D.C.—Negotiations have been completed for the purchase of land for a scheme of sewage disposal.

Newport (Mon.) T.C. — The Health Committee recommend the acceptance of the tender of Mr. Ewart Evans, at £9,821, for the construction of sewers and outfall works.

Rochford (Essex) R.D.C.—The Local Government Board have expressed approval generally of the pro-

[illegible] will be £[illegible] estimated [illegible] £[illegible].

Wombwell U.D.C. [illegible] Mr. W. Quest has [illegible] preparing plans and estimates for the [illegible] extension of the sewage disposal works.

Wrotham U.D.C. The plans of the proposed new sewerage and sewage disposal works have been approved by the Local Government Board.

WATER, GAS, AND ELECTRICITY.

Bedford R.D.C. It is [illegible] to engage an engineer at a fee of 20 guineas to report upon schemes for a water supply to the parishes of Great Barford, Roxton, Wilden, Ravensden, Clapham, and the Thurleys, parish of Goldington.

Belfast T.C.—The tender of the British Westinghouse Electric and Manufacturing Company, Limited, at £2,000 has been accepted for the supply of a rotary converter for the electricity works.

Brighton T.C.—The nett surplus on the working of the electricity undertaking last year was £2,342, as against £1,197 in the previous year.

Haddingtonshire C.C. Capital expenditure of £8,380 has been sanctioned for work in connection with the North Berwick special water supply district.

Matlock Bath U.D.C.—Mr. G. Key, vice-chairman of the council, has presented to the town a recently discovered source of water supply, which, it is calculated, will save a rate of 2d. in the £. A curious history attaches to the place where the water is to be tapped. A century ago a Manchester man sunk £20,000 in lead mine workings there, and struck a large spring, which flooded him out, and he lost all his capital.

Paignton U.D.C.—The water engineer reports that since scraping was first started this year the delivery of the main has apparently been increased 25 per cent. The council decided to obtain an estimate for a new scraper, and approved the recommendation of the water engineer with regard to the renewal of the old water main.

Southmolton R.D.C.—The medical officer, Dr. Sydenham, in his report, warns the council that the Northmolton water supply should receive attention this year, and that at Witheridge it would also be necessary to do something.

Tanderagee R.D.C.—The Local Government Board having directed the council to provide a proper water supply for the Laurelvale district, the council have engaged the services of Mr. Ross, of Messrs. Perry & Ross, to report on the best means of improving the supply.

Upton R.D.C.—The Local Government Board have sanctioned the scheme for a water supply at Upton, and has also given consent to a loan to the extent of the council's borrowing powers.

Woolwich B.C.—The Board of Trade have sanctioned an arrangement by which the Woolwich municipal electricity undertaking proposes to join two private company concerns in the matter of bulk supply. Such an arrangement between a municipality and private companies has not previously been sanctioned in connection with any Metropolitan electricity undertaking.

MISCELLANEOUS.

Bolton T.C.—The borough surveyor, Mr. E. L. Morgan, has submitted an estimate in connection with the proposed purchase of land for the extension of the cemetery, and the Finance Committee have been authorised to apply to the Local Government Board for sanction to borrow £4,701 for the purpose.

Liverpool T.C.—The corporation have just ordered eight Halley tipping waggons. This is the eighth order received by the Halley Company from the same source in four years.

Middlesex C.C.—The council have intimated to the Thames Conservancy that, in view of the expense involved, estimated at £[illegible],000, and the fact that the navigation of the Thames would be to a large extent improved, they are prepared to approve the scheme of the Conservancy's engineer for the prevention of flooding. The Road Board has agreed to contribute, subject to the consent of the Treasury, one-third of the total estimated cost (£371,071) of some thirty-seven schemes [illegible] main and district roads in the county. Included are the Kingston-road, Teddington, which is to be resurfaced with bituminous mate-

rial at a cost of £2,170; the Kingston and Staines main road, Sunbury, to be resurfaced with Tarmac at a cost of £2,767; and the Staines main road, to be laid with asphalt pavement at a cost of £36,646. Subject to the Hampton Urban District Council giving up the necessary land, it has been agreed that the county engineer (Mr. H. T. Wakelam) should be instructed to widen the Upper Sunbury-road opposite the district council offices at an estimated cost of £200. The tender of Messrs. Stephen Kavanagh & Co., of Surbiton-hill, has been accepted at £8,650, for the rebuilding of Cranford county bridge. As a preliminary to the preparation of a report as to the possibility of widening Richmond Bridge and improving the Surrey side approach thereto, while retaining the artistic beauty of the bridge, it has been agreed, on the recommendation of the surveyors to the two county councils concerned, to spend about £700 for putting down test pits for the purpose of making a close examination of the foundations of the bridge, provided the Surrey County Council agree to pay half the cost.

PERSONAL.

Mr. Arthur Oddy, borough surveyor of Yeovil, has received an increase of salary of £25 a year.

Mr. W. F. Gardiner, assistant in the borough surveyor's department, Morecambe, has been appointed assistant to Mr. J. E. Aldersley, surveyor to the Earby Urban District Council.

Mr. H. W. Carter, surveyor and inspector of Matlock Bath, has been appointed surveyor and sanitary inspector to the Bollington Urban District Council, at a salary of £140 per annum.

Mr. H. T. Wakelam, M.INST.C.E., county engineer of Middlesex, on Thursday of last week had his salary increased to £1,600 a year (to advance to £1,800), increase to date from April 1, 1914.

Mr. J. A. Brodie, city engineer of Liverpool, will read a paper at the annual meeting of the Tramways and Light Railways Association, which is to be held at Newcastle-on-Tyne on July 16th and 17th.

Mr. A. H. Clayton, surveyor to the Deeside District Committee of the County of Aberdeen, has received an increase of salary of £50 per annum. Since Mr. Clayton's appointment six years ago, his committee have shown their appreciation of his services in many ways, more notably in the purchase of a residence for him, and the purchase of a motor car to enable him the better to supervise the work of his large district.

Mr. Albert D. Jenkins is recommended by a subcommittee of the Liverpool Corporation for the office of city land steward and surveyor, vacant by the retirement of Mr. Shelmerdine, at a commencing salary of £1,200 a year. Mr. Jenkins is forty-two years of age, and is a Fellow of the Surveyors' Institution, a member of the Auctioneers' and Estate Agents' Institution, and of the Royal Sanitary Institute. Formerly in private practice in Swansea, he has had considerable experience of estate development, building and management, and has charge of large transactions in all classes of property. For the past three years he has successfully managed the Swansea Corporation buildings and landed estate, the latter comprising over 1,000 acres, with a rental of about £18,000 a year, besides 645 acres belonging to the Education Committee. He has advised the corporation in respect to a development scheme for the Town Hill estate, eventually to cost over £300,000 plus a tramway scheme to cost about £50,000, and various housing and drainage projects.

The assumption in last week's issue, based upon the report in a local paper, that the silver challenge cup for rowing which was competed for recently was the gift of the present surveyor to the Wood Green Urban Council, Mr. C. H. Croxford, and the clerk, turns out to be incorrect, as the trophy was given jointly by a former surveyor and clerk.

Obituary.—We regret to announce the death, which occurred on Sunday last, of Mr. J. Campbell Smith, formerly borough surveyor of Bury St. Edmunds. Deceased was fifty-eight years of age. The funeral, which took place on Wednesday, was attended by Mr. A. Mitchell, the deputy mayor of Bury St. Edmunds, and Mr. W. D. Harding, the borough surveyor, among others.

FOR OTHER ADVERTISEMENTS

See End of Paper.

COUNTY OF SOUTHAMPTON.

RECONSTRUCTION OF STONING BRIDGE, RINGWOOD.

Persons desirous of tendering for the partial reconstruction of Stoning Bridge, situated at Ringwood, may obtain copies of the Plan, Specification and General Conditions, and all other necessary information, on application at the office of Mr. W. J. Taylor, County Surveyor, The Castle, Winchester, on and after Wednesday, July 8th, 1914, between the hours of 9 a.m. and 4.30 p.m. (Saturdays 9 a.m. and 12.30 p.m.).

A deposit of two guineas will be required for a copy of the Plan and Specification and General Conditions. The deposit will be refunded on receipt of a *bonâ-fide* Tender and the return of the documents. Deposits must be made by cheque payable to the Hampshire County Council, and crossed "Capital and Counties Bank, Ltd., Winchester," or the particulars cannot be sent.

Tenders must be on forms supplied by the County Surveyor, endorsed "Stoning Bridge, Ringwood," and be delivered to me on or before 10 a.m. on Monday, the 20th July, 1914.

The County Council do not bind themselves to accept the lowest or any Tender.

H. BARBER.
Clerk of the County Council.

The Castle,
Winchester.
June 30, 1914. (1,754)

COUNTY OF SOUTHAMPTON.

RECONSTRUCTION AND STRENGTHENING OF ST. CROSS BRIDGES, NEAR WINCHESTER.

Persons desirous of tendering for the Reconstruction and Strengthening of Four Small Bridges, situated on the Winchester and Botley Main Road, just south of St. Cross, near Winchester, may obtain copies of the Plan and Specification, General Conditions, and all other necessary information on application at the office of Mr. W. J. Taylor, County Surveyor, The Castle, Winchester, between the hours of 9 a.m. and 4.30 p.m. (Saturdays, 9 a.m. and 12.30 p.m.).

A deposit of one guinea will be required for a copy of the Plan and Specification, General Conditions, which will be refunded on receipt of a *bonâ-fide* tender and the return of the documents.

Deposits must be made by cheque, payable to the "Hampshire County Council," and crossed "Capital and Counties Bank, Limited, Winchester," or the particulars cannot be sent.

Tenders must be on forms supplied by the County Surveyor, endorsed "St. Cross Bridges," and be delivered to me on or before 10 a.m. on Monday, the 20th July, 1914.

The County Council do not bind themselves to accept the lowest or any Tender.

H. BARBER,
Clerk of the County Council.

The Castle, Winchester.
June 29, 1914. (1,753)

URBAN DISTRICT OF DENTON.

The Urban District Council of Denton invite Tenders for the Construction of about One Thousand Yards of Twelve-inch Stoneware Pipe Sewer, partly in Tunnel, and other works in connection therewith in Thornley-lane and Gorton-road, Denton.

Drawings may be seen at the office of the Clerk of Works in Thornley-lane, Denton.

Specifications and Forms of Tender may be obtained at the office of the Surveyor to the Council, Town Hall, Denton, near Manchester, between 9.30 o'clock and 11.30 o'clock in the morning of any weekday on payment of One Guinea, which will be refunded upon the receipt by the Council of a *bonâ-fide* Tender in each case.

Tenders to be enclosed in a sealed envelope, and endorsed "Tender for Thornley-lane Sewer," and addressed to the Chairman of the Sewage Committee, Town Hall, Denton, near Manchester, and sent in so as to be delivered not later than Wednesday, the 22nd July, 1914.

(By order)
WM. RICHARDS,
Clerk to the Council.

Town Hall,
Denton.
July 1, 1914. (1,756)

TOTTENHAM URBAN DISTRICT COUNCIL.

TO CONTRACTORS.

The Council invite Tenders for Making Up South-grove (Sec. 1, part of).

The plans can be seen, and Forms of Tender and other particulars can be obtained, on application to Mr. W. H. Prescott, M.INST.C.E., Town Hall, Tottenham.

The sum of £5 will be charged for the Quantities in respect of the Road, which sum will be forfeited by the person whose Tender is accepted if the Contract be not executed within seven days from the date he is informed it is ready for signature, otherwise it will be repaid.

Provided that *bonâ-fide* Tenders are received, accompanied by the Conditions, Specification, and Quantities, the deposit will be returned to the unsuccessful parties and their Quantities returned.

The Contractor will be required to pay all workmen on the Council's work the recognised Trade Union rate of wages. A schedule of such wages will be inserted in the Contract, and a copy of the schedule must be exhibited on the pay office at the works.

Sealed Tenders, on the Form supplied, endorsed "Tender for Making Up South-grove (Sec. 1, part of)," to be delivered to me by twelve o'clock noon on Tuesday, 14th July, 1914.

No other Form of Tender will be received.

Security will be required for the due performance of the Contract.

The Council will not be bound to accept the lowest or any Tender, and reserve the right to accept a part only of any Tender received.

(By order)
E. CROWNE,
Clerk of the Council.

Tottenham.
June 30, 1914. (1,760)

BAKEWELL RURAL DISTRICT COUNCIL.

NORTH AND SOUTH DISTRICTS.
TO STEAM ROLLER PROPRIETORS.

Tenders are invited for the Hiring of Two Steam Rollers, with Scarifiers, for approximately six months each.

Particulars can be obtained from Mr. M. Mann, Surveyor, North District, Foolow, near Sheffield, or the undersigned.

Tenders, endorsed "Tender for Steam Rolling," to be addressed and delivered to the undersigned on or before Friday, 17th July, 1914.

The lowest or any Tender will not necessarily be accepted.

T. W. MAWER,
Surveyor (South District).

Surveyor's Department,
Youlgrave,
Bakewell.
July 1, 1914. (1,755)

BOROUGH OF BLANDFORD.

TAR-SPRAYING.

The Corporation of the above Borough are prepared to receive Tenders for Tar-spraying 20,000 sq. yds., more or less, of their Road Surfaces.

Specification and particulars can be obtained from the Borough Surveyor, Mr. P. C. Woodhall.

Tenders, endorsed "Tender for Tar-spraying," to be delivered to the Chairman of the Highways Committee, Mr. Alderman Ball, West-street, Blandford, on or before 5 o'clock p.m., Monday, July 13, 1914.

The lowest or any Tender not necessarily accepted.

C. W. SYMES,
(1,752) Town Clerk.

SURVEYING ASSISTANT. — Wanted in a Borough Surveyor's Office in the Manchester District, a Surveying Assistant well experienced in Private Street Work, quick and accurate, and a good draughtsman. Salary, £2 2s. per week. Applications, stating age, particulars of training and experience, and accompanied by copies of not more than three recent testimonials, to be delivered to Box 1,439, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C., on or before Friday, the 10th inst. (1,757)

ASSISTANT (22), Stud.Inst.C.E., A.M.I.C.E. Exam. (parts), seeks position. Moderate salary. 4 years' office and clerk of works' experience under consulting engineer, chiefly on sewerage, sewage disposal and water works. Box 1,440, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,759)

Institution of Water Engineers.

SUMMER GENERAL MEETING AT STOCKPORT.

(Conclusion)

The business at the second summer meeting of the Institution of Water Engineers at Stockport, presided over by Mr. F. Mallinson, included the consideration of the following paper:

CONTINUOUS AERATION AND FILTRATION OF THE WATER OF PUBLIC SWIMMING BATHS.

By E. Hulme Lewis, M. Inst. C.E.

The author was associated, almost from the outset, with three others appointed by the Baths Committee and the Waterworks Committee of the Manchester Corporation to investigate and to determine the best means for extracting the colouring matter from the town water supply in order to make it more suitable for use in the public swimming baths, and as the investigations ultimately led to the adoption of continuous aëration and filtration in the city, he proposes to give an account of the evolution of the process.

The water used for the public swimming baths in Manchester is obtained from the town supply, the greater part of which is collected from moorland watersheds, and is invariably more or less discoloured, the degree of discoloration being subject to considerable variation through changes in the weather, and the varying condition of the vegetation and soils with which it comes in contact in its passage into the impounding reservoirs. The discoloration is generally very pronounced when heavy rainfall follows upon a long spell of dry and sunny weather, and the water usually remains more or less discoloured for a considerable time after the rain ceases. While the colour may not, and usually does not, affect either the potability of the water or its fitness for industrial purposes, it is very objectionable in water used in public swimming baths. . . . The system of continuous aëration and filtration was at first viewed with considerable misgivings by medical officers of health and others interested in the matter, but it has now proved capable of maintaining water, even when continually fouled by body contact, &c., free from all offensive smell, and in a bright, clear and otherwise satisfactory condition for an indefinite period. . . .

In the early part of the year 1901 the Baths Committee empowered Alderman Rothwell to confer with the Waterworks Committee with respect to the treatment of the town water supply as a whole in order to make it more suitable for use in swimming baths. It must, however, be explained that there was nothing exceptional in the condition of the town water at this period to warrant special investigation, or to make its treatment more necessary than previously. The Waterworks Committee, on being approached on the subject, and influenced no doubt by the economy which would be effected by any successful method of continuous filtration, readily assented to co-operate with the Baths Committee in carrying out certain experiments for the purpose of ascertaining the extent to which the water could be made more transparent by mechanical filtration.

The conduct of the investigations and experiments was left in the hands of Alderman Rothwell, while Mr. Haynes (water engineer), was appointed to co-operate on behalf of the Waterworks Committee, and Mr. Derbyshire (General Superintendent of Baths) on behalf of the Baths Committee. Several firms of filter manufacturers were invited to submit proposals, but after inspecting various processes in operation, and ascertaining that the object in view could not be satisfactorily attained with any of the plants inspected, it was decided to design and construct an experimental filter on lines suggested by Alderman Rothwell. The design of the filter (Plate 1), was prepared by Mr. Haynes. It consisted of a rectangular cast-iron tank having a false bottom A to form a compartment B for the reception of the filtered water. The water from the town main was discharged into the upper compartment C of the tank through a ball-valve D, and passed from this compartment through the filtering medium E into the lower compartment B, and thence into a heater on its way to the bath. The filtering medium was wrapped round wire-woven cylinders F, which were arranged vertically over suitable openings G in the false bottom of the tank.

The filter was fixed in connection with one of the baths at the Newton Heath establishment, and a series of interesting and instructive experiments followed, the results of each change, both in the filtering medium and in the rate of filtration being carefully recorded. Various kinds of filtering materials were tried, including coarse turkish towelling, bath-mats, felts of varying thicknesses and densities, filter-paper, and finally a specially prepared felt cloth, the last-named material proving the most suitable. While a marked improvement in the condition of the water was secured, the discoloration was not completely removed. . . .

It was evident, however, that filtration alone would not be sufficient to restore the water even to its original state of clearness and purity, on account of its having to be maintained at a temperature of about 78 deg. Fahr., and that to maintain its fresh and bright appearance it would require to be thoroughly aërated and reoxygenated. It was accordingly resolved to put down an experimental plant in connection with one of the baths at Newton Heath by which this could be put to the test. On Plate 2 is shown the general arrangement of this plant, designed to circulate the bath-water in such a manner as to subject it to a continuous process of aëration and filtration. Means were provided for regulating the rate of circulation, from a minimum rate that would circulate the contents of the bath once in twenty-four hours, to a maximum rate that would circulate this quantity in six hours. The filter used for the earlier experiments was again utilised, and the aërator was placed immediately over the filter tank. The water was raised from the deep end of the bath to the horizontal pipe A above the aërator by a vertical steam-driven reciprocating pump, the exhaust steam from the pump being utilised for reheating the water in its way back to the bath. Pipe A was perforated from end to end over the upper third of its circumference, as shown in Fig. 2a (Plate 2). The water, as it issued through these perforations, broke into a spray, and on coming into contact with the walls of the open ridge B, rebounded, and was caught as it fell to the upper perforated tray C, in the air currents induced by the water as it issued from pipe A. Further aëration and oxygenisation occurred as the water fell from trays C into the filter D, in which the suspended matter was arrested. The trays were finely perforated in order to thoroughly split up the water. The water was conducted from the filter to a reheater E, and thence to the shallow end of the bath.

The results were highly satisfactory, the water in the bath, which was in regular use, steadily improving in condition and appearance from day to day until it became sufficiently clear to distinctly see a three-penny-bit at the bottom of the deep end of the bath. The process of aëration and filtration was continued, at varying rates, regularly for several months, during which time the normal number of bathers used the bath. The water was examined after being in use for about three months, and was declared to be in even a better condition for bathing purposes than when it was first put into the bath. It is safe to assert that no one expected such good results from such a simple process. It not only gave excellent and equal conditions to all bathers at all times, but showed that substantial economies could be effected in the cost of running public bathing establishments.

When the author was engaged in the preparation of plans for the experimental plant above described it came to his knowledge that Mr. O. M. Row—the first to suggest the idea of aëration—had been actively at work for some time previously in developing a scheme having for its object the purification of the water of swimming baths, and was at that moment in negotiation with the Bury Corporation with reference to the installation of his system at their public swimming bath. The section shown on Plate 3 is an illustration of the first complete and permanent installation for the continuous aëration and filtration of bath water. The system was an unqualified success from the beginning, and quickly established itself in public favour; there are at present over 100 installations in successful operation.

The system of purifying bath water by continuous aëration and filtration provides vastly more pleasant

and hygienic conditions than those which obtain when the same water is used for many days unchanged and unpurified. It also prevents the depressing atmospheric effect that invariably prevails where the system is not in operation.

Chemical and bacteriological analyses of samples of water taken from baths after months of use have proved that the water suffers little or no deterioration by means of wide shallow channels constructed entirely of wood set perfectly level transversely, and with sufficient fall longitudinally to allow the water to run over them in an even, thin sheet. Each channel was 4 ft. in width and 3 in. in depth, and had a total length of 42 ft. divided into four sections of equal length, with a 6-in. drop at the end of each section. A number of transverse grooves of U shape (shown in Fig. 4A, Plate 4) were cut in the bottom of the channels in order to break up the water as it passed over them. This method gave fairly good results as regards aëration, but proved less effective as a re-oxygeniser than the experimental plant at the Newton Heath establishment, already described. This, therefore, was added later, in an improved form, to the purifying plant at the Victoria Baths. The same type of aërator, but differing in some of the details, has been adopted in connection with all the purifying plants subsequently installed in Manchester, and also in connection with similar plants fixed elsewhere, with few exceptions.

Fig. 5 shows the main features of this aërator. The ends, which form the frame, are of steel or cast iron made in the shape of a triangle. The sides are formed of louvres, suitably pitched and usually made of glass. They are carried on rods capable of being rocked by hand for the purpose of adjusting the width of the openings. These openings form the passages for the

by prolonged use provided (1) that the purifying plant is correctly proportioned, (2) that the aëration and filtration are continuously maintained, and (3) that the rate of circulation is correctly adjusted to suit the conditions. . . .

The first two complete and permanent plants for the Manchester Corporation were designed by the author, and were installed at the Victoria Baths and the Moss Side Baths respectively. On Plate 4 is shown the general arrangement of the installation at Victoria Baths, where there are three swimming baths, each provided with a separate purifying plant. The plants differ from the experimental plant at Newton Heath only in capacity, and in the design of the aërators and the filters. The aëration was at first accomplished escape of vapour which carries away any offensive smell liberated from the water, and for the admission and emission of fresh air. The water from the circulating pump is discharged through a perforated pipe placed over and extending the full length of the aërator. The water falls from the pipe into the top tray, and thence from tray to tray, in the form of a cascade, to the receiving tank at the bottom. The trays, which are usually made of sheet copper or zinc and finely perforated, gradually increase in area from the highest to the lowest in order to prevent waste of water by splashing over the sides and ends. Suitable shields are added if the aërator is placed in a very exposed position, to prevent the spraying water being blown about by the wind.

to fit snugly into tapered holes in the false bottom of the filter tank. The rubber rings on the tapered ends of the cylinders, which were stretched into position, formed a simple and durable joint, and admitted of the easy removal and replacement of the cylinders. The filtering medium consisted of a specially made felt cloth about $\frac{3}{16}$ in. in thickness, and of very close texture. It was made into sleeves

to fit tightly on the cylinder. This material gave excellent results, but the amount of manual labour involved in cleaning and clearing the choke set up a condition that had to be frequently performed was a serious disadvantage, and after some further experiments it was decided to adopt gravel or quartz filters

Fig. 6 is an illustration of the main features of the filter as made by Victoria Baths. It consists of a closed cylindrical steel casing A, having a perforated false bottom B, consisting of a brass wire mesh sandwiched between two perforated cast-iron plates. The filtering material is fine pearl gravel, which is placed

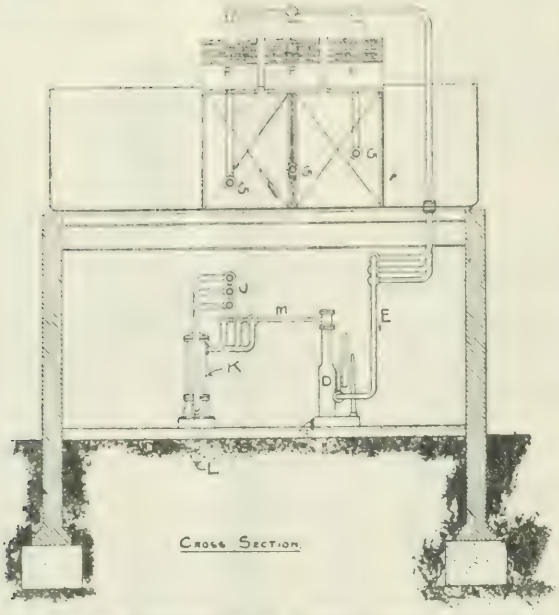
on the ground that they could be cleaned without removing any of the parts, and would work efficiently for reasonably long periods with occasional flushing in situ, and therefore would require less attention, would cost less in upkeep, and be generally more suitable.

upon the false bottom. The water to be filtered enters by the valve D, percolates through the gravel bed, passes through the perforations in the false bottom and discharges, clarified, through the valve E. To clean the filtering material the inlet valve D is closed, the waste outlet F, the air cock G, the stop valve H,



AERATING AND FILTERING PLANT, VICTORIA BATHS, MANCHESTER.

(Plate 4.)

It is claimed for the system of continuous aeration that adopted that it provides greatly improved and uniform conditions in the baths without adding to the cost of [illegible], that is capable of effecting a considerable saving in the quantity of water used. In some places, probably on sentimental reasons, the public object to the use of [illegible] water, but in this case [illegible] and the public have expressed no objection whatever. The author [illegible] the practicability of the system, the first requirement of the water provided the purifying plant is large enough, and that it is given sufficient attention to ensure its efficient working. If the agencies that contribute to the pollution of the water can be successfully [illegible] for a few weeks, why not indefinitely?

It may be urged, and rightly so, that economy, where the public health is concerned, is a matter of secondary consideration, and the author has no desire to dwell overmuch on the economic advantages of the system; but for the benefit of those who are utilitarians first and last, it may be stated that the system is capable of effecting economies in addition to the saving of water. The labour involved in emptying, cleaning and refilling swimming baths forms a considerable proportion of the running charges where a purifying plant is not in operation. The author is informed on reliable authority that the work costs about 25s. per week per bath if changed twice weekly, or, say, £65 per annum for baths open all the year round.

The cost of a complete purifying installation varies between £700 and £1,000, according to size and circumstances; the average may be taken at £800. In the case of new baths, if a purifying plant is installed there is a saving in the initial cost of the steam-raising plant

[illegible] through a system of perforated pipes M, the perforations being uniformly distributed under the entire surface of the false bottom of the filter. The air rising through the filtering material agitates it, and the filtered water, of which a suitable quantity is held in reserve in flush tanks provided for the purpose, flows back through the valve E. By this action the impurities are separated and washed away through the waste outlet F. The air escapes through the cock G, and the steam is, of course, condensed. About three minutes is usually long enough for the injector to be kept in operation; but it is necessary to allow the filtered water to flow backwards through the filter for about two minutes longer in order to ensure the thorough cleaning of the filtering material and the entire removal of air. Experience shows that frequent cleaning, necessitating only short flushing, is better than allowing the filter to run until the material is nearly clogged up.

The other purifying plants installed in Manchester, and in most of those installed elsewhere, are fitted with the filter shown on Fig 6A (Plate 5). It differs from the one last described in that the false-bottom plates and wire mesh are dispened with, and the perforated pipes, through which the filtered water passes to the outlet leading to the bath, and by which the mixture of steam and air for cleaning purposes is admitted, are embedded in a layer of granite chippings over which a bed of gravel about 18 in. in thickness is arranged, and finally on the top a layer of fine sand about 6 in. in thickness. The perforated pipes are of copper, and are carried on wooden supports in order to avoid any risk of electrolytic action being set up in the filter. The shell is made either of steel or cast-iron, and is either circular or rectangular in shape. This filter has proved the best of the types tried in Manchester.

The section on Plate 6 represents the general arrangement of the installation at Moss Side baths, all the main parts of which are similar to the corresponding parts of the Victoria Baths installation, with the exception of the aërator, which consists of a series of open wooden trays or channels superimposed and arranged in such a manner that the water runs in a thin sheet over the trays in a zig-zag fashion, and finally runs from the lowest tray along a channel into an open filter. The filter is the same as that described for Victoria Baths, with the exception that it has an open top instead of being closed.

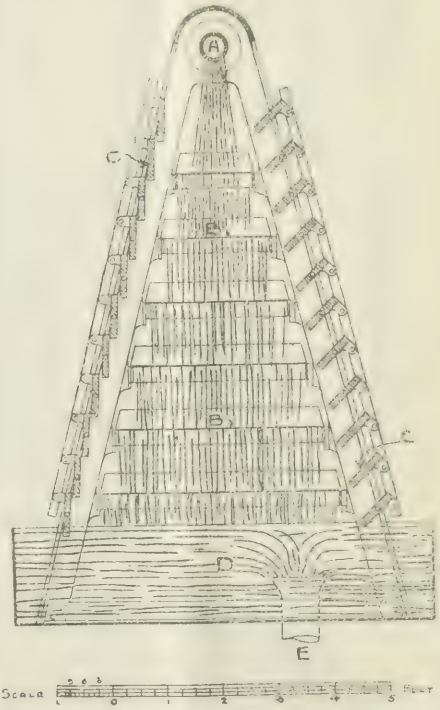


FIG. 5.—MANCHESTER CORPORATION VICTORIA BATHS: DETAIL OF AËRATOR.

of at least £200, as the plant need not be nearly so large. The net amount of extra capital involved by the addition of a purifying plant is therefore about £600. Allowing 7½ per cent per annum for interest, depreciation and maintenance, which experience has shown to be ample, the annual charge in respect of

the plant is about £45, or £20 less than the cost of labour where the plant is not in operation.

The reason a much larger steam-raising plant is necessary for dealing with baths that have to be entirely emptied and refilled two or three times a week is that the temperature of the whole body of water put into the bath has to be raised from about 50 deg. Fahr. to about 78 deg. Fahr. in a comparatively short time. On the other hand with the purifying system in operation, the demand for steam is represented by the amount required to make up for radiation losses, which is found from experience to be that necessary to raise the temperature of the volume of water in circulation through about 8 deg. Fahr.

Taking as an example the case of a swimming bath open to the public for fifteen hours daily, viz., from 6 a.m. to 9 p.m., this leaves nine hours in which the bath has to be emptied, cleaned and refilled with fresh water, an operation occupying not less than three hours; therefore the time available for heating the fresh water put into the bath is about six hours, during which time the temperature of the water has to be raised about 28 deg. Fahr. Supposing the bath were fitted with a purifying plant, and the entire contents were circulated once every six hours, the temperature of the whole of the water contained in the bath would have to be raised through about 8 deg. Fahr. in that time; therefore the ratio of the capacity of the steam-raising plant in the former case to that required in the latter case would be as 28 is to 8, or as 3·5 is to 1. It is here assumed that the exhaust steam from the circulating pump is utilised for reheating the water on its way back to the bath, which is usually about 40 per cent of the total quantity of steam necessary to raise the temperature to the required extent.

DISCUSSION OF MR. HOLME LEWIS' PAPER.

The President (Mr. T. Molyneux) said he was sure they had all been pleased to hear Mr. Lewis, who was one of those modest men who hid his light under a bushel. The paper was a most interesting and a most practical one, and one which would prove very useful to anyone proposing to put in a bath. They had a similar bath in Stockport, and he could bear out Mr. Lewis' figures as to the cost of the installation. The author had said that the average cost might be taken at £800. Their bath at Stockport held 75,000 gallons, and the installation for emptying and refilling that had cost just £800. They charged the bath at the rate of 6d. per 1,000 gallons, and since the installation had been in use the saving in the cost of water had averaged about £60 per annum. The bath superintendent told him that it had made no difference whatever to cleaning out the bath, except that they carried 10 lb. more steam on the boiler. That was exceedingly satisfactory. The bath had been filled once this year, and it had not yet been emptied. He had much pleasure in proposing a vote of thanks to Mr. Holme Lewis for his paper. They ought to be exceedingly grateful to Mr. Lewis for having written such an exhaustive and interesting paper, and for having found time to read it to the institution.

Mr. H. Ashton Hill (Birmingham) seconded the resolution. He said the paper was a very practical one, and many of them would doubtless find it of great use in the future.

Mr. J. Derbyshire (Manchester) said he was very pleased that Mr. Holme Lewis had written the paper, as he believed that the more the arguments which he had used were considered, and the more they were examined, the more converts there would be to his way of dealing with water in swimming baths. It was his (the speaker's) good fortune to be in at the birth of these trials, and to-day they in Manchester stood as the only municipality in the world where every one of their swimming baths was fitted with this installation. When the first and last word had been said on the subject, there were only two systems known—one was to empty their bath at their whim and fancy when they considered it to be dirty; and from opening to closing time they had a continuous stream of bathers. The result was to pollute the water so that the only time that the bath was in the condition they had a right to expect was in the early stages of the first filling, and no attempt had ever been made until this system was introduced, of giving equality of conditions. Those who could pay higher prices, or who, if his convenience would allow him,

attended the bath in its early stages got the plum, while those who were compelled to attend the bath on emptying night were compelled to bathe in water which a few hours after would be emptied down the drain; and those who were privileged to see that water when the last bather had left it would, he was sure, feel that the system described by Mr. Holme

and his (the speaker's) contention was that if they could combine the daily visit of a thousand people, or more, they could spend a good deal more than they liked. At last the medical authorities of this country [illegible] Mr. Lewis was decidedly correct in [illegible] contention was that the question of cost should at [illegible] that possessed the knowledge that it was possible, [illegible] cleaner and more pleasurable conditions, would be [illegible] and plenty at its disposal. He would [illegible] this case should be chemically as pure as it was. He could only suggest that this relative purity must be kept up by the constant addition and passage into it of fresh water, and must come from the mains. Washing was mentioned in the paper, and he thought it was better to do it frequently than at longer intervals [illegible] would like the author to give them some idea of what [illegible] was used in washing, and com[illegible]

Mr. Hetmar Lewis, in reply, said that, with respect to the question of cost, there were no actual tests made [illegible] the first cost of the swing in fuel, but he was informed that it might be taken at something from 7 to 10 per cent. saving as compared with the system of interchanging water at the baths every two or three days. As to the amount of water consumed in flushing the filters that, of course, would vary

(Plate 6.)

like to give a hearty invitation to any members of the institution whenever they were in Manchester to pay a visit to the baths—they had nothing to hide. That was one of those systems of which they were only too pleased to tell all they knew. He asked them to make as many inquiries as they could, because up to the present they had never failed to convert anybody who had inspected the installation.

Mr. H. C. Head said that Mr. Lewis had given them some very interesting figures regarding the capacity of the steam plant, and he would like, if possible, to have the figures with regard to coal consumption.

Mr. W. T. Burgess (London) said that the process was really a continuous use of the same water over and over again, and it was perfectly evident that a good fraction of the water was used for washing the filter plant, and consequently there was an everlasting passage of fresh water into the system. In the analysis at the end of the paper they were able to get some idea of what the purity of the water was under the system, and it was quite surprising to him. He was surprised to find that the water, after being used according to the use made of the baths; but the suggestion that the filters should be frequently cleaned did not necessarily indicate that a larger amount of water was used than if they were kept in use for longer periods. The shorter the time the filter was in use the less amount of water it required for flushing. If they ran the filter for three or four days, and then cleaned it, it took less water than if they allowed it to run double that time. The water used for flushing was by no means large—it was anything from 1 to 3 per cent of the total. In addition, of course, there was the evaporation which took place, and he was not in a position to say how frequently the contents of a bath which was supposed not to be changed was actually changed, but the tables which he had been able to collect from various authorities would give an idea of the saving in water, and it would be found that it was very substantial. His intention was to put on record an account of a system that had not been very long in existence, and one which most concerned water engineers—that was the supply of suitable water for public baths. Another reason

which prompted him when he was asked by the president to contribute something to their meeting was that he conceived it to be the duty of every member to do what he could in helping by writing papers, more particularly if they could discuss a subject in which the saving of water formed an important part.

VOTES OF THANKS.

Mr. C. CLEMESHA SMITH (Wakefield) said it afforded him great pleasure to ask them to accord a vote of thanks to the mayor and corporation of Stockport for the cordial welcome and the generous hospitality they had extended to the institution. During the existence of that institution they had always been fortunate in receiving a very hearty welcome from the corporation in whatever town they had met, but the warmth of their welcome and the hospitality accorded them at Stockport had never been exceeded.

Mr. WILLIAM WHITAKER (Croydon), in seconding the resolution, said he was sure they could all bear witness to the hospitality which they had received at Stockport. Not only had they had the pleasure of the attendance of the mayor and the chairman of the Water Committee, but they had personally looked after their comfort in many ways.

The vote was carried.

Mr. H. C. HEAD (Winchester), in proposing a vote of thanks to the president for his hospitality and for the excellent arrangements made for the comfort and entertainment of the members, said that perhaps the highest compliment he could pay Mr. Molyneux was to say that everything in connection with the meetings had gone on as if it had happened, and not been arranged.

Mr. F. W. Mc CULLOUGH (Belfast) seconded the vote, which was carried with enthusiasm.

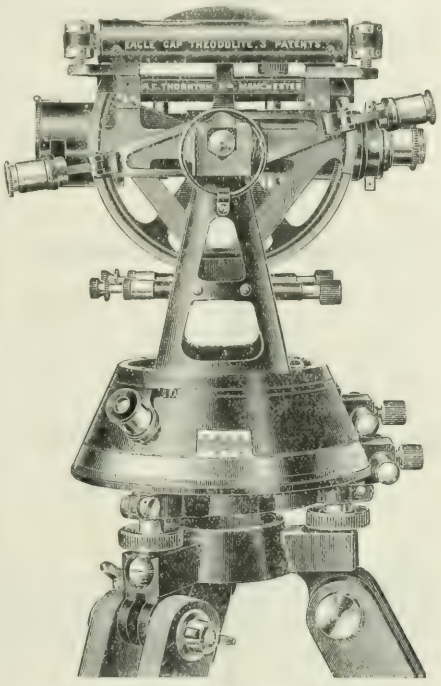
The PRESIDENT, in reply, said he was greatly obliged for the vote of thanks which they had passed, but there was no necessity for it. It had been his duty to do what he had done. He had done it willingly and with great pleasure to himself and to his corporation. He would like to remind them that the institution would be holding its winter meeting in London on December 11th and 12th. Owing to the increasing interest being taken in the institution, it would be necessary to hold a two days' meeting, as the usual Saturday morning would not be sufficient.

THE "EAGLE" THEODOLITE.

Impressed with the need that appeared to exist for an improved type of theodolite, designed more particularly for the mining engineer's work, Messrs. A. G. Thornton, Limited, Paragon Works, Kingsstreet, West Manchester, determined on the production of the instrument required, and the result of their efforts, after three years' continuous experimenting, is to be seen in the "Eagle" patent theodolite, of which some particulars have been submitted to us. This instrument bears the name of Mr. George Eagle, surveyor, who originated the principles on which it is constructed, and who has advised the firm throughout in their endeavours to produce the desired theodolite.

Messrs. Thornton contend that at the present time the most approved type of instrument that is being produced for mining work has all the disadvantages of which the mining engineer complains—a theodolite having the addition of auxiliary telescope, balance weights, and numerous other extra fittings which such additions necessitate. The firm add: "For situations in which sights must be taken downwards within 40 deg. of the vertical, various forms of theodolites with eccentrically mounted auxiliary side or top telescopes have been designed. In almost every one of these situations only one sight of extreme dip has been required from any given station, and to meet such a simple requirement the 'Eagle' theodolite has been designed. In this instrument a gap has been cut in the horizontal plates of the instrument between the hollow centre and the graduated horizontal circle. The tripod of the theodolite may be so set up at a station that in one required horizontal direction from that station (or within 5 deg. of that direction) a sight may be taken at any angle from the vertical without the use of an auxiliary telescope. A one telescope only is sufficient for all purposes, we have felt justified in giving this special consideration in order to obtain the best possible definition. In order to obtain a view through the horizontal plates a gap has been cut from the hollow centre to the circumference, except through the graduated circle and cone centres, which could not be cut away without detroying the instrument. These parts which could not be cut away have been arranged to form parts of two cones with the common apex of the two cones at the centre of the transit axis, where the horizontal and vertical axes intersect, with the result that, viewed from this intersection, these parts appear only as two narrow bars across the gap. As these bars are so near the object glass, they are not visible through the telescope, and do not interfere with or spoil the definition. They cut off a certain amount of light which is only just noticeable, and which has been allowed for by making the object glass of slightly larger diameter than usual."

From the accompanying illustration it will be seen



that the whole instrument is very compact, and it is important to note that the various milled heads of the focussing, pinion, adjusting and tangent screws have been brought out well away from the instrument to ensure plenty of finger room. It has been made as squat as possible without losing any height necessary for accuracy or strength; further, as the main telescope can be used for every sight, the instrument is symmetrical, and it is not necessary to use balance weights.

Talbot Cars.—So far nearly thirty highest awards alone have been won by Talbot cars in speed and reliability trials this season, proving how well the 1914 models are upholding the very best traditions of the "Invincible" Talbot.

Sewerage and Water Supply at Upton-on-Severn.—In his last annual report Mr. M. D. Price, sanitary surveyor to the Upton-on-Severn Rural District Council, states that the whole of the schemes of sewerage and water supply for the village of Powick have been carried out at a cost of £1,443 15s. 3d. The water supply scheme cost £241 2s., the well-sinking £142 5s. 7d., and the sewerage and sewage disposal £1,060 7s. 8d.

A Glossary of Road Terms. By H. Percy Boulnois, M.INST.C.E. St. Bride's Press, Limited, 24 Bride-lane, Fleet-street, E.C. Price 2s. Mr. Boulnois has achieved far more than he may imagine by this production of his pen. He set out to standardise the nomenclature of road terms; in addition he had made a valuable addition to English literature. To the untutored it is like reading a new language; Mr. Boulnois says it isn't anything like "complete." At any rate, it is a valuable *vade mecum* which no one has attempted before. *Portsmouth Times.*

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President Mr. J. S. PICKERING, M.INST.C.E., Borough Surveyor and Water Engineer, Cheltenham.

EASTERN DISTRICT.

An Eastern District meeting will be held at Tilbury [illegible].

CLEETHORPES MEETING.

A meeting of the Institution will be held at Cleethorpes on September 19th.

SCARBOROUGH MEETING.

A meeting of the Institution in the North-Eastern District will take place on Saturday, September 26th, at Scarborough.

EAST MIDLAND DISTRICT.

It is hoped that a District meeting will be held in South Leicestershire in the near future.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

TEMPORARY ASSISTANT SURVEYOR.—July 4th.—Failsworth Urban District Council. £2 per week.—Mr. H. C. Broome, clerk.

SANITARY INSPECTOR.—July 4th.—Lewisham Borough Council. £150—£200.—Mr. E. W. Wright, town clerk, Town Hall, Catford, S.E.

TEMPORARY ASSISTANT.—July 4th.—Corporation of Chard. £78 per annum.—Mr. E. W. Hearn, borough engineer and surveyor.

ASSISTANT SURVEYOR. — July 4th. — Antrim County Council. £120.—Mr. A. Millar, deputy secretary, County Courthouse, Belfast.

ASSISTANT ENGINEER AND SURVEYOR.—July 4th.—Hornsey Town Council. £200—£250 per annum.—Mr. E. J. Lovegrove, borough engineer, Municipal Offices, Highgate, N.

SURVEYOR'S ASSISTANT.—July 4th.—Kidderminster Rural District Council. £1 10s. per week.—Mr. G. J. Shepherd, surveyor, 85 Chester-road, Kidderminster.

BOROUGH SURVEYOR'S ASSISTANT.—July 6th.—Corporation of Loughborough. £120 per annum.—Mr. Henry Perkins, town clerk.

SECOND ASSISTANT.—July 6th.—Devon County Council. £2 2s. per week.—Mr. R. M. Stone, county surveyor (northern division), The Square, Barnstaple.

CLERK OF WORKS.—July 6th.—Devon County Council. £3 per week.—Mr. W. P. Robinson, county surveyor (No. 2 division), 22 Queen-street, Exeter.

CLERK OF WORKS.—July 6th.—Ruislip-Northwood Urban District Council. £3 3s. per week.—Mr. Edmund R. Abbott, clerk, Northwood, Middlesex.

BUILDINGS SURVEYOR.—July 7th.—Henley-on-Thames Rural District Council.—Mr. A. R. Lloyds, clerk.

CLERK OF WORKS.—July 7th.—Minehead Urban District Council.—Mr. L. C. Webber-Incledon, clerk.

ASSISTANT COUNTY SURVEYOR.—July 8th.—Somerset County Council. £200 per annum.—Mr. Edward Stead, county surveyor, Wells.

INSPECTOR OF NUISANCES.—July 11th.—Nantwich Urban District Council. £90 per annum.—Mr. A. E. Whittingham, clerk.

SURVEYOR AND INSPECTOR.—July 11th.—Hay Urban District Council. £100 a year.—Mr. Robert T. Griffiths, clerk, Hay, viâ Hereford.

RESIDENT ENGINEER.—July 14th.—Corporation of Warwick. £3 3s. per week.—Mr. B. Campbell, town clerk.

ASSISTANT SANITARY INSPECTOR.—July 15th.—Highland District Committee of the Perth County Council. £100.—Mr. R. McNicoll, County Buildings, Perth.

CITY SURVEYOR.—August 4th.—Municipal Council of Sydney, New South Wales. £1,000—£1,300 per annum.—Mr. Thomas H. Nesbitt, town clerk, Town Hall, Sydney.

DISTRICT ENGINEER.—Public Works Department of the British Guiana Government. £300—£400 per annum.—Crown Agents for the Colonies, Whitehall-gardens, London.

YOUTH.—Surrey County Council.—Mr. A. Dryland, county surveyor, County Hall, Kingston.

MUNICIPAL COMPETITIONS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter*

MIDDLETON.—July 16th.—Designs for a town hall, the cost of which must not exceed £18,000. Premiums £100, £50, and £25.—Town Clerk.

REIGATE.—July 25th.—Designs for a police and fire station, for the Corporation of Reigate. Premiums 40, 20, and 10 guineas.—Mr. A. Smith, town clerk.

LONDON.—September 7th.—Designs for elementary schools, for the London County Council.—Education Officer, Education Offices, Victoria-embankment, W.C.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

ILFORD.—July 4th.—For laying wood block flooring at a school, for the Education Committee.—Mr. H. Shaw, engineer and surveyor.

ECCLES.—July 4th.—For cleaning and repairing the town hall and other work, for the corporation.—Borough Surveyor.

ESSEX.—July 4th.—For alterations and additions to a school, for the Education Committee.—County Architect, 73 Duke-street, Chelmsford.

HAMPSHIRE.—July 6th.—For the erection of a class-room, for the county council.—Mr. A. L. Roberts, architect, The Castle, Winchester.

LOWESTOFT.—July 6th.—For the erection of new buildings, and alterations to town hall, for the corporation.—Mr. G. H. Hamby, borough surveyor.

WATFORD.—July 6th.—For the erection of a pumping station, including engine-house, basement, machine shop, boiler-house, filter-house, lime store, and softening tank, for the urban district council.—Mr. D. Waterhouse, engineer, Council Offices, High-street, Watford.

MERTHYR.—July 6th.—For school extension, for the Education Committee.—Mr. R. Elias, director of education.

HALIFAX.—July 6th.—For the erection of a public convenience, for the corporation.—Mr. J. Lord, borough engineer.

SWINDON.—July 6th.—For extensions to a school, for the corporation.—Mr. H. J. Hamp, borough surveyor.

WARBLINGTON.—July 6th. For the erection of a cottage, for the urban district council.—Mr. A. J. Martin, 7 Victoria-street, Westminster.

HASTINGS.—July 6th.—For the erection of new buildings at disinfecting station, for the corporation. —Mr. P. H. Palmer, borough engineer.

HALIFAX.—July 6th.—For the extension of the technical college, for the Education Committee.—Mr. J. Lord, borough engineer.

ALNWICK.—July 6th.—For cementing wagonway and erecting thirty-two metal pens, for the urban district council.—Mr. J. Lidster, clerk.

BRADFORD.—July 7th.—For the erection of forty-five workmen's dwellings, for the corporation.—City Architect.

MOUNTAIN ASH.—July 7th.—For constructional works at various schools, for the Education Committee. —Mr. W. H. Williams, architect, Town Hall.

NEWARK.—July 7th.—For the erection of handicraft and domestic centres, for the Education Committee.—Mr. H. W. Lockton, architect, Newark.

TONBRIDGE.—July 7th.—For the erection of twenty-five pairs of cottages, for the rural district council.—Mr. Frank Harris, surveyor.

WINCANTON.—July 7th.—For the construction of a reservoir, for the rural district council.—Mr. E. A. Rankin, engineer, Bourton, Dorset.

WESTMINSTER.—July 8th.—For internal and external painting works and repairs at the Marshall-street public baths, for the city council.—City Engineer, City Hall, Charing Cross-road, W.C.

LANCASTER.—July 8th.—For alterations to the market lavatory, for the corporation.—Borough Surveyor.

ALDERSHOT.—July 8th.—For work at the cemetery, including repairs to walls and fences, for the Burial Board.—Messrs. Friend & Lloyd, architects, Aldershot.

SAFFRON WALDEN.—July 8th-20th.—For additions to hospital, for the Joint Hospital Board.—Mr. H. R. Bird, architect, 10 Union-street, Old Broad-street, E.C.

CARLISLE.—July 9th.—For the extension of electric lighting station, for the corporation.—Mr. H. C. Marks, city engineer and surveyor.

OSWALDTWISTLE.—July 9th.—For the erection of a public library, for the urban district council.—Mr. F. Q. Farmer, architect, 14 Little Park-street, Coventry.

LAUNCESTON.—July 9th.—For the erection of twenty-four cottages, for the corporation.—Town Clerk.

AYR.—July 9th.—For constructional works at the Loch Finlas waterworks, for the corporation.—Mr. John Young, water engineer.

GLASGOW.—July 9th.—For the construction of an embankment on the Clyde for the corporation.—Office of Public Works, 64 Cochrane-street.

HEBDEN BRIDGE.—July 10th.—For repairs to schools, for the Education Committee.—Mr. F. J. MacDonald, Education Offices, Sowerby Bridge.

GLASGOW.—July 10th.—For the digger and reinforced-concrete work at Dalmarnock Bridge new electricity station, for the corporation.—Mr. W. W. Lackie, electrical engineer, 75 Waterloo-street.

WEST RIDING.—July 10th.—For the erection of a school, for the Education Committee.—Education Architect, County Hall, Wakefield.

CROYDON.—July 10th.—For the erection of a school, for the Education Committee.—Education Office, Katherine-street, Croydon.

MILFORD.—July 11th.—For building eleven cottages, for the rural district council.—Mr. S. Waters, clerk.

MIDLETON.—July 11th.—For the erection of twenty-five labourers' cottages, and for the completion of 193 other cottages, for the rural district council.—Mr. J. Stanton, clerk.

HALIFAX.—July 11th.—For the erection of a cable shed at electricity works, for the corporation.—Mr. J. Lord, borough engineer.

CORNWALL.—July 11th.—For the erection of a handicraft centre, for the Education Committee.—Mr. B. C. Andrew, architect, Biddick's-court, St. Austell.

SUNDERLAND.—July 11th.—For the erection of a training college and hostels, for the corporation.—Borough Surveyor.

HITCHIN.—July 13th.—For the erection of an isolation hospital, for the rural district council.—Mr. A. E. Passingham, clerk.

HAMPSHIRE.—July 13th.—For the extension of a school, for the county council.—Mr. A. L. Roberts, architect, The Castle, Winchester.

COVENTRY.—July 13th.—For the erection of two pump-houses at waterworks, for the corporation.—Mr. J. E. Swindlehurst, city engineer and surveyor.

BRIDGWATER.—July 13th.—For alterations and additions to school building, for the Higher Education Committee.—Messrs.—Samson & Colthurst, architects, 51 High-street, Bridgwater.

DUNDALK.—July 14th.—For the erection of forty-six houses and contingent works, for the urban district council.—Mr. M. Sellars, surveyor, Town Hall.

HAMPTON.—July 14th.—For the extension of the isolation hospital, for the urban district council.—Mr. S. H. Chambers, surveyor.

CROYDON.—July 14th.—For the erection of a covered steel shed, for the corporation.—Borough Engineer.

CROYDON.—July 15th.—For alterations and additions to school, for the Education Committee.—Mr. J. Smyth, clerk, Education Office, Katherine-street, Croydon.

KESTEVEN.—July 15th.—For additions and alterations to schools, for the Education Committee.—Mr. H. Donaldson, County Education Office, Grantham.

EXMOUTH.—July 16th.—For the supply and laying of 10-in. cast-iron pipes, sluice valves, 10-in. cast-iron pipe line, 8-in. steel pipe line, and other necessary works, for the urban district council.—Mr. S. Hutton, engineer and surveyor.

HERTS.—July 20th.—For the enlargement of Byng-road county council school, Barnet, for the Education Committee.—Mr. Urban A. Smith, county surveyor, Hatfield.

WEST HAM.—July 23rd.—For the erection of dwelling houses, for the Port of London Authority.—Mr. C. R. S. Kirkpatrick, 109 Leadenhall-street, E.C.

GRANTHAM.—For the erection of two cottages, for the corporation.—Borough Surveyor, Guildhall.

Iron and Steel.

TIPTON.—July 4th.—For the supply of a Lancashire boiler, for the urban district council.—Mr. S. O. Stephenson, engineer and surveyor.

GOOLE.—July 6th.—For the erection of a 4-ton travelling crane, for the urban district council.—The Clerk.

BELPER.—July 9th.—For laying cast-iron mains, for the rural district council.—Mr. G. Pym, clerk.

ST. PANCRAS.—July 13th.—For supplying and fixing a Cornish boiler at public baths, for the borough council.—Mr. C. H. F. Barrett, town clerk.

CHELMSFORD.—July 13th.—For the supply of cast-iron pipes for water mains, for the corporation.—Mr. G. Melvin, town clerk.

LONDON.—July 16th.—For the supply and erection of steel and iron work at Battersea, for the Metropolitan Water Board.—Engineer, Savoy-street, Strand, W.C.

Roads.

GODSTONE.—July 4th.—For the supply of tar-macadam and bituminous materials, kerbing, channelling, tools, oils and iron goods, and hire of steam rollers, for the rural district council.—Mr. Geo. Crowter, engineer and surveyor.

ILFORD.—July 4th.—For repairing tar-pavings, for the Education Committee.—Mr. H. Shaw, engineer and surveyor.

SAFFRON WALDEN.—July 4th.—For making up a road, for the corporation.—Mr. A. H. Forbes, borough surveyor.

RUISLIP-NORTHWOOD.—July 4th.—For making up Hilliard-street, Northwood (about 600 yds.), for the urban district council.—The Surveyor, Council Offices, Northwood.

RUISLIP-NORTHWOOD.—July 4th.—For making up part of Dene-road, Northwood (about 260 yds.), for the urban district council.—The Surveyor, Council Offices, Northwood.

HARROW.—July 4th.—For the supply of broken granite, granite chippings, tarred granite, and tarred granite chippings, for the urban district council.—The Surveyor.

KEYNSHAM.—July 6th.—For making up a road, for the rural district council.—Mr. H. M. Bennett, surveyor, 36 Corn-street, Bristol.

SEAFORD.—July 6th.—For the supply of [illegible] granite for the urban district council.—The Surveyor.

BROMLEY (Kent).—July 6th.—For works of private street improvement in Somerset-road, Wiltshire-road and St. John's-road, for the rural district council.—The Surveyor, Maulden House, Sidcup-hill, Sidcup.

LOUGHTON.—July 6th.—For the supply of granite and gravel, and hire of steam roller, for the urban district council.—Mr. H. White, surveyor.

SKIPTON.—July 6th.—For the supply of tarred limestone and tarred slag, for the urban district council.—Mr. Aldridge, town hall.

WANDSWORTH.—July 6th.—For making up part of [illegible], for the borough council.—Mr. P. Dodd, borough engineer.

EDMONTON.—July 6th.—For the supply of York stone coping, for the urban district council.—Mr. C. [illegible]

WANDSWORTH.—July 7th.—For wood paving and other works in Streatham High-road, and Streatham-hill, for the borough council.—Mr. P. Dodd, borough engineer, 215 Balham High-road, S.W.

LEWISHAM.—July 7th.—For supplying and laying wood paving, for the borough council.—The Borough Surveyor.

MAESTEG.—July 7th.—For private street improvement works, for the urban district council.—Mr. S. J. Harpur, engineer.

STOKE.—July 8th.—For making up several streets, for the corporation.—Borough Surveyor.

NEWPORT (Mon.).—July 8th.—For private street works, for the corporation.—Borough Engineer.

HAMMERSMITH.—July 8th.—For paving the carriageways and footways of Letchford-mews and Willow-vale, for the borough council.—Mr. H. Mair, borough surveyor.

HORNSEY.—July 8th.—For paving works with creosoted deal blocks, for the corporation.—Mr. E. J. Lovegrove, borough engineer and surveyor.

HACKNEY.—July 9th.—For the construction of carriageways with creosoted yellow deal blocks, for the borough council.—Borough Engineer and Surveyor.

BARNSTAPLE.—July 10th.—For steam rolling and scarifying, for the corporation.—Mr. E. Y. Saunders, borough surveyor.

INVERURIE.—July 10th.—For the construction of concrete pavement and granite kerb, for the corporation.—Mr. J. Milne, burgh surveyor.

DUNSTABLE.—July 10th.—For the supply of broken slag, slag dust and slag tar-macadam, for the corporation.—Mr. W. F. Wilkins, borough surveyor.

ABERYSYCHAN.—July 11th.—For road improvement and sewerage, for the urban district council.—Mr. E. Whitwell, surveyor.

ST. HELENS.—July 13th.—For granite paving work, for the corporation.—Mr. A. W. Bradley, borough engineer.

BROADSTAIRS.—July 13th.—For the supply of a 10-ton steam roller with scarifier, for the urban district council.—Mr. H. Hurd, surveyor.

ROMFORD.—July 13th.—For the supply of blue Guernsey granite, for the rural district council.—Mr. G. Lapwood, highway surveyor.

SOUTHALL-NORWOOD.—July 14th.—For road works, for the urban district council.—Mr. Reginald Brown, engineer and surveyor.

CAERLEON.—July 14th.—For the supply of limestone, kerb, channel, and paving, for the urban district council.—Mr. C. J. Fox, surveyor.

ST. MELLONS.—July 15th.—For widening and improving a road, for the rural district council.—Mr. Gomer S. Morgan, engineer, Pontypridd.

WELLINGTON.—July 15th.—For the supply of tarred macadam and broken granite, for the urban district council.—Mr. G. Riley, surveyor.

CHELMSFORD.—July 15th.—For paving Duke-street with creosoted deal blocks, for the corporation.—Mr. P. T. Harrison, borough engineer.

SHEFFIELD.—July 16th.—For asphalting work, for [illegible]

ARGYLL.—July 18th.—For road repair, widening, and improvement, for the Cowal District Committee.—Messrs. W. & W. Disselduff, joint district clerks, 160 Argyll-street, Dunoon.

MARGATE.—July 20th.—For the supply of 1,500 tons of unbroken pit flints, and 1,000 tons of 2-in. broken and sifted pit flints, for the corporation.—Mr. E. A. Borg, borough surveyor.

PERTHSHIRE.—July 31st.—For the reconstruction of 25 miles of road through Glen Dochart, Glen Falloch and Strath Fillan, in the parish of Killin, for the Western District Committee.—Mr. W. L. Gibson, engineer and surveyor, Post Office Buildings, Dunblane, Perthshire.

Sanitary.

RUISLIP-NORTHWOOD.—July 4th.—For the construction with iron or earthenware pipes of 362 yds. of 9-in. sewer at Eastcote, for the urban district council.—The Surveyor, Council Offices, Northwood.

BRANDON AND BYSHOTTLES.—July 6th.—For sewage works extension, for the urban district council.—Mr. G. G. Donkin, surveyor, Langley Moor.

WEST SUFFOLK.—July 7th.—For the construction of stoneware pipe drain, for the county council.—Mr. W. L. Jenkins, county surveyor, Shire Hall, Bury St. Edmunds.

PRESTON.—July 7th.—For alterations at sewage disposal works, for the rural district council.—Messrs. Myers, Veevens & Myers, 15 Chapel-street, Preston.

WEALDSTONE.—July 7th.—For the construction of rotating sewage distributors, feed pipes, cast-iron socketed pipes, bends, and junctions, for the urban district council.—Mr. H. Walker, engineer and surveyor.

WESTBOURNE.—July 7th.—For scavenging work, for the rural district council.—Mr. J. W. L. Cooper, clerk.

DURHAM.—July 8th.—For the removal of house refuse, for the rural district council.—Mr. J. Menzies, sanitary inspector, Avenue House, Shincliffe, Durham.

WREXHAM.—July 9th.—For work of sewer construction, for the corporation.—Mr. J. England, borough engineer.

BELPER.—July 9th.—For the construction of sewage disposal works, for the rural district council.—Mr. R. C. Cordon, surveyor, Duffield, near Derby.

LICHFIELD.—July 9th.—For the construction of sewage purification works, filters, and manholes, also for laying approximately 1,820 yds. of 15-in., 4,860 yds. of 9-in., and 2,000 yds. of 6-in. stoneware socket pipes, and erecting ventilating columns, for the rural district council.—Mr. C. O. Rawstron, engineer.

ASHFORD.—July 9th.—For the construction of an ejectment station with pneumatic ejectors and air-compressing plant, 240 yds. of 6-in. rising main, and a set of sewage purification works, for the West London District School Managers.—Mr. Arthur Martin, 7 Victoria-street, Westminster, S.W.

HARROW.—July 11th.—For works of sewerage, for the urban district council.—Mr. J. P. Bennetts, engineer and surveyor.

ECCLES.—July 11th.—For a 5 to 6 b.h.p. oil engine, and 5-in. centrifugal pump piping, for the sewage disposal Committee.—Mr. G. W. Willis, sewage works engineer and manager, Peel Green-road, Patricroft.

BARROWFORD.—July 11th.—For the construction of sewage disposal works, for the urban district council.—Mr. F. Sutcliffe, surveyor.

HENDON.—July 13th.—For the removal of house refuse, for the urban district council.—Mr. S. S. Grimley, surveyor.

LEYBURN.—July 14th.—For laying sewers and constructing sewage disposal works, for the rural district council.—Mr. F. J. Rodwell, engineer, 37 and 38 Prudential Assurance Buildings, Park-row, Leeds.

WALTON-ON-THAMES.—July 14th.—For laying iron and stoneware sewers, for the urban district council.—Mr. R. Wilds, surveyor.

SEFTON.—July 15th.—For the construction of pipe sewers, for the rural district council.—Mr. J. T. Wood, engineer, 3 Cook-street, Liverpool.

SCARBOROUGH.—July 15th.—For a sewage purification installation, for the rural district council.—Mr. J. A. Iveson, surveyor.

SOUTH SHIELDS.—July 16th.—For the construction of sewers, for the corporation.—Mr. L. Roseveare, borough engineer.

RAWTENSTALL.—July 16th.—For the construction of sewers and manholes, for the corporation.—Mr. J. Johnson, borough engineer.

The Surveyor

And Municipal and County Engineer.

Vol. XLVI. JULY 10, 1914. No. 1,173.

Minutes of Proceedings.

Rural Road Administration.

One of the most interesting of the papers read at the annual meeting of the Institution of Municipal and County Engineers was that on the "Control, Management, and Maintenance of Rural Roads," by Mr. J. F. Hawkins, county surveyor of Berkshire. This paper, together with the discussion, is reported in another part of the present issue. Mr. Hawkins discussed the relations between road authorities—more especially with regard to the sizes of the areas controlled—and he expressed himself as strongly in favour of important changes. The considerations to which he drew attention may be regarded as pointing to the desirableness of combining small areas, or of suppressing rural districts altogether as far as their highway duties are concerned, bringing all rural roads under the management of the county councils. Some highway engineers, on the other hand, may consider that his presentment of the position points to the advantages of creating, in effect, a single road maintenance service by the establishment of suitable relations between the existing authorities, the equitable adjustment of the cost of maintenance, and the establishment of a system under which all highway surveyors would be virtually members of one organisation. It may be taken for granted that those who hold views such as these recognise that an essential element of such a system is the establishment of effective control by the central authority, especially as regards the pay, promotion, and security of tenure of road engineers. As we have more than once pointed out, matters have for some time been tending towards developments which will leave but two alternatives—there will either be a distinct road engineering staff under the direct control of the central authority, and armed with considerable powers as regards inspection and reporting, or there must be established such a system that all surveyors will be virtually members of a single corps, the position of each individual being exactly defined as regards those above and below him in rank. As was pointed out in the discussion by Mr. Weeber, the present administrative counties are in many cases quite unsuitable as highway units, and it may therefore be pointed out that the constitution of the county as the unit of rural highway administration is by no means an essential element of the kind of reorganisation which we are now contemplating. If the surveyor of each area, county or district, were, in the new organisation, given the grade appropriate to his actual position and responsibility, it would not be necessary to give the counties separate control over rural areas except in so far as the county surveyor would usually be the most conveniently located senior officer.

Special attention may be directed to our report of the remarks made by Mr. Frank Harris, whose wholesome and timely contribution to the discussion shows, we trust, that a stage has now been reached at which it will be possible for rural and county surveyors to identify their interests in order that the new organisation may be as satisfactory as possible to highway surveyors generally. A consideration which points to the advantage of a general superior control was suggested by Mr. H. J. Clarkson's account of an incident on the borders of four counties; and it may be pointed out, in support of the view expressed by Mr. R. Oakden, that the boundary line between adjacent areas of road administration, counties, or districts is often so situated that road work over considerable areas is divided among different staffs just where, owing to natural conditions, it should be carried out by a single department for the sake of economy. Mr. Montagu Harris's thoughtful contribution to the discussion seemed to create a very good impression, and Mr. E. P. Hooley remarked later that if road surveyors were to throw in their lot with the County Councils Association they might do much to solve their difficulties. As a whole, the discussion provided very satisfactory evidence that the relations between county and district surveyors are far more cordial than they were quite a short time ago. We have persistently worked to bring about such an understanding, and we trust that good relations may be so developed that the establishment of an effective organisation without undue predominance of central control may be happily consummated.

Economies In Road Construction.

Mr. Francis Wood's contributions to the subject of road construction and maintenance are always welcome. Some excellent points were made in the paper which he read at the annual meeting of the Institution of Municipal and County Engineers, and the reader of our report on this paper and the discussion which followed it will not fail to observe that in several matters precise knowledge of the behaviour of road materials seems to have advanced quite definitely in the past twelve months. Mr. Wood's paper is one which does not lend itself to brief and illuminating comment, but attention may be directed to individual points of especial importance. In view of the steady increase in the price of certain bituminous materials, it is interesting to note that the price of timber used for wood paving in the London area has also increased by about 20 per cent within the past few years. As regards theory, a passage in Mr. Wood's paper in which asphalt and macadam surfaces are compared with respect to resistance to traction must be mentioned on account of the possibility that it might be misconstrued by our younger readers. The conclusion that on certain assumptions an asphalt surface is better than macadam in the proportion of four to one, "so far as traffic is concerned," must be taken strictly within limitations. Tractive resistance is only one element, and, especially in city streets, another very important element is the efficiency of the paving as regards the rapid starting and stopping of vehicles. Another point which should not escape notice is that, in considering the behaviour of asphalt as regards dry slipperiness and wet slipperiness, Mr. Wood fails to point out that under some weather conditions hard and impervious surfaces are damp when softer and more porous surfaces are practically dry; or the hard surface may be wet when other surfaces are only damp. This consideration does not in the least detract from the force of Mr. Wood's remarks, but it is one which has to be reckoned with as a factor in road maintenance.

One of the most important of the considerations raised in this paper is that the limitation of grade to one in forty applies to certain bituminous compositions which resemble very closely those which have lately been advocated by several surveyors and others as suitable for country roads. It is not suggested that these surfaces will be laid in places for which they are unsuitable, nor is it intended to convey the idea that they cannot be so made as to provide a good hold on grades steeper than one in forty or one in thirty-five; but the limitations of surfaces of this kind in undulating or hilly country must be faced, and the more so that under modern conditions of haulage it will seldom be economical to reconstruct roads with much easier gradients. It is cheaper to climb up the hills and to coast down them without using power.

* * *

Pure Water and Health Statistics.

It is doubtful whether we yet have a true grasp of the relative importance and value of pure water. It is not to be doubted that the contradictory teachings of the scientific investigator leave us in a state of doubt. The bacteriologist, in particular, is very indefinite, and after an exhaustive study of the opinions of various authorities it is by no means clear whether any water can be said to be unsafe for drinking purposes unless certain well-known disease producing germs are actually known to be present. We are told that even sewage-polluted water is not necessarily harmful. It seems that even if typhoid organisms exist they tend to disappear rapidly with a few days' storage; in fact, from one point of view it seems to be quite extraordinary that even a badly polluted water should have any marked effect upon the death-rate, seeing that even if the disease germs are consumed by an ordinary person, that person probably possesses in himself powers of resistance that will safeguard him from the ill effects that might ordinarily be expected. We are told that there are many other causes for typhoid, and that water is not the only cause. On the other hand there are those who tell us that the coli are themselves capable of producing disease, that it is practically impossible to obtain pure water in a natural state. The possibilities of accidental specific pollution of the present supply are shown to be great and serious. We are assured not only that typhoid is caused by polluted water, but that the general health of the district is affected in other ways. Under these circumstances we fall back upon common sense, and use a water or purify it to such a degree as may seem to be reasonable, without having any fixed standard to go upon. Without any very clear reason it is generally accepted that such and such a water is good enough. The coli figures may be comparatively high, the filtering arrangements may be poor, the storage may be insufficient, but we have a death-rate somewhat lower than that of some of the great towns, and we take this as sufficient evidence that it would be extravagant or unnecessary to adopt methods which would undoubtedly produce water of greater purity.

Following this common-sense reasoning, it is interesting to read the statistics from America showing what has happened in eight cities since hypochlorite treatment of the water has been adopted. These figures appear in the *Engineering Record* of New York, and are quoted from a paper read by Mr. C. A. Jennings before the Illinois Water Supply Association, which is referred to more fully elsewhere in these pages. Of the eight cities, the maximum reduction in the typhoid fever death-rate was 72 per cent in Cleveland and the minimum 35 per cent in Baltimore. The average was 51 per cent. These figures clearly show that hundreds of valuable lives have been saved since the water was sterilised, but for every death from typhoid there must surely be a number of cases where the patients recovered. The actual number of persons who have been saved from having this terrible sickness is unknown. Here there is common-sense evidence of the value of sterilisation. Is it sufficient to acquiesce in allowing the death and disease rate to stand at a figure which might be reduced merely because it is low? It seems rather that common sense would dictate that every possible step should be taken to make water absolutely pure. What sacrifice would be too great to prevent the case of sickness or death which comes near home?

* * *

The Sanitary Institute at Blackpool.

The twenty ninth annual congress of the Royal Sanitary Institute, which concludes to-morrow, has been made the occasion of the usual conferences of the several classes of public officials who are concerned with various phases of public health administration. The close connection which necessarily exists between the ordinary daily work of the municipal engineer and surveyor and the practical application of sanitary science to the solution of many problems affecting the public health hardly needs to be pointed out. At all events, the inclusion of a conference of engineers and surveyors to county and other sanitary authorities in the programme of the Blackpool Congress will, no doubt, be regarded as a thoroughly appropriate feature of the proceedings. This conference was presided over by Mr. J. S. Brodie, M.INST.C.E., the borough

engineer of Blackpool, who, in opening the proceedings, shortly reviewed the progress of municipal engineering in its relation to sanitary science during the past twelve months. Starting with a brief reference to highway engineering, Mr. Brodie recalled two of the conclusions arrived at by the Third International Road Congress which was held in London last year. These had reference respectively to the selection of hygienic bituminous binders and the precautions to be taken in order to remove any objection to wood paving from a sanitary point of view. Dealing next with housing and town planning, the president of the conference reviewed the progress which has been made since the passing of the Act of 1909, and alluded favourably to the recently issued amended town planning procedure regulations by which the preliminary work, especially in the preparation of maps, has been simplified without sacrificing any necessary safeguards. Turning to the question of water supply, we are glad to observe that Mr. Brodie had something to say in regard to the desirability of dealing with public water supplies as a whole, instead of each community rushing to be first in the field to secure its own particular requirements. This question is one upon which we have frequently expressed our views, and we welcome every indication of the formation of a strong expert and public opinion on the subject. As regards sewerage and sewage disposal, too, increased efficiency and decreased cost could often be secured by co-operation between neighbouring authorities, as in the recent instance of Rochester and Chatham. The last subject upon which Mr. Brodie touched was the very difficult one of municipal labour unrest. An excellent address concluded with a vision of the future, when the labours of sanitarians shall be crowned by the attainment of health and happiness by every member of the community.

* * *

Housing the Labouring Classes.

It was an excellent idea of the proprietors of *Concrete and Constructional Engineering* to offer a number of prizes varying in value from 100 to 10 guineas for designs of small cottages suitable for rural districts, the cost of which was not to exceed £125 each, exclusive of builder's profits. The result has been that no fewer than 249 designs have been submitted by architects and others. The designs are on exhibition this week in the Lecture Hall of the Surveyors' Institution, 12 Great George-street, Westminster, S.W., and are well worth inspection.

It would be impossible to give even the barest description of the numerous designs, which are well hung on screens; suffice it to say that they all contain the following accommodation: Small entrance hall, kitchen living-room, three bedrooms, scullery, larder, water-closet, and fuel store. A large number of them are only one-story buildings, and, of course, they are all, more or less, constructed of concrete. The first prize of £105 has, as stated elsewhere in this issue, been awarded to Mr. Ernest S. Thompson, a Westminster architect, who has strictly adhered to concrete throughout. His design has many novelties, and is of a bungalow type with a flat projecting roof of reinforced concrete. The interior arrangements have been well designed to prevent any waste of domestic labour, and seems to meet all the requirements of a cheap, substantial, attractive cottage. It would be a worthy enterprise if someone would erect a few cottages of this type, and possibly others from the chosen designs, in order to see if they could be erected at the price, and also to ascertain, if possible, the class of cottage which would be most popular among the labouring classes. The proprietors of *Concrete and Constructional Engineering* are to be warmly congratulated on their enterprise in having initiated this competition on lines which are so thoroughly practical and so devoid of the usual sentimental theorising which is too often adopted when dealing with this difficult and complicated problem.

* * *

Housing at Merthyr.

The housing problem with all its characteristic features has had to be faced by the Merthyr Corporation for some years past, very largely owing to the necessity which has existed for clearing away tenements of the hovel type. Here, as elsewhere, the absurdity of a policy of mere demolition without the provision of decent dwellings as substitutes for those pulled down has had to be recognised. Private enterprise has failed to meet the needs of the population to an adequate degree, and consequently the corporation have been obliged from time to time to undertake the erection of municipal cottages. And here they have found themselves up against the problem of the economic rent. The 300 houses which have so far been erected are let at such a rent as makes the income which they produce commensurate with the outlay involved. It has now become necessary, however, to proceed with a new scheme, and it has been decided to erect an additional 88 houses in order to meet the needs of people who are at present living in insanitary dwellings. A calculation by the borough architect has shown that, comparing the cost and the weekly rentals, on an average for every £3 of capital expenditure the weekly rent is 1d. On this basis it is probable that the weekly rent of the new dwellings will have to be fixed at the rather high figure of 6s. 9d., and some apprehension has been felt as to the view which will be taken by the Local Government Board of so comparatively large a rental. It has been decided, therefore, that for every £3 which can be saved on each house by economies, the rent is to be reduced by 1d. a week. Here is a great incentive to the committee and their architect, and it will be interesting to see whether it results in the application of any novel ideas of construction which may prove a good example for others to follow.

* * *

"Pestering" the Redruth Surveyor.

"Pestering the Surveyor" is the heading which the *Western Daily Mercury* gives to a report recently of the proceedings at the Redruth Urban District Council, and the phrase is quite typical of what many municipal engineers have to contend with in the daily discharge of their duties. In this particular instance the pestering assumed the familiar form of blaming the surveyor without due cause—without, indeed, any cause whatsoever, seeing that the official was acting according to instructions received. The expenditure was stated to have increased £20 a fortnight, and this was characterised by a councillor as a most serious thing. The surveyor explained that an extra amount of stones was being broken, and that some tar-spraying was being done, and the chairman of the Finance Committee added that extra men were being employed. "You want work done," he said, "and that means you will have to increase the staff. The employment of men means money." Anything more obvious than this it would be impossible to imagine, yet to the mind of one doubting councillor it made only a vain appeal. "You are always pestering the surveyor," exclaimed another councillor in a forcible sentence, "to go on with this and that job, and while that kind of thing continues the wages are bound to go up." This declaration epitomises the hardship of a position whose exacting conditions are too often requited by undeserved censure.

Some Notes on Highway Law as Affecting the Municipal Engineer.*

By SYDNEY G. TURNER, A.M.INST.C.E., Barrister-at-Law.

After dealing with the subject historically, Mr Turner went on to deal with—

THE REPAIR OF HIGHWAYS.

The following notes are based upon the chapter on Highways in the author's work on "Public Health Law," and on the articles contributed by him to "Practical Road Engineering," edited by Mr. H. Percy Boulnois, M.INST.C.E., &c.

It does not follow that because a road is dedicated to the public and becomes a highway, the highway authority are liable to its repair and maintenance.

Mr. Sydney G. Turner.

Prior to the passing of the Highway Act, 1835, no distinct Act of adoption was necessary in order to make a parish liable to repair a public road; if the road was dedicated to and accepted by the public the parish was at common law *primâ facie* bound to repair it (*Rex* v. *The Inhabitants of Leake*, 1833, 5 B. and Ad., 469). Since 1835, however, some formal Act of adoption has been required before a highway authority becomes liable for the repair of a new highway. This form of adoption may take place in either of three ways—viz.: (*a*) The formalities prescribed by sec. 23 of the Highway Act, 1835, may be observed; (*b*) a highway may be adopted by notice declaring it to be a highway repairable by the inhabitants at large, under sec. 152 of the Public Health Act, 1875, or sec. 41 of the Public Health Acts Amendment Act, 1890, in districts in which that section is in force; (*c*) a highway may be adopted by notice under sec. 19 of the Private Street Works Act, 1892, in districts in which that Act is in force. In the case of a highway dedicated since 1835 there is no liability on the part of the highway authority to repair unless one of these three courses of procedure has been followed (*Eyre* v. *New Forest Highway Board*, 1892, 56 J.P., 517).

Apart from the appropriate remedies for any default in the execution of their statutory duty, a highway authority will not be held liable for a mere omission to repair (*Cowley* v. *Newmarket Local Board*, 1892, A.C., 345), although they are liable for any injury or damage caused by any act done by them on a highway (*Hill* v. *Tottenham Urban District Council*, 1898, 79 L.T., 495). As regards the manner of repair, some interesting cases have been decided in recent years. The leading case is *West* v. *Bristol Tramways Company*, 1908, 2 K.B., 14, where the plaintiff, a market gardener, successfully claimed damages for injury to plants and flowers caused by the fumes emanating from creosoted wood paving. The case was decided on the ground that the defendants had no statutory authority to use creosoted wood, but that their only statutory obligation was to pave, and a material which would not have caused damage might have been used. In these circumstances, having elected to use creosoted wood, they did so at their peril, and having exercised their statutory powers negligently, they were held liable for the damage caused. The principle of this case has since been applied in a case against the Kent County Council (decided in the County Courts, where a cow was killed through drinking water which had been polluted by tar washed from road surfaces. In this case, as in the Bristol case, it was held that the treatment of the road with tar was not the only method available, and was not, therefore, absolutely necessary for carrying out the duties laid by statute upon the council. Two other cases may, perhaps, here be noted. The first was tried in the Swansea County Court, and damages were recovered against the Glamorganshire County Council, who had omitted to warn the public of extensive tar-spreading operations which were in progress. In the other case, which arose in Ireland, a cyclist recovered damages against an urban district council for injuries received owing to the slipperiness of a highway which had not been sanded after tarring.

By the Local Government Act, 1888, the duty of repairing main roads is cast primarily upon the county councils. By sec. 13 of the Highways and Locomotives (Amendment) Act, 1878, any road which has, within the period between December 31, 1870, and August 16, 1878, ceased to be a turnpike road, and any road which being on August 16, 1878, a turnpike road, may afterwards cease to be such, shall be deemed to be a main road. The same Act contains provisions by which any highway which in the view of a highway authority ought to become a main road, by reason of its being a medium of communication between great towns, or a thoroughfare to a railway station, or otherwise, may be declared to be a main road by an order of the county council made on the application of such highway authority. Before this order becomes operative, however, the road must be put in proper repair and condition to the satisfaction of the county council (Local Government Board Act, 1888, sec. 11 [7]). Further, a main road may lose its status as such, by an order of the Local Government Board made on the application of a county council. Sec. 11 (1) of the Local Government Act, 1888, enacts that main roads shall be wholly maintained and repaired by the council of the county in which they are situate, and such council, for the purpose of the maintenance, repair, improvement, and enlargement of, and other dealing with such road, shall have the same powers, and be subject to the same duties, as a highway board.

Several cases have arisen as to what is included in the term "maintenance" as applied to a main road. It has been held to include the removal of an obstruction—*e.g.*, snow which renders a road impassable (*Guardians of Amesbury Union* v. *Wiltshire*, JJ., 1883, 10 Q.B.D., 480); scavenging and watering in so far as they are necessary for keeping a road in repair, but not when merely done for the purpose of enabling passengers to use a road with greater comfort (*Mayor, &c., of Burnley* v. *Lancashire County Council*, 1889, 54 J.P., 279); it is submitted that this decision would be equally applicable to any form of surface treatment. On the other hand, "maintenance" does not include lighting; nor does it include the conversion of a macadamised road into a paved road (*Leek Improvement Commissioners* v. *Staffordshire*, JJ., 1888, 20 Q.B.D., 794). It is submitted, however, that works of this character, and also the substitution of a waterproof for a water-bound road would be included in "improvement of" or "other dealing with" a road under sec. 11 (1) of the Local Government Act, 1888. The particular works which may be executed for the purpose of maintenance, repair, &c., under this sub-section are in the discretion of the county council, a discretion with which the Courts will not interfere unless it is proved that it is not being exercised in

* Paper read at the annual meeting of the Institution of Municipal and County Engineers at Cheltenham.

good in the *Mayor &c. of Wednesbury* v. *Lodge Holes Colliery Company, Limited*, 1907, 1 K.B., 78).

The Local Government Act, 1888, contains provisions for the maintenance of main roads by urban authorities either at their own request, the county contributing a contribution to the cost, or by contract with the county council. The powers and duties of an urban authority in regard to such main roads are generally similar to those in regard to the roads vested in them. The county council are not necessarily liable for the whole amount incurred in respect of repair and maintenance, although in certain cases they may be. In default of agreement the amount must be determined by the Local Government Board (*In re Lowestoft and County Council* v. *Rural Urban Sanitary Authority*, 1894, 2 Q.B., 786). When the cost of maintenance has been determined to be an urban authority, not out of current rates, but out of a loan, the amount of such loan for the purposes of the contribution to be made by the county council should be ascertained, not with reference to the total amount of the loan, or so much thereof as has been expended within the year upon such costs, but with reference to the amount of the instalments which the urban authority have to repay during the year, or the sum which it pays into a sinking fund during the year, for the liquidation of such loan as the case may be (*Mayor &c. of Penzance* v. *Western County Council*, 1891, 28 L.T., 213). The contribution to be made by the county council must be in respect of the actual expenditure of the particular year, and not a fixed sum to be arrived at by taking the average expenditure over a series of years (*Southport Urban District Council* v. *Lancs County Council*, 1898, 79 L.T., 125).

EXTRAORDINARY TRAFFIC.

"Extraordinary traffic" is a technical term which includes all such continuous or repeated user of the road by a person's vehicles as is out of the common order of traffic, and as may be calculated to damage the highway and increase the expenditure on its repair (*Hill* v. *Thomas*, 1898, 2 Q.B., at p. 340). It is really a carriage of articles over the road, at either one or more times, which is so exceptional in the quality or quantity of articles carried, or in the mode or time of user of the road, as substantially to alter and increase the burden imposed by ordinary traffic on the road, and to cause damage and expense thereby beyond what is contemplated. "Extraordinary traffic" was first dealt with in the Locomotive Act, 1861, by way of prohibition. This was, however, repealed by the Locomotive Act, 1865, and since that date the object of the Legislature has not been to prohibit the traffic but to secure to highway authorities the right to recover expenses incurred by them in the repair of roads damaged by it. The matter is now governed by sec. 23 of the Highways and Locomotives (Amendment) Act, 1878, as amended by sec. 12 of the Locomotives Act, 1898, the provisions of which have given rise to an enormous amount of litigation. In the article which he contributed to "Practical Road Engineering," the author ventured to predict that questions would arise as to the liability for injury to the surface of roads—and particularly of newly waterproofed surfaces—caused by non-skidding devices attached to the wheels and tyres of traction engines and motor cars, and he then pointed out that, although the rules laid down by the Court of Appeal in *Hill* v. *Thomas* (*supra*) might be extended to apply to such cases, it must be remembered that that case was decided in 1898, and that the Court had not in their minds the changed conditions of to-day. Another question is now to the front. The spread of the motor omnibus is playing havoc with many a macadamised road, and some authorities appear to have taken the view that motor-omnibus traffic is "extraordinary traffic," and that consequently they can recover the cost of repairing the roads from the companies concerned. The matter is a novel one, but it is submitted that this view is wrong. The following observations of Mr. Justice Wills in *Hemsworth Rural District Council* v. *Micklethwaite*, 1904, 68 J.P., 345, appear to be applicable to the cases both of the non-skidding devices and of the motor omnibus: "Traffic must of necessity, as time goes on, vary in its character according to the development of the various industries in the neighbourhood, and traffic which in one year or at one given time may be extraordinary traffic will, in the course of time—and it may be in the course of a comparatively short time—become ordinary traffic. Therefore, I think that, in considering whether traffic is extraordinary or not, it is not sufficient to take simply the year to which the question relates and compare other traffic on the road during that year with the traffic complained of. That would be a fallacious test. The test is, whether the particular traffic in question has, by the usage of trade and of society, and by the varying circumstances applicable to the case, by that time become such as can fairly be called ordinary traffic."

In order to afford definite basis for discussion, Mr. Turner, in conclusion, quoted some suggestions for reform made by Mr. and Mrs. Sidney Webb.

THE RESULTS OF HYPOCHLORITE TREATMENT OF WATER.

In a paper read before the Illinois Water Supply Association by Mr. C. A. Jennings, which is quoted in the *Engineering Record* of New York, it is shown that 600 cities in the United States are using hypochlorite for water sterilisation. It is further shown that no city following its use has found it necessary to discontinue its use. Where poorly designed plant and improper working have led to trouble the method has, however, fallen into undeserved disrepute. It has sometimes been assumed that the application of hypochlorite would remedy a condition quite outside the sphere of its usefulness.

Statistics were quoted in this paper showing the results obtained at eight American cities where hypochlorite sterilisation has been adopted. On the eight cities the maximum reduction in the typhoid death-rate was 72 per cent at Cleveland and the minimum 35 per cent in Baltimore. The average reduction was 51 per cent. The total population considered was 2,033,000, with a reduction per 100,000 population for each year of 15·8 deaths.

At Baltimore, hypochlorite treatment of the water was started in June, 1911. Here the death-rate from typhoid fever was 35·2 per 100,000; during the period from 1900 to 1910 this death-rate fell to 22·8 per 100,000 in 1912-1913 after using hypochlorite. At Cleveland, where the treatment started in September, 1911, the death-rate fell from 35·5 during the preceding ten years to 10·0. At Des Moines the treatment was started in December, 1910. Here the death-rate fell from 22·7 during the preceding five years to 13·4. At Erie the treatment was started in March, 1911. The death-rate in this case fell from 38·7 in the preceding ten years to 13·5. At Evanston, where the treatment was started in December, 1911, the death-rate fell from 26·0 during the preceding three years to 14·5. In Jersey City the treatment was started in September, 1908, and the death-rate, which was 18·7 during the preceding seven years, fell to 9·4. At Kansas City the treatment was started in January, 1911, and the death-rate fell from 42·5 during the preceding ten years to 20·0. At Omaha the treatment was started in May, 1910, and the death-rate, which was 22·5 from 1900 to 1909, fell to 11·8. Such are the beneficial results of water sterilisation in America.

RESIGNATION OF THE BOROUGH SURVEYOR OF GUILDFORD.

Mr. C. G. Mason, who has been borough surveyor of Guildford for eighteen years, tendered his resignation to the town council last week. The matter was taken in committee, and the following communication was made officially to the Press: "The borough surveyor tendered his resignation to the council, and at the same time thanked the council for the invariable kindness with which he had been treated during the last eighteen years. The council accepted the resignation and appointed a special committee to bring up a report as to the terms of appointment of his successor."

It is understood that the resignation took effect immediately.

Mr. Mason was in his early days articled to the borough engineer of Portsmouth, and subsequently he filled various positions on the staff of the then borough engineer, Mr. H. Percy Boulnois, M.INST.C.E., finally becoming highway surveyor. He obtained his Guildford appointment in 1896. Mr. Mason is an associate member of the Institution of Civil Engineers, and also a member of the Institution of Municipal and County Engineers.

ment of the result of the £125 Concrete Cottage Competition. The assessors, in their report, express their satisfaction with the number and general cha-

Ernest S. Thompson, architect, 5 Victoria-street, Westminster, S.W.; the second prize of 50 guineas to Mr. Chas. Bulman Pearson, Licentiate R.I.B.A., of

ance of the designs which show the interest taken by the cottage type of plan, economic problem of cheap cottage building. Two hundred and forty-nine drawings were received.

The first prize of 100 guineas was awarded to Mr.

109 Harley-rd, Chiswick, W.: the third prize of 2½ guineas to Mr. Harold G. Holt, A.R.I.B.A., 11 Probyn-road, Wallasey, Cheshire; and the fourth and fifth prizes of 10 guineas each to Messrs. Leonard G. Hammond, 42 Rock Park, Rock Ferry, Cheshire, and M. Crosnier, 20 Brechin-place, South Kensington. Two consolation prizes of 5 guineas were also awarded to Messrs. J. Cooke & T. Hill, 20 Stanhope-buildings, Stamford New-road, Altrincham, and F. W. Stubbs, A.R.I.B.A., Grayshott, Marlborough-road, South Croydon.

The assessors were Mr. Max Clarke, F.R.I.B.A., Prof. Beresford Pite, F.R.I.B.A., and Mr. Edwin O. Sachs, F.R.S.E.

The entire drawings sent in will be exhibited at the Surveyors' Institution (lecture hall), 12 Great George-street, Westminster, S.W., July 6th to 11th, inclusive, 11 a.m. to 6 p.m. daily.

ENGINEERING JOTTINGS.

VI. MUNICIPAL PLAYGROUNDS.

By Herbert G. Coales, Assoc.M.Inst.C.E., F.S.I.

The public school without good playing fields does not command the same popularity as one well equipped in that respect. To some extent it is the same with towns: people will generally give a good name to a town which has ample facilities for recreation and sport.

What is the duty of the local authority in the matter of the provision of parks, pleasure and recreation grounds? Where is the line to be drawn? If one set of people has cricket pitches provided for it, should another—richer, perhaps—have a polo ground assigned? Likewise, if a class of citizen prefers to take his rate-provided amusements on land, would another class be justified in asking for equal facilities on water? It is not difficult to draw the line for most of the civic services; but in catering for recreation it is easy to see that a town might be lavish or niggardly, and in either case might at the same time be unfair and partial.

Playgrounds are places where games can be played, and the ordinary open space or ornamental enclosure is not the subject of this note. Of course, towns must have lungs, but most people are not satisfied with just breathing—they want exercise, violent or otherwise.

It has been reported that Berlin has recently decided to purchase from the Prussian Government 27,000 acres of forest land situated in the immediate neighbourhood of the city. The price to be paid is about £2,500,000 sterling. The transaction is the outcome of a movement in favour of surrounding all large towns with an inviolable "girdle of woods and meadows." What a delicious prospect the news opens out! A poor old woman, seeing the sea for the first time, exclaimed: "Thank God I've seen something there's enough of!" Surely the German townsman will be satisfied with the purchase of land on such a scale!

English cities, having acquired large tracts of land around their borders, would be able to cater for the recreation of their people if they so decided. So far Parliament has discouraged speculation in land by municipalities; but a change is due, and no doubt more progress will be made in the future in this direction. It may be socialistic in effect, but, as a late Chancellor of the Exchequer observed, "we are all socialists nowadays." By charges and tolls it is possible for the municipality to make its adult citizens pay towards the upkeep of well-kept lawns or greens, and the provision of artificial lakes. In this case the arrangement would seem to be fair. The golfers and bowlers would pay a green fee, the rowing people would be charged for their boats, and the tennis players for their courts. The old gentleman who takes his recreation in his easy chair at home would have the satisfaction of knowing that the people who "wasted" their time in playing games were being made to pay something. Unless payment were exacted, and the court or green reserved, players would not get much enjoyment out of publicly provided facilities for tennis or golf, for children and others would overrun the place, and all balls would be quickly confiscated.

In time, the provision of plenty of playing fields would lead more people to exercise themselves instead of merely watching others—many of whom are paid to play. At the present moment, no two rival towns would dream of playing off a match on a public recreation ground where they could not take gate money. Subscriptions cannot be counted on to any extent in the interests of sport, but for the sake of the takings.

When one begins to schedule out a list of games and recreations for which a town might legitimately make public provision, an old-fashioned man wonders what the world is coming to, for it would contain every outdoor pastime, with the exception, possibly, of fox hunting, horse racing, and bull fighting. The law being adapted to the new order of things, power would be given to the local authority to develop and utilise its big land purchases in the most sensible and far-seeing way. Ample sites could be reserved for future building operations, and it would not be necessary to hold the municipal golf course sacrosanct for ever. The greens could gradually be pushed further out as the bricks and mortar advanced. Judicious laying out and management of the bought-up land would prevent intolerable burdens being cast upon the ratepayers. The engineer would plan out the roads for the future development of the property; but only present requirements would be met, and many of the streets would be merely on paper. The artificial lake would be contoured out and constructed (a structural one were absent), and would serve for skating in the winter as well as for boating in the summer. The poorest of the land would be set apart for the golf links, and the best turf could be used for the tennis courts and the bowling greens. The boy scouts would be given a clearing in the wood for their camp, and the rifle range would be on the outskirts of the property.

The provision and laying out of the extensive municipal playground in the future, therefore, may be a very important part of the town engineer's duties. When people have got accustomed to the idea of publicly provided facilities for sport, they would ask the governing body to buy land for that purpose and lay it out, and, after all, it will not be such a very long step from the recreation grounds we know to the more extended playing grounds with the more ambitious list of games to be catered for. Nor must it be forgotten that any argument against a public golf course or a tennis court applies equally against public bands, public baths and public libraries.

Very few people can own to have the run of private parks or water, and only by corporate means can facilities be given the ordinary town inhabitant for the enjoyment of "woods and meadows" to the fullest extent. Indeed, few Britishers enjoy the open air to the fullest extent without participating in games.

Coast Sand Dunes, Sand Spits, and Sand Wastes. (By Gerald O. Case. London: St. Bride's Press, Limited, 24 Bride-lane, E.C. 5s. nett.)—While a good deal of attention has been directed in recent years to the question of coast erosion, but little has been said of the changes made by the wind on sandy shores. . . . The subject is certainly of sufficient importance to deserve more attention than it has hitherto received, and in discussing the nature of the groynes, embankments, &c., as well as of the vegetation best suited to arrest the movements of sand, Mr. Case has made distinct progress towards the solution of a difficult problem.—*Journal of the Society of Arts.*

Tar Grouting in Perthshire.—In his report for the year ended May 15th last, Mr. W. L. Gibson, surveyor for the Western District of the Perthshire County Council, says he is still of opinion that the tar-grouting system is the most efficacious for the maintenance of main roads in this district. It is now over six years since the first length of this method of construction was laid on the Great North Road. During that period it has only been once tar-painted at a cost of 1½d. per super. yard; and at present, although the surface is showing signs of disintegration, its construction generally appears as if it would last for at least another season or two if the surface is again tar-painted. "All the other lengths since laid down, which have been carried out under grants from the Road Board, are also," Mr. Gibson adds, "showing good results, and although it still seems quite impossible at present to reconcile the wishes of horse and motor users alike in the matter of surface, the tar-grouting system goes a long way towards meeting the wishes of both. The tar-painting of the surfaces helps greatly to prolong the life of the metal bed and to minimise the dust nuisance; where this system of maintenance is adopted on roads where mechanically propelled traffic exists the economy in the saving of road maintenance must be considerable."

Institution of Municipal and County Engineers.

ANNUAL MEETING AND HOUSING AND TOWN PLANNING AND ROADS CONFERENCES AT CHELTENHAM—(3).

Following the proceedings in the Royal Section at the recent annual meeting of the Institution of Municipal and County Engineers—Mr. H. T. Wakeford, M.Inst.C.E., in the chair—the undermentioned paper was submitted for discussion:

CONTROL, MANAGEMENT AND MAINTENANCE OF RURAL ROADS.

By J. Fred. Hawkins, M.Inst.C.E.,
County Surveyor of Berkshire.

The work in connection with the rural roads has been but poorly done in the past by too many road authorities and by diversity of methods. It can fairly be taken that all will be unanimous in the opinion that the more any area or system is split up the less is the result obtained. The smaller the authority the less the salaries, and the less the likelihood of obtaining well-qualified men to fill appointments. The smaller the authority the less the chance of public men of ability and position taking their share of duty to their country.

To-day with the rural roads it can be shown in counties that the work now split up into small areas is not so well or efficiently carried out as in the old large rural area days. If this is a fact, it surely goes far to prove that a larger authority, such as a county council with an efficient staff, could manage a combined country area better than groups of smaller areas practically carrying out work that should be managed by one central authority, and goes far to substantiate the old adage, "United we stand, divided we fall."

This is the more marked when one considers how altered everything is since the advent of self-propelled traffic. Nowadays it is not the country cart that has to be catered for, doing at the outside its 20 miles per day, but the ubiquitous motor or motor lorry that travels its 120 or 150 miles per day.

Fancy a car on a journey travelling through twenty different road areas in a day and the cost of the damage not being contributed towards in any one of those areas. If the whole area damaged could be placed under one rating authority, and the cost of repairs paid for by one, the general fairness would be apparent to all, and if the cost is found, why should not he who finds the money carry out the work.

It is not suggested that all small authorities neglect their roads. Many district councils are anxious to improve their roads, but, having so many calls to meet, have not the financial ability, with the result that many district roads are not as good as they were, the allowance for maintenance not keeping pace with the traffic.

A county unit having its members drawn from a much larger area would not be influenced to the same extent by the local element, and would be better able to deal with matters on a purely business basis without fear or favour.

At present there are over

650 RURAL ROAD AUTHORITIES,

each acting on its own sweet will! Why not reduce these to sixty in rural areas, and at the same time reduce the chance of our roads becoming like a patchwork quilt?

Smaller areas cannot but feel fluctuating rates. Take a rural district council where an increased expenditure for improvements to roads of £300 would entail an increase of 6d. on the rates. What surveyor receiving a salary of £100 per annum would dare to bring such an estimate before his council even though he knew the roads badly needed the improvements, and saw that "the stitch in time would save nine"? It is feared that small authorities neglect their roads and stave off the day of reckoning as long as possible, eventually crying loudly for someone else to pay their deferred cost.

The Road Board, which was appointed in 1909, has certainly done excellent work in the short time it has been in existence. Without its grants to the trunk roads during the past few years many of them would have become impassable. But even the grants made at present by that board are not commensurate with the needs of the country, and if this is so for the county, how can the lesser areas efficiently grapple with the growing needs without even his assistance?

Under the Local Government Act of 1894 the roads that were not declared main roads were placed under the control of district councils. Latterly some of the district roads which took practically no traffic have through the advent of self-propelled vehicles become important channels of communication, and are now practically main roads. In some such cases the county council has been ready to take these roads over, but the district councils have not seen their way, in many cases owing to lack of funds, to make them up to the standard required for adoption, and they remain in a deplorable condition.

In the majority of cases this additional traffic has brought no equivalent local benefit in return for the extra money spent on the roads. The business of small local tradesmen in country districts is now swamped by the motor-van deliveries of goods from dealers in the large towns, so that they are actually the losers by the increased expense they are called upon to bear.

It would appear that most county councils are now alive to the growing needs of localities, and with the assistance and guidance of the Road Board they seem to be the natural authority for dealing with all such matters as road management.

The fact that it is recognised in the Royal Commission on Local Taxation, 1901 Report, that "The maintenance of main roads we also consider on the whole to be a national service and likely to become more so owing to the increasing mobility of the population and the development of new means of locomotion," goes far to show that the government is alive to the fact that certain charges should be eased from the direct ratepayer and the cost spread over as large an area as possible. If this is so for trunk roads, does it not point that local roads are now more than ever county charges and should be managed and paid for by a county authority? Those who have efficiently carried out a system of direct management on their main roads could without much trouble design and carry out a system for managing all roads in a county, and there is little doubt that all ratepayers would benefit by it. No doubt the carping critic, and possibly some of the well-paid and not over-worked officials, might object to such a body as their local authority being relieved of some of its duties, but common sense must show that their views are personal and narrow, rather than broad and wide as those of all efficient officers should be who have the real interest of the public at large at heart.

Public authorities are largely dependent on their expert advisers for submitting to them the most efficient and economical methods. It is therefore clear that for satisfactory administration a com-

petent and efficient staff is essential, and the contention that, should all roads be put under the jurisdiction of the county councils, a large number of district surveyors would be thrown out of work is disproved. No more false economy seems possible than in the attempt to carry on an undertaking with an inefficient staff.

The suggestion in the recent Final Report of the Departmental Committee on Local Taxation that roads should be divided into (*a*) Main roads, (*b*) county roads, (*c*) district roads, (*a*) to receive Exchequer grants of half the cost of maintenance and for future works of improvement, and (*b*) a quarter, seems amply sufficient at present.

Since the Road Board came into existence the standard of roads has, of necessity, been greatly improved, and in order to bring their roads up to the necessary high standard set up for the first two classes of roads it is feared that rural councils will receive but little relief. The report goes on to say that "in many cases substantial improvements will be necessary before roads can be properly classed as main roads," and that "the expenditure on such improvements would appear to be a substantial object for grants from the Road Improvement Fund."

The Road Board distribute their grants to a certain extent on the basis of population, and on the whole this seems a fairly reasonable arrangement, but unfortunately the Board's funds are limited. Already occasion has arisen in some counties for large sums to be spent in such improvements as the putting in of foundations and drainage and for widening. Should a council have to spend, say, £60,000 on improvements necessary to bring their roads up to the required standard, and should their share of the improvement funds be only £20,000, the burden on the ratepayers remains a very considerable one, and it is for such reason that the author suggests larger exchequer grants should be given. The proposal to put all roads under the jurisdiction of the county council may possibly seem too drastic a measure to be taken all at once, but it certainly seems advisable that the first two classes of roads, as suggested in the report, should be under county administration.

At present, as very few district councils allow their surveyors either efficient clerical assistance or efficient means of locomotion, these officials have to spend a great deal of time doing clerical work, and are unable to give proper attention to superintending the work on the roads. There is no doubt that with more clerical assistance and reasonable travelling allowances district surveyors would be better able to cope with their outdoor work.

The writer does not put forward any present county scheme as ideal for the movement, but he suggests that the county council is the best unit for efficient road management, and is convinced that when rating is placed in the hands of those who have the actual spending, rather than delegated duties, the greatest benefit to all will result, and the sound well-being of the community will be best appreciated.

Statistics are an important feature in road-making. At present there are few authorities using the same forms. It would be a great help if the Road Board were charged with the standardisation of forms, the collecting and tabulating of all statistical information, and the distribution of it to all local authorities.

It is often said that the surveyors have but to execute their duties without interfering with such matters as law and finance; but if a surveyor did so confine himself to his so-called duties, it would appear to be a sorry day for his council, and in thus suggesting a possible improvement in rural government it is hoped the writer will not be thought to be overstepping his ordinary duties.

DISCUSSION ON MR. HAWKINS' PAPER.

Mr. FRANK HARRIS (Tunbridge Wells) said, as one of the poor rural surveyors, he might inform them he had to walk there that morning, or rather had to come from the Plough. He read the paper on the way down from London, and his dander was somewhat raised. He said to himself: "Here is another county surveyor trying to boss the county, and will be trying to boss the universe directly." Fortunately, he met Mr. Hooley at breakfast that morning, and he put it in a different light. Mr. Hooley said, "You know Mr. Hawkins, don't you?" and he said, "No, I don't." Mr. Hooley then said: "He's a very decent sort of man." They went through the paper together, and he said: "I think the paper has been written in the wrong tone," and Mr. Hooley disagreed with him. Like Balaam, he came to curse, but he might stay to bless, and after hearing what Mr. Hooley had to say, he had to admit there might be something in it. This question was raised at the Roads Congress, and the opinion was expressed that that was not the place to discuss it. It was an argumentative paper. It was not a question of competition. It was a question which affected their own livelihood. It was a personal paper, and to rise to question it that was the proper place to discuss it; and yet, in his own mind, he knew of no other place where it could be better done. On the question of contributing the roads, he admitted that the county surveyor could do this, as he had very little to do. He, however, disagreed with Mr. Hawkins when he said that those rich rural surveyors had very little work to do. He did not know any highway surveyor, whether in a rich or poor district, who had not plenty to do. If he was not actually at work he was trying to find out something to meet the present conditions. If there was to be county control, the county would have to finance the business. That he looked upon as a step in the right direction. He knew rural districts in Kent, and probably they were as rich there as any other part of the country; and, by the way, the rural surveyors were petitioning the county council for assistance for roads. A surveyor said to him the other day that a motor 'bus service of fifty 'buses a day had been inaugurated along 3 miles of one of his roads, and a penny rate brought in £160. They would understand how far a penny rate would go on those 3 miles with £160. The expenditure on that road was prohibitive, so far as the district was concerned. That made him think there was something in the county council taking over and financing the maintenance of rural district roads. He appreciated that Mr. Hawkins was not antagonistic to the rural surveyor. He had been brought into contact with a good many county surveyors, and found them all very reasonable men. The rural men had got the feeling that they did want to gobble them up. He appreciated what Mr. Hawkins had said that he had no such intention. There was no finality in this meeting on this question. He would like to see this further discussed, and, if possible, some scheme adopted. Mr. Hawkins' paper was a general one, and there was no scheme in it at all, and he did not know what would be done with it, whether it would go to the council of the institution or to the Road Board.

Mr. H. J. CLARSON (Tamworth) said that his experience of county surveyors was not on a par with the last speaker. He had had a good deal to do with the county surveyors of Warwickshire and Staffordshire. In one instance—he would not tell them which—he had always been treated in the fairest possible manner, and in the other he had not. He had under his control 200 miles of roads, a good portion of which ought to be main roads. For his part, he thought it would be a good thing if some of the up-to-date rural authorities were to gobble up some of the antiquated county roads. His roads were in a far better condition than the roads of the county surveyor whose name he had not mentioned. Those roads, notwithstanding that they were in a better condition, cost less than one-fifth of the county roads, though in fairness he must say that in some instances they were not so wide. Recently a good deal of 'bus traffic had been largely diverted from the main county roads to his roads, and he did not like that, because it meant an increase in the cost of his roads. He did think if they got that friendly feeling extended to them which he got extended by that one county surveyor, they would be able to work more amicably, and the work would be carried on better than it was, not only to the advantage of the rural surveyor, but to the community at large. He had a road which was within 50 yds. of four county boundaries. He drove over there the other day, and he found four county rollers and his own roller at work within a space of half a mile. If that tended to economy he did not know what it was. If the four county councils had conferred together and hired his roller, he should have been pleased to let it at a considerable profit, and the work would have been done as well and certainly more economically.

Mr. MONTAGU HARRIS (County Councils Association) raised the question whether this was the proper place to discuss the points which Mr. Hawkins put forward, but he would venture to hope that either

as this. For that reason he hoped the views would

know what proportion of mileage was going to be included in one class or another. They would soon have the provisions of classification, and then have some guidance as to the amount of mileage under the two heads. As to the type of the authorities responsible for these different classes of roads and the improvement in administration it was necessary to introduce, he thought the sooner the authorities could know the views of their responsible officers and experts the better it would be for them, and the better it would be for the Government, so that they should be informed in good time before the Bill was introduced the views of the parties concerned in administration.

Mr. T. N. W. Watts (Marlow Urban) asked whether Mr. Hawkins intended his remarks to apply to the small urban districts which were not municipal boroughs, but as representing one of the small districts. He thought one of the dangers in such a suggestion as Mr. Hawkins had made was that it would be very difficult for small districts to obtain preferential treatment for the roads in their area. He would mention one matter—take snow removal. It was difficult to get the county council to allow anything for the removal of snow. If the urban areas were to be treated in the same way as the rural areas, the blocking of the streets in the case of a snowfall was a serious matter. If the county councils took complete charge of rural districts, difficulties might arise unless the urban districts could have extra labour expended on them in proportion to the extra traffic on the roads.

Mr. R. Oakden (Newark) remarked that one of the difficulties they had to face was that the areas of the different authorities followed the old boundaries, which was so stupid. He had a district which went between the river Trent and the county boundary, and he had to go in and out and chop through the county to get to his own roads. If the districts could be arranged apart from the old boundaries it would be better for management.

Mr. F. H. Berryman (Somerset County Council) remarked that one point he would like to make in continuation of what Mr. Montagu Harris said. That meeting, he took it, was largely composed of professional gentlemen in the employment of the various administration authorities, and for that reason it was possible that it was not altogether desirable to discuss policy, or the desirability of policy of any very great change in administration from that point of view, but he thought it would be of the greatest service to those who would be concerned in considering the question if they could have an expression of opinion as to improvements which would occur in the change from an engineering point of view—that was, improvements not only in rural districts, but in urban districts. Anyone who had considered the question would see the great difficulties which arose in urban districts. If gentlemen would give their views it would be of the greatest service on this point.

Mr. F. Weeber (Horncastle) said it appeared to him that the writer of the paper was forgetting one thing when he suggested that the county authority should become the paramount factor in regard to the roads so that they would have equal control of roads all over the county. That was not so. He had in his mind one county which was divided into three county areas, and three county councils dividing the road policy of that county. The road

as any councils could be. They actually abutted on

Mr. E. P. Hooley (Nottinghamshire) believed that Mr. Hawkins was trying hard to solve one of the most difficult problems which had arisen in modern times in connection with road work. He knew that his friend Hawkins' chief idea had been not to injure or hurt any rural or urban surveyor, but to do his best to assist them in what they were trying to do for themselves. He believed that the change was coming about. Through the advent of the Road Board they had an opportunity of changing the whole system of local administration in England, and he believed that the time had arrived when that should be done, and it could not be better done than by taking the largest unit available. Mr. Weeber had given the case away when he said he knew one county where there were three councils, and they could tell when they passed from the roads of one council to the other; but he did not multiply that by 50 and say what would be the condition with sixty different authorities. He was glad to say that his day of anxiety as to his own position was more or less over. But he could sympathetically feel for those who had to face difficulties. They knew what rural councils meant. They knew the position of the rural surveyor, who was very much like a toad under a harrow, and who could not say what he thought because of the men on his council. He knew a man in the county he was serving who was going through misery, but, happily, he was coming through. He believed those difficulties could be wiped out if a man had a bigger and wiser, and more respectable council to deal with. He did not think the rural area, because it was a rural area, was a good unit for road management. He did not think any mileage arrangement could settle what was a good area. But if the mileage area was combined with tons of material used on the road, that might be a suitable area. He had been one who from the earliest days felt that the proper thing was to have the roads managed by the county councils. When they saw not only rural councils, but the smaller urban authorities, who had quickly developing districts, and a surveyor who was paid £40 a year to manage a district of 7,000 people, it was time they asserted themselves and said this sort of thing must not continue. They had heard from Mr. Montagu Harris that the County Councils' Association was prepared to back up any sensible suggestion, and he thought they might trust themselves to think that the County Councils Association would do nothing to hurt them. If they threw in their lot with the County Councils Association they would do much to solve this road question. If they were to continue as they were they would go from bad to worse. It was only those who had to deal with rapidly developing districts who knew what it was they had to face. A man who desired by spending £500 to save £5,000 in the future could not do it because he was afraid of increasing the rate. The matter should be taken out of the hands of small councils of that kind. He knew of no better place where this matter could be dealt with than that conference. At the road conference the whole question was shelved, not by the surveyors, but by the clerks. If they discussed it as surveyors they would be helping the matter very much better than leaving it to by discussed by the clerks.

Mr. E. S. Sinnott (Gloucestershire) considered that there should be a reasonable amount of elasticity as to the classification of roads. It would be a serious matter to lay down any hard-and-fast rule as to first and second class roads. It would be much

better if all the first and second class roads were administered by the county authority, but he could name to other cases where the present system should continue. It might be argued that he was halting between two methods. He was satisfied from his experience in Gloucestershire that it was very doubtful whether very radical changes would bring about what was desired. Knowledge was now so diffused, and many rural surveyors were so competent that much work now done by them should continue to be done by them, though in every case it might be brought under county administration. But he did say that no hard-and-fast rule should be laid down, because counties varied so enormously. He was satisfied they were not ready to take up any cast-iron system.

Mr. C. F. GETTINGS (Worcestershire) dealing with the question of classification as regarded the second class roads—of which no doubt there were many in some of the more important rural districts—said there was the question of supervision and management. Undoubtedly there were a large number of cases where they could be supervised under the present system quite as well as Mr. Sinnott had said; but in other cases he did not think it would be advantageous. What he thought would be of assistance to many rural surveyors if those second class roads came more or less under the county council by way of a subsidised road, was that the rural surveyor would be able to carry out work on those roads that he would not get done through his own council. As regarded the remarks which had been made by previous speakers as to friction between county surveyors and rural surveyors, the majority of them would admit that ought not to be. There should be no reason for it. Speaking as a county surveyor, in his own county they had something like eighteen rural districts, and without exception he had the pleasure of knowing the whole of the rural surveyors, and he could get on with all of them without any trouble. The same applied to the urban districts. They did differ, but they differed in a friendly way, and he could not help but think those little differences might be overcome if there was a little elasticity on both sides. He felt rather strongly on the supervision of the second-class roads, because he knew from the recent conferences which he had had in his own county that some of the rural surveyors were very much afraid that they would not get things through which they ought to get through. If they were carried out with assistance given by the county, the county council would deal fairly with them.

Mr. J. F. HAWKINS, replying, said there was one point which he wanted to impress upon the meeting, and that was that the paper was not written in any way to bring in any friction between county surveyors and rural surveyors, and he hoped it would not be referred to in any way at all. He did not at present know any county surveyor who was at loggerheads with his district surveyors. Certainly, in his own district they were the best of friends. Whenever there was a meeting to be called there was not a vacant place; everybody turned up, and they worked in the most unanimous way. What he did feel was this. He was talking of the rural districts—not such districts as Mr. Harris represented—in which were rural surveyors who were well qualified men, and who had spent a large sum of money on their education, and who were receiving not 5 per cent on that money, in many cases it was minus per cent. It was for those men he was endeavouring to get a better position, a better tenure, and there was no doubt a county would give this better than a rural district would. Mr. Hooley had practically answered Mr. Weeber, because when he said he objected to three divisions in the county, he would ask how many divisions of a county there were. He should say forty in many counties. Mr. Clarson, of Tamworth, did not say what he asked from the two county surveyors. He might have been grasping in one case and not in the other, and that brought him to loggerheads; but he was so genial a man that he ought not to have any trouble in future.

The next paper to be submitted was the following:

THE ECONOMIES OF MODERN METHODS OF ROAD CONSTRUCTION.

By FRANCIS WOOD, M.INST.C.E.,
Borough Engineer, Fulham.

In considering the economy and efficiency of different methods of road structures for traffic of any character, we cannot do so effectively without giving attention to the supply of materials, the demand and the tendency of values. For example, the price of the granite that has been commonly used in the London area has increased by about 30 per cent. Timber for wood paving has also increased by about 20 per cent. within the past few years, and the quality has been reduced, which is an indication that the supply is not as available as in former years.

INCREASE IN COST DUE TO ECONOMIC CONDITIONS.

The tendency of prices generally is upward, principally on account of a general rise in wages, and wherever prices have not increased they will in due course do so unless some equalising factors are brought in to counteract this tendency. Therefore,

MR. FRANCIS WOOD.

it may be taken that the cost of road maintenance will increase from what may be termed a natural cause, and be quite apart from any consideration of traffic.

But there are economies to be effected by new methods of construction, and in order to discover how these economies are to be effected we must consider the waste or loss in existing methods.

The writer has, on another occasion, raised the question of the relationship of wear due to tractional resistance and wear due to internal attrition, and it is without apology that the matter is again put forward on account of its importance. Some idea is gained of the internal attrition by the tests made a few years back, which are well known to road engineers. By the mere falling of one stone upon another there was abrasion to a very appreciable extent; when moisture was added the abrasion was increased 50 and 100 per cent.

ABRASION OF MATERIALS.

These tabulated results are obviously comparative; the actual abrasion in the road cannot be obtained experimentally, but such abrasion is and must be much more severe when the stones are in contact with each other, and at the same time are undergoing the heavy pressure of traffic, and especially so when it is considered that throughout the year there is 10 to 15 per cent. of moisture in the structure, and during the winter months a much higher proportion. In order to secure some idea of the wear due to internal attrition, a record was taken of the amount of refuse collected from the streets of Fulham. Special records were made of the quantity of manure collected from the wood paved roads (no internal attrition) in 1909 and 1911. The actual surface wear of the wood paving was calculated at 350 tons per annum, and the wear on the remaining roads was estimated, being based on the wear of wood paving under proportionate traffic. The remaining quantity would be internal attrition and moisture, the latter is worked out at 15 per cent. . .

The total decrease of refuse is over 50 per cent. in the eight years, but the internal attrition has reduced by 74 per cent. . .

In 1910-11 the maximum effect of internal attrition was reached, and for the two years that followed it was increasing again. The internal attrition was

[illegible] structed in bituminous macadam, and similar [illegible] struction was not rapid enough, and, thanks to a Road Board grant, we were able to carry out three [illegible] the result that [illegible] of the road.

[illegible] represented by internal [illegible] and 12.5:14 is equal to [illegible] the wear of the macadam road [illegible] about twelve times the amount of wear in the wood-paved roads [illegible] the wear of the roads will be decreased twelve times. This, of course, is a theoretical deduction; in actual practice it would not [illegible] heavily trafficked roads, but [illegible] times the amount were taken for the [illegible] there would certainly be a very considerable [illegible] of the use of a construction in [illegible] attrition can take place.

It has been estimated that asphalt of the best [illegible] and of asphalt [illegible] by the unit 1. Similarly, macadam, well made and [illegible] has been estimated at 2.5, and when wet and [illegible] as high as 7 or 8. If an average of 4 is taken, then an asphalt surface is, so far as traffic is concerned, better than macadam in the proportion of 4 to 1. It may therefore be assumed that if asphaltic surface is laid, in which there is no internal attrition, even at the best cost, say from 4 to 8 times the cost of a macadam structure, the advantages, both from a financial and traffic point of view, will be [illegible] a macadam road. In the case under notice the matter has been gained in the manner indicated above. The bituminous road total about 2 miles, was constructed with a tarred preparation of macadam, one of which was the cause of considerable trouble for two years, owing to the tar oozing from the structure under hot summer temperatures. The remedy applied was to scarify it from end to end and sprinkle limestone dust over the material, then roll it again. It effectively stopped the complaint, but the road has not been in any sense entirely satisfactory. Three of the methods that have been prominently advocated were tried in this road, but they all had similar results. The second road was laid with a coarse understructure, on the top of which was tarred chippings; for nearly five weeks the light traffic alone caused anxiety, but gradually it set and it has been no further trouble since. A third road was laid with pitch grout (pitch, sand and cement), but here again in the hot summer months the road was so bad that the whole of it had to be taken out.

The result of these unfortunate incidents was to cause the writer to make a careful inquiry, to test the tars and compare them with bitumen. A tar mixture was made so that it should have the same degree of viscosity as the bitumen (as shown by a penetrometer at 80 deg. Fahr.). The tests of penetration at intervals of 10 deg. from 32 deg. Fahr. indicated that the tar hardened 10 deg. earlier and softened 30 deg. earlier than bitumen. There were also indications that the surface of the tar hardened very quickly on exposure. Therefore, until some method of equalising the degrees of hardening and softening under atmospheric conditions were available, it was considered inadvisable to continue its use for surface wear, especially if bitumen could be used with equal economic advantage and effect.

BITUMINOUS MACADAM.

Bituminous macadam was the result. The material for the greater part and the dimensions are the same as in an ordinary macadam road, substituting bitumen for moisture. About five miles of roads have been laid on these lines, the composition being [illegible] in depth. The cost has been at or below 4s. per super. yard, although where the traffic was considered to be "light" the thickness was reduced to 2 in. (the size of the largest stone being 1 inch), and the cost proportionately to about 3s.

DIFFICULTY OF DEALING WITH OLD MACADAM.

A difficulty arose as to what was to be done with the existing macadam in roads; the channels fixed the levels on either side, and the road had a considerable camber which must be reduced so as to give a rise of not more than about 3-10ths in. to the foot. At first the large stone was screened and used in the bituminous macadam, but there was a very large quantity of small material, and this was not considered satisfactory for use in bituminous macadam. Each ton that had to be carted away was costing about 6s., and the new material taking its place was costing 27s.; obviously, the cost of reconstruction would be considerably lower if the whole of the existing material could be used. The channels were raised as much as possible so as to reduce the quantity to be carted away, and extra gulleys were put in to assist this procedure. Eventually a trial was made of what may be termed a "tarred concrete." After a number of experiments the whole of the material, large and fine, was used, and mixed with a special mixture of tar. It was found that this made an exceedingly strong concrete costing not more than 1s. 9d. per super. yard, including heating, tarring, mixing and laying, and proved so satisfactory that a special plant was designed for the work which turns out 20 tons per day, even during the winter months when the stone and fine material is taken to the plant in a soaking wet condition. The proportion of coarse to medium and fine is in the ratio of 60 to 40 per cent. This composition will withstand any heavy load within a few hours of being laid. (Within 24 hours a traction engine and trailer, the latter having a load of six tons, was brought on to this material quite unknown to the writer, and it was surprising that only the slightest depression was noticeable.) On the top of this base is placed a thin coating 1 in. to 1½ in. thick of bituminous mixture, which cost 2s. to 2s. 6d. per super. yard laid, so that the total cost is under 4s. 6d. per super. yard. Such roads are being constantly submitted to heavy traffic, such as traction engines, steam and petrol tractors, motor 'buses, &c. &c. It is confidently anticipated that no repairs will be necessary for at least ten years.

For roads where the traffic is not so dense, and where the structure is in good condition with a reasonable foundation, other methods have been experimented with, and the results are extremely encouraging.

A modification of the above method would be to lay the tarred base, and squeegee the surface with commercial bitumen (Trinidad Lake); this costs about 4d. per super. yard, and brings the cost to under 2s. 6d. per super. yard. As soon as the bitumen is worn through, which would occur in two or three years, it would be necessary to coat it at once with the above-mentioned surface mixture, because up to the present there has not been much success with a second coat of bitumen; it fails to make a good adhesion, except when it is newly laid. It is, however, economically the best procedure to lay the bituminous mixture at once.

A method which has proved very satisfactory is to carefully grade the material from ¼ in. down to a size that will pass a 200-mesh sieve, then to add a proportion of bitumen that will just allow a tandem roller weighing 6 tons, with a weight of about 150 lb. per inch of roller width, to consolidate it without pushing the material out of position. The actual amount of bitumen used depends on the grading of the material. There is a state when the bitumen is in excess, that is when there is more bitumen than is necessary to bind the particles together effectively; this may for want of a better term be called a "mastic." There is also a state when the particles forming the composition have just sufficient bitumen to bind them effectively together; this may be termed "asphalt." But there is an intermediate position when it is neither the one nor the other, and this is the state in which the writer has found it possible to lay it on the road so that it adheres to the old macadam effectively, and is capable of being rolled as described. The old macadam road must be very dry and swept clean; consequently the mixture should only be laid in hot weather. This composition may cost about £2 per ton to manufacture, but as it is laid at the rate of 15 to 18 yds. per ton it is evident that the preparation of the surface and the laying will not involve a cost of more than 2s. 9d.

[illegible] The years where it has [illegible] is [illegible] the [illegible] and [illegible] the traffic [illegible] has [illegible] any [illegible] of [illegible]

About five years ago in another case ordinary [illegible] asphalt was laid on a road with light traffic [illegible] in the track and the [illegible] [illegible] [illegible] [illegible]

SPECIALLY PREPARED TAR.

A tar which has been specially treated to imitate [illegible] has been tested for a few months. The results although not entirely [illegible] are such as to lead one to suppose that it may be possible to produce a tar which will be a competitor with bitumen in the surfacing of roads. [illegible] [illegible] [illegible]

[illegible] years the iron-shod horses and iron-tyred wheels [illegible] ber tyres, and there is practically only tractional resistance to cause wear, the tyres will suffer more than the road.

[illegible] TO VARIOUS MIXTURES

[illegible] CONSTITUENTS

[illegible] bituminous surfacing mixture from a road, and weigh out ten grammes; then find how much carbon bisulphide is required to remove the composition to its constituent parts. In one case the writer found that the particles fell apart as the carbon bisulphide was poured on to it, whereas in a good surface mixture it takes 24 hours at least to dissolve out the bitumen. This test is by no means an absolute one for determining whether the construction is a good or bad one from a road point of view, but it is one that appeals forcibly to the writer, and indicates that the bitumen in the one case has thoroughly attached itself to the particles, whereas in the other there is merely a surface adhesion, which is easily removed.

It is hoped that the merits of natural bitumen as an agent in the construction of a road surfacing material have not been too strongly emphasised, and by that means tar deprecated for the same purpose. It would be extremely unfortunate if tar was placed in the background.

WOOD PAVING.

It is necessary to say that there are many places where wood paving would be laid in preference to bituminous paving, if its first cost were not so high. It has qualities, some of which may be said to be superior to the bituminous pavement, and where first cost is not a material disadvantage it will continue to be laid in large towns where the traffic is of a sufficient and suitable character.

GRANITE SETT PAVING.

Similarly there are areas where granite sett paving is probably of greater advantage than either wood paving or the bituminous pavement.

TARRED PAVEMENTS.

So with tarred pavements; they have their sphere, and it is advisable that they should continue to be constructed where the traffic suits the pavement. Tar is in London equivalent to £2 10s. to £3 per ton, and, having regard to the thickness of the pavement and the amount of material handled, it must be evident that there is from the writer's point of view an economy in the use of bitumen, even at double the price. In other places tar is not in so great a demand and consequently is much cheaper, and as the traffic is not so intense, it may be the case that the effect of both these factors will be to bring the cost of reconstruction to a lower rate than the writer has set forth for a bituminous pavement. Apart from this, an overwhelming demand for bitumen might cause the price to increase out of proportion to its value. Similarly if tar was found to be by adjustment, of equal value to bitumen, and the demand was severe, the price would also increase, because the daily supply of tar is not sufficient to even tar-spray the whole of the macadam roads in England and Wales during the few months of the year that this method of treating roads is carried out. It is therefore advisable that the tar and the bitumen should be used in their proper spheres, and in this manner the price will be kept at a normal and relatively steady figure.

ROAD MAINTENANCE COSTS WILL DECREASE.

It has been stated that road maintenance and road construction is likely to increase in the future. It is likely very materially to decrease under proper administration. The first cost of reconstruction is apparently increasing the costs; but if this cost of reconstruction is spread over the life of such reconstruction, instead of being added to the cost of the year's work, as is usually the case, then the maintenance costs would show the decrease that is actually occurring.

DISCUSSION OF MR. WOODS PAPER

[illegible] to the author of the paper. He would like to ask [illegible] the question arising out of this paper. In the first instance, Mr. Wood referred to his bitu[illegible] He would like to know exactly [illegible] Mr. Wood meant by that term—whether he referred to Trinidad Lake asphalt, or [illegible] any [illegible] to be had from oozing pools, or whether it was a proprietary article of any description. Mr. Wood said a method which has proved very satisfactory was to carefully grade the material [illegible] to a size that would just allow [illegible] this with a weight of about [illegible] of loose earth to consolidate it without pushing the material out of position. He would like to know whether he used anything bigger than the ¾-in. [illegible] to what was to say, whether it was all this fine material or composed of any larger particles of macadam than ¾-in. and if so, what thickness did he put that material, and whether he had any preparing material underlying it. Then Mr. Wood referred to a specially prepared tar he used. He would like to know what it consisted of, and how it was prepared, or whether it was one of the proprietary articles which were on the market at the present time. If one of the proprietary articles, he should be glad if Mr. Wood would tell them which. Then, under the heading "Life of Bituminous Surface," Mr. Wood said: "Two roads may be mentioned which have been laid sixteen years, and which had originally 1½ in. of surface mixture. There is still about ¾ in. left." Mr. Wood does not mention the names of those roads, and he should be very glad if Mr. Wood did so, as he wanted to go and see them for himself and form his own opinion upon them. He gathered further on in the paper that the bitumen which Mr. Wood referred to was Trinidad Lake bitumen. He asked him for a definite statement on that point. Mr. Wood also referred to wood paving as being even more economical than bituminous road surfaces. He did not suppose Mr. Wood could guide him where the line of demarcation came in. One must use their own judgment as to whether they should go in for wood paving or this bituminous surface, and which was likely to prove most economical in the long run.

Mr. W. J. Hadfield (Sheffield) said he should like to endorse what Mr. Wood said as to the reduced cost of the upkeep of the roads. He knew it was rather an exceptional position, and he was very glad to find that Mr. Wood had laid stress on that point in his paper. He had charge of 314 miles of roads in the city of Sheffield, and during the last sixteen years the cost of maintenance had gone down £23 per mile. The day was coming when surveyors who had been able to reduce their cost of maintenance ought to say so. Those of them who had looked out for the motor traffic and provided for it ought to emphasise that side of the question a good deal more than they did. He spoke early in the discussion so that if any of the speakers had had experience of motor 'bus traffic outside of London they might state what effect it had on their roads. For the last eighteen months they had had motor 'buses running in Sheffield. There had been 30,000 motor 'bus journeys run during the year, and he had not found the tar-macadam damaged by the 'bus traffic. He gave evidence before the House of Commons a fortnight ago to the same effect, and from the correspondence which he had had since, the statement had caused a good deal of surprise.

The Chairman: What tar-macadam is it?

Mr. Hadfield: It is slag tar-macadam laid on the old macadam surface. It is laid in three layers—the bottom 2½ in., the middle 1½ in., and the top ½ in., well sprinkled with chippings for the benefit of the horse traffic. The thickness will be 3½ to 4 in. consolidated.

The Chairman: What is the thickness of the whole bed?

Mr. Hadfield: 3½in. to 4 in. of tar-macadam, with the old road bed underneath. That would be 3 in. to 4 in., and in some cases 6 in. to 8 in.

The Chairman: Is it mixed by the corporation in their own yard?

Mr. Hadfield: Yes; it is local slag which we get in the neighbourhood.

A Member: What is the width of the road?

Mr. Hadfield: The average width of the carriageway would be 18 ft. to 20 ft. of slag. The slag would cost 4s. to 4s. 6d., and the tar 3½d. to 3¾d.

Mr. T. CAINE (Westminster): What is your experience of motor traffic on a water-bound road?

Mr. HADFIELD: Unless you can keep it in repair. What I find with a water-bound road, and not unexpected, is that it is affected very quickly indeed.

The CHAIRMAN: How long has this tar-macadam road been under the motor 'bus traffic?

Mr. HADFIELD: Seven months.

The CHAIRMAN: It is quite contrary to the experience of a great many of us.

A MEMBER: Did you not describe it in your paper at Yarmouth?

Mr. HADFIELD: No, because it was only recently laid at that time.

Alderman BAINBRIDGE (Stockton-on-Tees) said they had some bad roads, some good roads, and some very good roads. In the paper Mr. Wood spoke about dampness. They had about 4 miles of tar-macadam which they were experimenting with. He believed there was no finality in this matter of roads at present. He noticed that the roads running from east to west were quicker, and were difficult to keep up on the surface. His impression of the cause of this—and he was only a layman—was that from October throughout the winter the roads running from east to west never got a particle of sun, and frost and dampness ruined the surface of the road. Could they suggest any material which would be worse than tar-macadam for a street of that description? Could they recommend anything that would be suitable and was not abnormally costly? The next thing was they had trouble with their motormen. They said that stone of 2 in. to 2½ in. on the surface was far better than chippings. They found that their roads running from east to west wore very badly in two years, and those running north to south would stand 3½ years without touching. That went to show that roads running north to south would stand twice as long as those running from east to west. It was astonishing to find that the district surveyors, and many borough surveyors, should be paid upon such a low scale, and further that they should not have their expenses paid to these meetings. He would not say that they should form a union, because they were a body of professional men, but he would say that union was strength, and if those who were in good positions would use their influence, and the others would learn not to dominate their committees, but to become associated with the most cantankerous ones, and those who cared little about the work, if they would get into contact with them, and get them to understand their position, particularly the working-class members, who had got a little power now, he was bound to say their salaries would not stand at their present unlivable position for another month.

Mr. H. PERCY BOULNOIS (Westminster) regarded this paper as a scientific addition to a number of papers they had had on modern road construction. He thought the diagrams alone were exceedingly valuable. They gave them statistics in a nutshell. It was this class of paper which he thought the institution required to have laid before them. There were one or two points he would like to ask Mr. Wood with regard to the competing pavement which he was advocating. He was not quite clear whether the cost was always about 8s. per super. yard, or whether that was the average, or whether it ranged between certain prices. His point with regard to this artificial asphalt carpeting was this—he wanted to know whether it was any better or any cheaper than the real rock asphalt in a mastic condition, highly gritted. In the year 1873 he was in Buda Pesth, and they were laying gritted asphalt on 3 in. or 4 in. of concrete. That roadway lasted twenty years, at a cost of something like 7s. per square yard. He believed that class of material gritted up to 30 per cent could be laid on 4 in. of concrete for something like 6s. per square yard. If so, he could not help thinking that rock asphalt, the real true asphalt, would make a better carpeting material than these artificial mixtures. If they could make an artificial mixture which would last as long and be cheaper, all well and good, but, personally, he believed in the natural article. With regard to wood paving, the question had already been asked when the limit came when they would use wood in preference to a bituminous surface. It was a little difficult to answer, but he did think there were many cases in towns where wood paving must be cheaper, and certainly was better in many ways to lay than these bituminous mixtures. There was room for both. There was also room for sett paving. The manner of laying granite setts now was very much altered to what it used to be. They were now properly dressed and laid choc-a-block; there was no rumbling noise over them. They had only to look at Oxford-street—at the bottom of Tottenham Court-road—where they could see a remarkably fine example of granite paving. Each case must be dealt with on its own merits. There was room for wood, for setts, for asphalt, for artificial asphalt, for tar-macadam; but there was no room left for the water-bound macadam road.

Mr. J. S. BRODIE (Blackpool) joined in the vote of thanks to the author. Mr. Wood, and corroborated his experience as to the reduced cost of upkeep of roads. Roughly speaking, in Blackpool during the last fifteen years the roads had been very nearly doubled in length, and certainly the traffic had largely increased. He had not the statistics with him of the cost of his roads, but he thought he might say without contradiction that while the area of the roads and the traffic had very largely increased, as a matter of fact the cost of the upkeep of his roads was very little increased on what it was fifteen years ago. That showed the lasting power of the roads to be better than they were before. He attributed that to one or two special reasons. First of all, it had been the policy of most of them during that fourteen or fifteen years to put in much better foundations to their roads. That was the chief source of the economical use of the roads. If they started with a bad foundation, they might put the best crust they liked on the road, but that road would sooner or later be a failure. Then the second cause of economy was that most of them were putting down every road which had heavy traffic to carry with an impervious crust of some kind; it might be tar-macadam or bituminous material, or wood, hard or soft, or granite setts laid close-jointed, but the nett upshot of it was that the roads now were practically impervious. That seemed to be the great reason why the roads had larger wearing powers than before. The reasons he had given—because he was perfectly sure they had more traffic on their roads than ever they had—seemed to be the only reason why, with the increase of population and the use of the roads, they found the cost of the road maintenance was not seriously increasing. It had always seemed to him an explanation of the complaint they heard at every meeting of surveyors as to why the rural districts found their road expenses going up. In nine cases out of ten the roads in rural districts had very poor foundations, or no foundation at all; consequently when the increased traffic came over those roads they wore away very rapidly, and the cost of maintenance went up by leaps and bounds. He thought the explanations he had offered to them were the real cause—better foundations, impervious crusts. These seemed to him the two leading things, which enabled them, notwithstanding the greatly increased traffic, to keep their road bills down a great deal more than otherwise they would have done.

Mr. W. H. GRIEVES (Sutton, Surrey) believed Mr. Wood was on the right lines in the methods he had adopted, and was proposing to adopt still further. He did this with the more confidence, because he had had during the last two or three years some experience of a like nature in his own district. Over eighteen months ago they laid down on the London and Brighton road a bituminous mixture laid with a carpeting ¾ in. thick of bitumen. That up to the present time, although it had had heavy traffic upon it, did not appear to be disturbed in the very least. He did not quite know whether Mr. Wood's suggestion was to mix with the bitumen a local material. For two years they laid on the same road—a road in the middle of the High-street of Sutton—a carpeting on the top of an existing water-bound macadam road; that carpeting was laid with a proprietary article known as Mexphalte. He did not think there was much difference in that material, which came ready mixed, and the material which Mr. Wood proposed to lay. The very heavy traffic which they had in Sutton did not appear to have disturbed that road in the least bit. On the other hand, the vibration which was so badly felt in the adjoining shop property under the old conditions had entirely disappeared. So satisfied was he of that method of construction of laying a carpeting on the top of an ordinary macadam road that his own council had accepted the suggestion he made to them to purchase machinery for the purpose of making material such as Mr. Wood suggested in the paper. He was proposing to put 1½ in. thick of bitumen,

[illegible] and a fillip as a carpet in the roads. He could not understand the cost of that material [illegible] and the cost of carpeting, and he [illegible] that it could not be done to-day under the present conditions for less than 6s. per yard. He had given sq. yds. of road he wanted to do with that material, and in the difference of cost of putting that material down [illegible] he could be entrusted for several years to come with a considerable [illegible] and had stood the traffic very well indeed. That cost 3s. per square yard. He thought there was a future in the method of carpeting existing roads. He thought they would not only save a very large amount of money in expenditure on making roads, but they would also save a large amount in the maintenance and upkeep of those roads.

Mr. F. W. Lokes (Ewell) asked what kind of foundation Mr. Grieves had underneath the road on which he was laying a carpet.

Mr. Bryant: What does it cost to prepare a road before laying the carpeting down?

Mr. Grieves: About 9d. a yard.

A Member: Another item I should like to know in all these cases is the cost of labour. Where you pay 8d. instead of 6d. an hour for labour it makes a big difference in the cost.

Mr. T. W. A. Hayward (Battersea) said the figures of Mr. Wood in regard to scavenging were most convincing. The reduction which Mr. Wood had given in the cost of scavenging with impervious materials practically tallied with his. His scavenging cost to-day was less than one-half what it was ten years ago, and the amount they saved in scavenging was being applied to the better surfacing of the roadways. He used to be, and was still, a great believer in tar-macadam. It was a material which had served its purpose well; but the difficulty was that to-day everybody thought the same, and so there was difficulty in obtaining a good tarred material, and they had to turn their attention to other materials. He had been turning his attention to the methods adopted by Mr. Wood. They were very grateful to Mr. Wood for giving them this paper, bearing in mind the fact that Mr. Wood had only recently joined the institution.

Mr. E. Worrall (Stretford) said the particulars of their extended experiments in Stretford with rock asphalt had been published fully in the volume of their "Proceedings." They had experimented on a very extensive scale, and had this year completed £100,000 worth of work of that character. The difficulty of his council was common to that of all others when facing the problem of the growing traffic on the roads. He was instructed to construct a number of roads in tar-paving, and found it was not a success in the Manchester district. His council were good enough to instruct him to visit most of Germany and France to see what was being done there, and to visit the Limmer asphalt works. As a result of his visit he was in a position to advise his council to put down an experimental street, and that street was in the main in as good a condition to-day as when left by the contractor ten years ago. The cost then was somewhat excessive, because it was practically a monopoly; but since then local contractors had been trained and equipped themselves with plant, with the result that they were able to lay this type of pavement with 1½ in. of asphalt on 6 in. of concrete at 8s. per yard, and paths of 1 in. and 3 in. at 4s. to 4s. 6d. per yard. They got [illegible] of pavement a loan for a period of fifteen years, and for private street works they allowed seven years. At the end of fifteen years the cost would be 6d. per yard, which should be a factor in deciding between the present roads or the provision of better roads. The rock asphalt was composed of natural Limmer rock asphalt as quarried, which contained 10 per cent of natural bitumen. This was melted down and bitumen added to bring it up to 15 per cent of bitumen. The asphalt was used in the works to the proportion of 80 per cent to which 10 per cent of dry, screened Dalbeattie ⅜-in. granite chippings was added, the remaining 3½ per cent being natural bitumen and other foreign matter. This was floated on the concrete, and then sprinkled with Dalbeattie granite dust, after which it was allowed to set before the road was used. His council was so satisfied with this that they now laid no other pavement. They had also experienced that the public appetite grows with what it feeds on, and the council having [illegible] the streets paved with the material, the public were now clamouring for their streets to be paved, and they found that the cost of doing the work by loan was rather less than other forms of pavement. The property owners who at first strenuously opposed its adoption—there were three appeals to the Local Government Board, and they succeeded were now satisfied, as they found they could let their houses better than in the noisy sett-paved streets. That was, briefly, the experience of Stretford with streets paved with asphalt.

Mr. E. J. Stead (Somerset) asked Mr. Wood what kind of tar he used in all weathers, whether it was ordinary or refined tar. One of the difficulties they had in laying tar-macadam was the very short period of suitable weather they got for laying it. He would also like to ask whether it was satisfactory to put on a tar-macadam gang, with a good mixer, and accumulate a good supply of material so that they could lay it rapidly. They were considering the setting up of a [illegible] plant to use with limestone from the Mendip Hills.

Mr. Tebbutt (Southampton) said they were laying roads made of an aggregate of a mixture of granite with a proprietary article which they used to the extent of 5 gallons per ton of granite. The proprietary article he understood was one in which tar and bitumen were mixed together, and, judging from the several miles of bitumen macadam which they had laid in Southampton, there was a great difficulty when they had to deal with a bitumen which had to be laid down hot. The quality varied so greatly that places had to be renovated before it had been laid down six months. With a modern road, 3 in. thick coated with this proprietary article the cost came to 3s. per yard of surface. Laid on an old foundation this was a very satisfactory article. One gentleman had spoken of bitumen-surface roads at 2s. 6d. per yard, but in Southampton they were quite unable to surface the roads for less than 3s. a yard; and where they had to remake the road it had been 5s. 2d., and they could not do the same thing now for less than 6s. 2d. per yard.

Mr. S. C. Baggott (Macclesfield) asked what was the greatest gradient on which they could lay rock asphalt. They had some steep gradients in Macclesfield, and the difficulty came in fixing the limit of gradient on which it could be placed.

Mr. Worrall replied that information was given in the paper. Stretford being a flat district, they had not had to lay it on a gradient of more than 1 in 40. It would present difficulties on a steep gradient.

Mr. H. F. Gullan (Belfast) asked, with regard to the carpeting, whether it was Mr. Wood's practice to lay it in all weathers, or did he have to wait for a fine day for the existing road surface to be thoroughly dry. Mr. Hadfield's experience largely coincided with his own. The tar-macadam was laid in three layers in Belfast—the bottom layer 2 in., the intermediate layer 1 in., and a fine coating on the top 1 in. in thickness.

The Chairman: What is the nature of the material?

Mr. Gullan: Whinstone. The stone was treated just as hot as it could be held in the hand without scorching. The tar mixture was then applied. It was the practice to keep the tar-macadam in the bins a period of about three weeks. As regarded laying, the tar-macadam was laid all the year round. The only time it was found to be unsatisfactory was when they had had snow. They had had to stop the work then, there had been snow, as the snow had been found a bad thing. In times of heavy rain, it was necessary to knock off for half or three-quarters of a day. The time he particularly watched was when the sealing coat was applied.

Mr. A. J. Price (Lytham), speaking with regard to tar-macadam, said during the last two winters he had laid two lengths of tar-macadam, and had hardly ever been stopped by bad weather. If the material had been well mixed beforehand they could lay it in almost any weather, but with the sealing coat they wanted dry weather. It would then seal and

dried together. For ordinary repairs they wanted the road quite dry.

The CHAIRMAN: What is the nature of the material?

Mr. Percy Perrycoste: [illegible] road [illegible] Perrycoste was also [illegible] the heavy traffic road.

Mr. F. Wood, replying to the discussion, said he was very much obliged for the kind remarks that had been made in regard to the paper. Mr. Harper wanted to know what the material was that was used as a [illegible] Trinidad Lake Asphalt. In his experience of [illegible] he had studied this question a very great deal, and he [illegible] a few minutes [illegible] the right quality of bitumen to use in the [illegible] mixture. In making the mixture the size of the particles must be considered, and the amount of bitumen determined by the size of the particles in the mixture. None of these processes were proprietary. There were companies who, of course, wished to think that their process was proprietary, and wished to make it in a certain way, but it could be imitated, and there was no patentable process in existence. In fact, they had all been anticipated as far back as 1869. The question of laying asphalt had been raised as to whether it should be laid on an old road or on a prepared bituminous base. In making the mixtures which were laid on the surface of the road an excess percentage of bitumen was used so as to give the material resiliency which the other material had not, and they had to rely upon the foundation for. Consequently, in laying an inch on an old road, it was more in the nature of a mastic than an artificial asphalt. The roads about which Mr. Harpur had asked were Norman-road and Starpit. The specially prepared tar mentioned in the paper was merely refined tar and pitch, but every portion of it was tested before use and brought to a certain degree of viscosity. It had to pass through a penetration machine before being used in the process. Mr. Stead asked if this material could be used in the winter, and how long it was stored. As a matter of fact it was not stored more than half an hour. It was passed through a heater, coated with tar, and put on the road straightway. That was the position they had worked all through last winter, and laid 25 to 30 tons a day. Mr. Boulnois asked whether artificial asphalt was cheaper and better than mastic asphalt gritted. He suggested that the two processes were very much alike, and that artificial asphalt could be made cheaper and last equally well. Mr. Grieves suggested that his carpeting was not very different from that indicated in the paper. The kind of road on which this inch of material was placed was an ordinary macadam road, picked over until the unevenness had been removed and the contour of the road flattened. For the information of Mr. Stead, he might say that advantage was gained by mixing the material and putting direct on the road. They thus got what was known as the first adhesion of the tarred material.

The section then adjourned.

(To be continued.)

Fishguard Water Supply. Mr. Herbert Samuel, President of the Local Government Board, stated in the House of Commons on Tuesday, in reply to a question, that his attention had been drawn to the repeated reports of the local medical officer of health as to the insanitary conditions of the water supply to the towns of Fishguard and Goodwick, and that he was sending a medical inspector and an engineering inspector to investigate the local circumstances.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

In a [illegible] borough or cities, there is a great lack of skilled, well trained, roadmen throughout the country, as stated by Mr. G. H. Jack, the county surveyor of Herefordshire, in his last annual report, and [illegible] manner shall they be trained? Is it not often the policy of local authorities to engage men for road repairs, not because of their energy or skill, but merely to keep certain men on the [illegible] and when will such authorities learn that this is most [illegible]

* * * *

What is the correct answer to the following question: If motor omnibuses are to be taxed to support our roads, why should not merchant ships be taxed to support our Navy?

* * * *

Should we not congratulate Mr. Edgar Dudley on his public spirit in having erected at Oxshott workmen's cottages, costing only £150 each, and containing all the accommodation required by the class of tenant for whom he is catering? Is not Mr. Edgar Dudley one of the inspectors of the Local Government Board, and should not that department encourage him in his [illegible] and [illegible]

* * * *

How many surveyors have visited the National Physical Laboratory at Teddington, near London, and if there are not a considerable number who will be surprised to hear that they can gain a considerable amount of useful information by spending an hour or so inspecting this interesting and educational establishment?

* * * *

Is it a fact that the clay soil of a sewage farm may be improved and altered by digging house refuse into it, and how long does it take to effect this change? Is it also a fact, as is frequently stated, that the soil of the sewage farm at Wimbledon has been entirely changed by the adoption of this practice?

* * * *

How long will it take our legislators to realise that the Public Health Act of 1875 is nearly forty years old, and that many of its clauses require revision or amendment in addition to those which have already been dealt with? Is it not true also that the building by-laws of this country are founded on the experience of the Great Fire of London, and that the very strict regulations imposed thereby restrict progress?

* * * *

Should not the Southend borough engineer be congratulated on the manner in which he has dealt with the tramway question in one of his newly constructed boulevards, in which he has so arranged the tram line that it forms a pleasing feature of the road instead of the usual unsightly obstruction which the ordinary street tramway produces?

* * * *

How long will it take for engineers and surveyors to realise the anomaly of constituting themselves sole arbitrators in their specifications for works for which they are responsible? How can any man be judged as an impartial arbitrator when he becomes a party himself in nearly all the questions arising out of an arbitration? Would it not be a better check on both the engineer and the contractor if they knew that a third party would be called in to adjudicate if there was any dispute?

* * * *

Why should so many of the older members of the profession monopolise most of the time allotted for discussion at the meetings of the Institution of Municipal and County Engineers? And why are not the younger members encouraged to air their views, and "try the art of public speaking"?

* * * *

Why should district surveyors be afraid of the nationalisation of our highways, or of coming under the supervision of a central authority? Would not such a movement tend to improve the status of the district surveyor? And would not his salary be largely increased under such management, as the funds from which his salary would be paid must of necessity be less circumscribed than under the present system?

CORRESPONDENCE.

Sir, though I would persuade, I'll not constrain.
I'll have man's reason freely to his own
Concerning anything, or anybody.

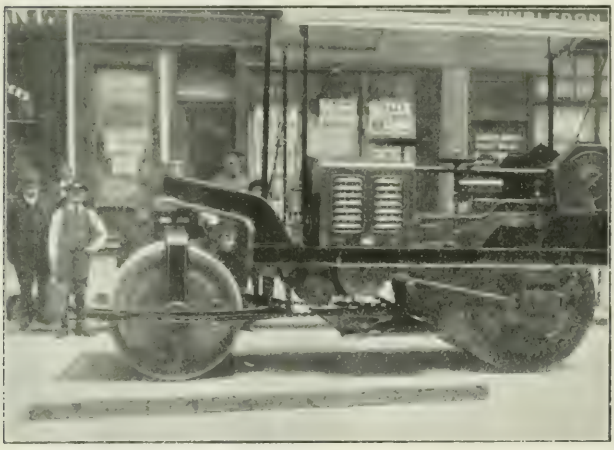
ASPHALT SURFACING OF ROADS.

To the Editor of THE SURVEYOR.

Sir,—In reading a paragraph describing an [illegible] I have applied for a patent.

In rolling asphalt applied to carriageways it is necessary to bring the roller to a standstill for the purpose of turning, as rocking the front rolls [illegible] the asphalt, and certainly on that portion of the asphalt which can least resist their weight; the consequence is that depressions are formed in the asphalt, which should have a perfectly [illegible] the corrugations found in



MR. C. H. COOPER'S METHOD OF PREVENTING DEPRESSIONS IN ASPHALT SURFACES.

most carriageways. In order to distribute the weight of the front rolls, and so avoid the formation of depressions, I place a sheet of iron on the asphalt—on this sheet the front rolls rest when the roller is brought to a standstill.

The photograph shows the roller at rest, with the front rolls on the iron sheet. A straight edge is shown so placed as to demonstrate the reduction in [illegible] that would have existed had the [illegible] been used. Yours, &c.,

C. H. COOPER,
Engineer and Surveyor.

Town Hall, Wimbledon.

"TWO SPADES AND A BUCKET."

To the Editor of THE SURVEYOR.

Sir,—In reply to "Things One Would Like to Know" in this week's SURVEYOR, it was *not* stated by "the surveyor to one of the smaller local authorities" that a 1d. rate in his district produced £3 10s. My statement was in reply to the attack made on rural councillors by the previous speaker, and I intended to show that when progressive works, such as sewage and town planning, were made a charge on the parish, and not the district, very little could be done, as the rateable value of the parish may be small. I have one parish in which a 1d. rate only produces £2 5s., and as sewage works are a parish charge, you will see that the purchase of two spades and a bucket can very easily affect the rates.

A 1d. rate in my district produces £900. Yours, &c.,

RURAL SURVEYOR.

July 6, 1914.

INDIAN AND EURASIAN STUDENTS IN ENGLAND.

To the Editor of THE SURVEYOR.

Sir,—I was very glad to see in your last issue a reply by "An Anglo-Indian Student Engineer" to [illegible] of the questions in "Things One Would Like to Know" as to why there are so many Indian and Eurasian students going up to examinations in this country?

I should only be too grateful if your correspondent would reply to my questions, which I am fully aware are conditions of a controversial nature, and I trust, now the example has been set by "An Anglo-Indian," that others may be moved to take up the points raised. Yours, &c.,

YOUR CORRESPONDENT.

July 6, 1914.

DUTIES OF THE SALFORD BOROUGH ENGINEER.

The Salford Town Council on Wednesday discussed at great length a report of the Finance Committee on the duties of the proposed new borough engineer. The report deals [illegible] with the powers and duties of the new officer, and opposition was offered by many councillors on the ground that it did not confer full powers on the official. An amendment that where the report affected the Building and Bridges Committee, the borough surveyor should only be called in at the request of the committee was rejected, and eventually the following amendment by the mayor (Alderman Lees-Jones) was passed by 19 votes against 6:—"That the report be referred back with instructions to amend the same in the direction of strengthening the borough engineer's position, by his being made, as far as practicable, the authority through whom each of the various committees shall exercise the functions appropriate to its position."

In the report of the Finance Committee it is proposed that the new borough engineer should receive a salary of £960 a year, rising by biennial increments of £100 to a maximum of £1,100.

Deal.—We have received a copy of an altogether excellent little guide which has been issued by the Corporation of Deal for the use of intending visitors to that famous town. The booklet, which is copiously illustrated by photographic views, and gives much useful information as to the history, climate, and resources of Deal, is obtainable free on post-card application to the town clerk, Mr. A. C. Brown.

Paraffin to Electricity.—The Criccieth Council held a special meeting on Monday night to discuss the question of a lighting scheme for the town, which is now lighted by paraffin oil. The council passed a resolution in favour of an electric lighting scheme at an estimated cost of £5,500, but deferred a final decision until the ratepayers have been consulted. It was stated that a gas scheme would cost £9,000.

The Proposed New Western Road.—The Select Committee of the House of Lords on Wednesday considered the Middlesex County Council Bill, a measure promoted for the purpose of securing powers to construct a new Western road. There is a clause providing that motor omnibus companies using the new road should pay the county council a sum equal to ⅜d. per car mile towards the maintenance of the road, which will extend for 5 miles, from Heston, by a junction with the Bath road, to Chiswick. The county engineer, Mr. H. T. Wakelam, M.INST.C.E., said it was estimated that 3,588,750 motor omnibuses, with a total tonnage of 21,352,500, and 16,298,162 other vehicles, with a tonnage of 15,491,877, passed over fourteen county roads in a year. Mr. Freeman, K.C., for the London omnibus owners, who object to the proposal to make them contribute to the upkeep of the road, said whereas rich people with motor-cars would use the road free, the vehicles used by poorer people would pay a high rate.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All contributions to be addressed to this page must be addressed to The Editor, St. Bride's House, 24 Bridelane, Fleetstreet, E.C. *Envelopes must be marked "Assistants' Section" in the left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

QUESTIONS.

Four weeks answers are invited to the following questions.

405. Disinfection. Sketch and describe a form of [illegible] suitable for use in a town of 30,000 inhabitants.

406. Building Construction.—Sketch a mansard roof, showing rafters, also a dormer window in an ordinary roof. (Junior.)

407. Surveying. Describe a method of setting out [illegible] by means of offsets. (M.C.E.)

409. Road Construction.—Give a specification for the construction of a macadam road to a granite setted paved road suitable for heavy commercial traffic. [illegible]

410. Removal of Sand Bar.—A certain stream [illegible] has become silted up. [illegible] its length by the formation of a [illegible] bar, [illegible] by 3 yds. What steps [illegible] to take to prevent a nuisance, and to ensure that the stream will be self-cleansing by the action [illegible] Situated [illegible]

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

404. Collapsing Strength of Pipes.—What is the collapsing pressure in lbs. per square inch of a 3-in. cast-iron pipe, 12 ft. long, and of ¼-in. thickness? Pressure on outside of pipe only. (H. V. A.)

The ultimate compressive resistance of cast-iron, [illegible] used in pipes, lies between 30 and 40 ton/in.², and if a pipe is subject to an external fluid pressure, it will follow a law similar in all respects [illegible] from within, with the difference that the material will be placed under compression in lieu of tension.

If we consider a portion of the pipe 1 in. in length, whose internal diameter is 3 in. and thickness of metal is ¼ in., the area of metal on a cross-section through a diameter will be exactly 0·5 in., and the external diameter will be 3·5 in. Therefore the ultimate resistance of the metal in crushing [illegible]

$$0{\cdot}5 \times 40 = 20 \text{ tons},$$

taking 40 ton/in.² as the crippling stress; or, say, between 15 and 20 tons, taking into consideration the lower value.

Dividing these figures by the external diameter, we get the intensity per square inch of the fluid pressure which would correspond to these values—*i.e.*—

$$15 \div 3{\cdot}5 = 4{\cdot}286 \text{ tons}$$
$$20 \div 3{\cdot}5 = 5{\cdot}712 \quad ,,$$

which is between 9,600 and 12,800 lb./in.².—E. E. W., *Stratford*.

411. Sewer or Drain.—What was the effect of the decision of the House of Lords in *Wood Green Urban District Council* v. *Joseph* as regards the meaning of the expression "single private drain" in sec. 19 of the Public Health Acts Amendment Act, 1890? (R. P.)

The construction of sec. 19 of the Act of 1890 has recently been considered by the House of Lords in the case of *Wood Green Urban District Council* v. *Joseph*, [1914] A.C. 417. In that case a pipe conveying [illegible] gardens of several houses took the drainage of those houses into a public sewer. The houses drained into that pipe in pairs, each pair discharging [illegible] by a system of pipes shaped like a Y. Three of these pairs belonged to one owner, and the others to different owners. The stems of the Ys receiving the drainage of two houses belonging to one owner were admitted to be "sewers." The question was as to whether the pipe running across the back gardens was a "single private drain." Two points arose for discussion: First, as to whether the houses were [illegible] with a public sewer" by the pipe in question, as required by sec. 19, inasmuch as their drainage passed through an admitted public sewer (the stem of the Y) before entering the pipe in question; and, second, as to whether the pipe in question was a "single private drain." On the first point, a majority of the House were of opinion that the intervention of an admitted sewer between the alleged single private drain and the houses served by it does not prevent those houses from being "connected with a public sewer" by such drain within the meaning of sec. 19. In other words, there can be a "single private drain" between two public sewers. With regard to the second point, the judgment of the House is very difficult to understand, and is based on considerations which have not been dealt with in any of the earlier cases. The pipe in question was held to be a "sewer," and not a "single private drain," on the ground that sec. 19 only applies to conduits which (in the words of Lord Atkinson) "secs. 23 and 25 (of the Act of 1875) required the owners to provide or see were provided." Now sec. 23 empowers a local authority to require the owner or occupier of a house which is not sufficiently or effectually drained to make a covered drain emptying into a sewer, or, if there is not a sewer within 100 ft., into a cesspool; and sec. 25 requires a similar drain to be provided in the case of newly-built houses, or houses which are rebuilt. It would therefore appear to follow, as a necessary result of this decision, that the local authority must show that a pipe was a conduit which secs. 23 and 25 of the Act of 1875 required the owners to provide or see was provided, in order to establish that it is a "single private drain," even if it takes the drainage of houses belonging to different owners.

LONDON ARTERIAL ROADS.

SOUTH-WESTERN AUTHORITIES' VIEWS.

The second South-western sectional conference in connection with the proposed new arterial roads in Greater London was held on Monday at the Local Government Board offices. The report of the sub-committee stated that information and the views of local authorities had been collected regarding arterial roads and town planning. The whole of the 26 authorities—out of 28—who had replied dealt with the questions relating to arterial roads; eleven of these regarded the existing roads as inadequate, nine others regarded them as adequate, but named exceptions which practically implied a negative to the question, while six considered them to be adequate. With one exception the authorities did not appear to regard the roads as adequate for expected future traffic. The opinions of the authorities were freely expressed regarding the roads proposed by the Traffic Branch of the Board of Trade. Many authorities considered these proposals generally desirable, and several, including Richmond and Twickenham, regard the proposed Chertsey road as undesirable. Several suggestions were made for widening existing roads and constructing new roads.

On the subject of town planning, twenty-one authorities were concerned with its administration, five had either obtained or applied for authority to prepare schemes, twelve had taken steps or had the matter under consideration, and one regarded it desirable that steps should be taken.

In the twenty-one areas there were 32,861 acres of land likely to be used for building purposes, and about 21,000 houses had been erected in the last ten years. There was a general consensus of opinion that main roads should be wider than required by the by-laws, and that town planning would assist in getting improved roads.

Law Notes.

Edited by J. B. REIGNIER CONDER, II., Old Jewry Chambers, E.C., Solicitor of the Supreme Court

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors, or municipal authorities. Queries should be written legibly, on one side of the paper, and must be addressed to "The Law Editor, The Surveyor, and Municipal," and accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only, and in such style as to be fit for direct reproduction, etc., without re-drawing or amendment. Unless these conditions are complied with we cannot undertake to reply to queries.

QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words as noms de plume. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

HIGHWAY SUPERVISOR. BURSTING OF HYDRAULIC MAINS. LIABILITY.—An interesting question was decided in the recent case of *Fair v. City Electricity Supply Company v. London Hydraulic Power Co.*, in the Court of Appeal, April 23rd. The plaintiff company, in the years 1912 and 1913, laid cables in certain streets under the powers given to them by Provisional Orders under the Electric Lighting Acts. The defendant company, acting under statutory powers contained in two special Acts of 1871 and 1884, laid hydraulic mains in the same streets, etc., but under the Act of 1871 and the Act of 1884. The latter Act, which is not included in the earlier Act, that nothing therein should exempt the defendant company from liability for nuisance, and it was provided that the two Acts should be read and construed as one Act. Water escaped from fractures of mains in all four of the mains, and damaged the plaintiff company's electric cables. The defendant company denied liability, and further contended that, as to the two mains laid down under the earlier Statute, the nuisance was authorised by that Act. The case was tried before Mr. Justice Scrutton, who held (1) that the defendant company, as co-licensees and co-users of the streets, had for their own profit brought into the streets a dangerous thing (viz., water at very high pressure, which, if it escaped, would do enormous damage), and which dangerous thing had escaped through the subsidence of the soil; (2) that the two special Acts must be construed together as one Act, and so that the defendant company had therefore created a nuisance for which they were liable in damages. He gave judgment for the plaintiff company, and this decision the Court of Appeal affirmed. The Court held that the doctrine laid down by the leading case of *Rylands v. Fletcher* (1868, L.R., 3 H.L., 330, applied not only to cases in which the dangerous thing escaped from the defendant's land on to the plaintiff's land, and did damage there, but also to cases (like the present) where the plaintiff occupied land by licence only, and had no right of property in the soil. The appeal was dismissed with costs.

BUILDING LINE. METROPOLIS. LONDON BUILDING ACT, 1894.—An important question as to the effect of the provisions of the London Building Act, 1894, with respect to the general line of buildings in streets was decided in *Clode and Others* v. *London County Council* (Court of Appeal). The appellants were the owners of houses on the north side of the Euston-road, which road was laid out in 1756 under an Act which provided that no buildings should be erected on new foundations within 50 ft. of the roadway. This Act was repealed by the Metropolis Management Act, 1862, sec. 75 of which provided that no buildings were to be erected beyond the general line of buildings, if the distance of that line did not exceed 50 ft. from the highway, without the consent in writing of the Metropolitan Board of Works. Before 1862 a continuous row of buildings had been erected 50 ft. back from the road. In front of these buildings, and on ground which had formed their forecourts, another row of buildings had been erected 11 ft. back from the road. In 1867 the Metropolitan Board authorised the continuance of these latter buildings, and consented to future buildings being erected up to the 11-ft. line, but no certificate was given by the superintending architect that that line was the general line of buildings. In 1909 a lessee of the appellant Clode proposed to erect a building up to the 11-ft. line, and, this being objected to, he required the council's superintending architect to define the building line. The architect defined it as 50 ft., and his certificate was confirmed by the Tribunal of Appeal, whose decision was affirmed by the Divisional Court. The Court of Appeal held that it was not competent to the council now to declare that the building line which had been authorised in 1867 by the Metropolitan Board was wrong. The appeal was therefore allowed with costs.

WATER SUPPLY. "DEVI" writes: Notice has been served on the owner of five houses, let at 3s. 9d. per week each, to provide a sufficient supply of water (sec. 62, 1875, Act). There is a local water company who by their Act (of which I have no copy) have power to levy water rates within this area. Assuming the council did the work, in default of the owner refusing to comply with the notice on the ground that the cost would be "unreasonable," the cost would be about £70. (1) would the council be able to recover the costs incurred? Kindly quote cases if any. Seeing that the water company have the monopoly (2), could they not be called upon to have, if not to bear, the whole of the cost of laying pipes to within a reasonable distance of the houses? I may add that allowing 5 per cent for the capital cost (£70), and adding the water rate, it would be equal to 6d. per week per house.

(1) The "cost" referred to in this section is the cost of the *supply* of water, and is quite distinct from the expense of bringing the supply to the premises. If the water cannot be supplied at so low a "cost" as the prescribed maximum, the council cannot require it to be provided under the section. (2) In the absence of any provision in their special Act, the company could not be compelled to contribute to those expenses.

BUILDING LINE. COMPENSATION. "Raynham" writes: (1) Are the corporation liable to pay compensation in exercising the provisions of sec. 3 of the Public Health (Buildings in Streets) Act, 1888, under sec. 308 of the Public Health Act, 1875? In answering the question I will ask you to assume that the building line is reasonable—say, not exceeding 35 ft. from the fence line, and the depth of the land is reasonably sufficient to allow it. (2) Provision is made in secs. 68, 70 and 71 of the Towns Improvement Act, 1847, to pay compensation in exercising the provisions of those sections. Does the provision apply to sec. 69?

(1) Compensation is payable under sec. 308 of the Public Health Act, 1875, only where a person sustains damage by reason of the exercise of any of the powers of that Act. It is true that the Act of 1888 is to be read as one with the Act of 1875, but it is to be observed that sec. 3 of the Act of 1888 does not confer any powers. It merely prohibits certain things being done without the consent of the urban authority. In my opinion no compensation is payable in respect of any damage sustained by a person by reason of that prohibition. (2) Compensation is payable under secs. 68 and 70, but not under secs. 69 and 71.

TOWN PLANNING. G. H. H. writes: There has arisen the question as to how the site should be measured to obtain the area so as to fix the proportion as to number of houses to the acre: (*a*) centre of streets and centre of passages regardless of all open spaces that may be in the vicinity, (*b*) the full street and passages to the plot. The builder claims that (*b*) is the correct method, because he owns the whole site, out of which the streets and passages are to be made, and that the open space (which is an adjoining recreation ground) should permit this method, as it is favourable to his case.

I am not aware of any rule or decision as to the method of measurement of an area. But I think it would be reasonable, in fixing the number of houses, to have regard (1) to the relative proportions of the ground appropriated for the purpose of streets, passages, and open spaces, and of the ground appropriated for houses; and also (2) to the existence or non-existence of neighbouring open spaces.

PRIVATE DRAIN OR PUBLIC SEWER?—"Malcolme" writes: A street or road within this district has been laid out, kerbed and channelled complete with a 9-in. drain, and proper quantity of gullies to drain the street. This drain empties into the council's sewer. There are no buildings as yet on this street. Is this drain a public sewer, and such as could be claimed to be used by any property built within 100 ft. thereof? The street is a private street.

By sec. 4 of the Public Health Act, 1875, "sewer" includes sewers and drains of every description, except (1) "drains" as defined by the section, and (2) drains vested in or under the

control of any authority having the management of roads and not being a local authority under the Act. It is clear that there may be a sewer without drains connected with it. See *Bradford* v. *Eastbourne Corporation* (1896, 2 Q.B., 205). In my opinion this is a "sewer," and unless it falls within either of the exceptions mentioned in section 13 of the Act it is vested in the council, and the owners or occupiers of premises within the district are entitled to cause their drains to empty into it, subject to the conditions prescribed by section 21.

INSTITUTION OF MUNICIPAL ENGINEERS.

NORTH-WESTERN DISTRICT MEETING AT MANCHESTER.

A two days' meeting was held at Manchester on Friday and Saturday, July 3rd and 4th, the meeting on the first day being of a social nature, and on the second consisting of a visit to works. The first item on the programme on Friday was tea at the Midland Hotel, and the following were among the members who attended this and other functions: Messrs. W. Heady (vice-president) county surveyor of Cumberland, and chairman of the Northern District of the institution; A. R. Bleazard, borough surveyor of Clitheroe, and chairman of the North-Western District of the institution; John T. Pegge, past-president of the institution, and city surveyor of Durham; John T. Shield (Blackburn), Arthur Foster (Salford), A. Dempsey (Bootle), Geo. Hayes (Westhoughton), James Sothern (Little Lever), James T. Davies (Little Hulton), G. H. Hopkinson (Chorley), Wilson Briggs (Stockport), Tom Fogg (Heywood), E. Walker (Stretford), R. J. McKenna, Hon. District Secretary, and B. Wyand, Secretary of the institution. There were also a number of visitors present. The members and their friends sat down to tea at six o'clock, and a meeting of the council was held afterwards.

At the smoking concert which followed the chair was taken by Mr. Finch. The various items were deservedly encored, and the chairman in his few words of thanks to Mr. McKenna and the artistes laid special stress upon the splendid programme that had been provided, by the kindness of Messrs. Fogg and Bleazard.

On the Saturday a visit was paid to the Ashton-under-Lyne, Stalybridge and Dukinfield waterworks, an inspection being made under the conduct of Mr. Fred. J. Dixon, F.G.S., M.INST.C.E., engineer to the Joint Water Committee, of the very modern filtration plant and other works at Bradley and Ashway Gap. At Ashway the party were kindly entertained to tea by Mr. Dixon.

NORTHERN DISTRICT.

The meeting at Alnwick was postponed from July 11th to July 18th.

COUNCIL MEETING.

At a meeting of the council held in Manchester on July 3rd the following applications were recommended for admission.

To Membership: Messrs. F. Sutcliffe, surveyor, Barrowford Urban District Council; G. Berry, engineer and surveyor, Lower Rural District Council; and H. L. Swindlehurst, shire engineer, Mulwaree Shire, Goulburn, N.S.W.

To Associate Membership: Messrs. Bernard Sharp, assistant surveyor, Skirlaugh Rural District Council; Chas. Snell, assistant surveyor, Abersychan Urban District Council; A. L. Robinson, sanitary surveyor, Cuckfield Rural District Council; and F. R. Sheriff, assistant engineer, Public Works Department, India.

Transfer to Associate Membership: Mr. B. L. Chopra, Northcote Manchester, Gloucester.

(Under the new by-laws these elections will be ratified at the next council meeting if no written objections are lodged within fourteen days.)

New Members.—Of the applicants recommended for admission at the last meeting seven members were elected, one associate member was transferred to membership, and four students were transferred to associate membership.

Architects Registration Bill.—It was decided to agree with the suggestion made by the Society of Architects that a conference of representatives of the two bodies (the society and the institution) be held, and further that the name of Mr. A. R. Bleazard should be added to any such committee.

Membership Badges.—It was decided to accept the quotation of Messrs. Fattorini & Co. for the supply of these, and to place an order for 500. These badges will be supplied to corporate members and students at one shilling each, and due notice will be given when they are ready.

The next meeting of the council will be held in London on Wednesday, July 22nd.

An invitation has been extended to the members of the Institution of Municipal Engineers to attend the municipal conference which is to be held at the Anglo-American Exposition, Shepherd's Bush, London, from July 20th to 25th, and of which Viscount Peel, the chairman of the London County Council, is the president. The mayors of the principal cities of the United States and other delegates will arrive in London in time for the opening day. The object of the conference, which has the warm sympathy and support of the Government of the United States, is to bring about an interchange of information between the governing bodies of the great municipalities of Europe and America. It is proposed that after the conference a tour should be made by the American delegates through the most important cities in the various European countries for the purpose of studying in a practical way the methods used there.

New Town Hall for Marylebone.—The Princess Royal on Wednesday laid the foundation stone of the new town hall for Marylebone, which is being erected in the Marylebone-road, at a cost of nearly £100,000.

Surrey East and West Road.—In the House of Commons on Tuesday the Financial Secretary to the Treasury was asked when it was proposed to proceed with the widening of the east and west road through Surrey, and when the construction of the part immediately west of Dorking was likely to be undertaken; was he aware that proprietors of land abutting on the road had been informed that it was desirable to postpone frontage improvements in view of the possibility of a strip of the land being required for widening; and, in order to avoid unnecessary expenditure of private and public funds, could anything be done to accelerate a decision on the subject? In reply, Mr. Montagu stated that no application in respect of the scheme in question had been submitted to the Road Board, who had no knowledge of negotiations with landowners. The board regarded the scheme, however, as one which might well be executed with their assistance in a period of trade depression.

"BITUVIA" ROAD CRUSTS.

High-road near Water Tower, Epping

Messrs. Engert & Rolfe at, among other places, Cheltenham, Wolverhampton, Watford, Epping, East Ham, Bexhill, Leicester, Letchworth and Southampton, under severe conditions, furnish the most conclusive proof of the efficacy of this form of road crust.

Without revealing the component parts of "Bituvia" we may say that specially refined and prepared Trinidad Lake bitumen forms the basis and the greater percentage; consequently, on this account it is claimed that this "binder" grout is, to all practical intents and purposes, indestructible, and that it is not influenced detrimentally by climatic conditions. Under low temperature, the material will not harden so as to become brittle, and under high temperature it possesses toughness to an extraordinary degree. There is possess the most essential conditions for genuine economy, as the work can be effectively carried out by local labour, and where obtainable, with local hard stone or with slag or screened clinker, though, naturally, for main thoroughfares in town districts granite is strongly recommended.

Knighton High-road, Woodford.

Messrs. Engert & Rolfe's No. 1 Specification provides an excellent road crust for those thoroughfares used by motor 'buses and other heavy mechanically driven vehicular traffic, and the surface would require very little, if any, attention for at least from five to

country roads.

... that, as the result of a series of trial roads, ... find that 5s. 6d. per yard super. would be a fair aver... for the No. 2 Specification.

Possibly the strongest points in favour of this system ... the facts that (a) ... voidless internal attrition is impossible; (b) that these crusts are absolutely waterproof; (c) that, owing to ... able friction and vibration. Finally, these advantages, ... per super. yard.

... yds. super. for the Woodford main roads and ...

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Axminster R.D.C. (June 25th. Mr. P. M. Crosthwaite). £1,150 for works of water supply. It was explained that the money was required chiefly for the construction of a new reservoir.

Bognor U.D.C. (June 30th. Mr. M. K. North).—£10,000 for the purchase of the Rock Garden property on the front for the provision of winter gardens. Negotiations, it was explained, were proceeding with the owners of the remaining property, and that when the purchase of this had been effected a comprehensive scheme would be submitted by the council.

Coventry T.C. (June 24th. Mr. Edgar Dudley).—£532 for the purchase of property for the widening of Narrow-lane.—The city engineer, Mr. J. E. Swindlehurst, stated that the present width of Narrow-lane at the point it was proposed to widen varied from 17 ft. to 20 ft., and it was intended to make it 40 ft.

Manchester T.C. (July 7th. Mr. H. R. Hooper). £[illegible] for the purposes of the electrical undertaking.—In the course of the proceedings the inspector found fault with the corporation for devoting

"KNIGHTON," HIGH-ROAD, WOODFORD.

... engineers, and are delighted at all times to give inquirers the best advice at their command, based ... practical experience.

Official Fire Tests.—The British Fire Prevention Committee conducted two series of fire tests last week at their Regent's Park testing station. The first of these dealt with a fibrous material suitable for partitioning and panelling, known as "Calno," which was put before the committee by the Fireproof Fibre Building Boards, Ltd. It was tested in panel form of various thicknesses, the thinner panels for duration, and the thicker ones for the committee's standard 45 minutes' test, with a view to obtaining the classification for affording "temporary protection" (Class A). The second series was with a partition and with two doors of non-flammable wood treated by the Timber Fire Proofing Co., Ltd. The partition was submitted to the committee's 45 minute test with a view to obtaining the classification for "temporary protection" (Class A), and the 2-in. doors to the one hour test with a view to obtaining the classification for "temporary protection (Class B). The temperature throughout these tests had to range from 1,500 deg. to a temperature not exceeding 1,650 deg., and ... from the steam fire-engine. The result of the tests will be submitted in the form of a report in due course. The next testing day at the Regent's Park Testing Station will be July 22nd.

a proportion of the profits of the electricity undertaking towards the relief of the rates, his chief reason being that electrical undertakings need all the money they can get to keep pace with the progress of the industry. Mr. Hooper also objected to the corporation borrowing £5,000 to supply motors for hire to customers, and suggested that they should save the interest by finding the money out of revenue instead of capital. It was stated that in the past twenty years the electricity department had contributed £179,185 towards the relief of the rates.

Sheffield T.C. (July 3rd. Major J. Stewart).—£19,832 for works of sewerage. It was stated that the cost of labour and materials had increased greatly during the last two years. Pipes had gone up 30 per cent, labour 10 per cent, and team work 10 per cent. There was no probability of labour or team work, which represented 60 per cent, coming down in the near future. The evidence showed that in 1901 the city had 110 miles of rubble sewer, but by March last this mileage had been reduced to just over 25 miles.

Sudbury T.C. (June 25th. Mr. W. M. Cross).—£1,400 for the provision of new power and pumping plant at the waterworks.—It was stated that the council expected to effect a nett saving of £46 a year by the proposed new machinery.

Tavistock R.D.C. (July 7th. Mr. H. S. Bidwell). —£900 for works of sewerage and sewage disposal at Lydford.—The medical officer of health, Dr. Brodrick, said the proposal had been under discussion for many

[illegible] it was desirable that the scheme should be carried out, although the ratepayers were unwilling [illegible] the matter to be left in abeyance, pending the result of the present trade depression.

Whitley and Monkseaton U.D.C. (July 3rd. Mr. A. W. [illegible] the Local Government Board, attended a meeting of the Council [illegible] the proposed extension of the sewerage system. The engineer, Mr. J. F. Wardle, stated that the present cost of lighting and extinguishing the lamps was £8 per annum, and that when the contractors were recalled a saving would be effected of £8 per lamp per annum, or an equivalent of £28 in addition to the saving in wages.

APPLICATIONS FOR LOANS.

Biddulph U.D.C. £800 for the purchase of property and road improvements.

Blackburn T.C. £35,200 for road improvement.

Colchester T.C. £4,[illegible] for wood paving, £1,000 for [illegible] with granite setts, and £3,110 for extensions to the isolation hospital.

Coventry T.C.—£810 for road widening.

Darlington T.C. £[illegible] for the electricity undertaking.

Durham C.C. £1,[illegible] for the purchase of a school site at Easington.

Falmouth T.C. £1,350 for paving footpaths with tar-macadam.

Gateshead T.C.—£7,428 for the extension of the secondary school.

Hinckley U.D.C. £1,065 for a new sewage pumping main.

Horwich U.D.C. £11,000 for the improvement of Chorley New road.

Hungerford R.D.C. £1,000 for workmen's dwellings.

Ludlow T.C.—£4,000 for a housing scheme.

Morley T.C. £[illegible] for works of sewerage.

Newcastle-under-Lyme T.C.—£1,000 for electrical machinery.

Oldham T.C. £[illegible] for the electricity undertaking.

St. Helens T.C.—£25,000 for a housing scheme.

West Bromwich T.C.—£4,423 for the purposes of the electricity works.

Wigan T.C.—£150 for a public convenience.

Wolstanton U.D.C.—£1,911 for works of sewerage.

Wrexham T.C. £3,025 on the electricity works.

LOANS SANCTIONED.

Barnoldswick U.D.C. £4,000 for works of water supply.

Biddulph U.D.C.—£10,301 for the purchase of the local gas undertaking and extensions of the gas-works.

Birkenhead T.C.—£865 for a school clinic.

Brampton R.D.C. £430 for works of water supply.

Chester-le-Street U.D.C.—£42,700 for the provision of workmen's dwellings.

Colne T.C.—£1,250 for electricity mains and for a booster.

Dartford U.D.C.—£1,691 for the extension of the recreation ground, and £300 for footpaths.

Ellesmere Port U.D.C.—£1,627 for the purchase of a site for workmen's houses.

Grantham T.C.—£448 for cemetery extension.

Halesowen R.D.C.—£257 for sewerage and surface-water drainage.

Haywards Heath U.D.C.—£2,300 for the purchase of a site for a cemetery.

Maidenhead T.C.—£470 for sewer extension.

Paddington B.C.—£5,524 for machinery in connection with the electricity undertaking.

Southmolton R.D.C. £800 for works of water supply.

Swansea T.C. £[illegible] for a new school.

Westminster B.C.—£2,000 for street improvement.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making this record as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below: Buildings Birmingham £30,295, Dudley Sheffield; housing and town planning Newcastle on Tyne £25,000, roads and materials Colchester £15,000, sewerage and sewage disposal Barry Port, Leek £9,700; water, gas and electricity Birmingham £7,000,000. Particulars of other projected works will be found in our Local Government Board Inquiries 1914.

BUILDINGS.

Batley T.C.—A scheme has been approved for a new police station, police court, and inspector's house, at an estimated cost of £6,300.

Belfast T.C.—The provision of additional washing baths at Templemore Avenue has been referred to the city engineer for report.

Birmingham T.C.—The Watch Committee recommend the adoption of the plans of the city engineer, Mr. H. E. Stilgoe, for the extension of the Victoria Courts, at an estimated cost of £30,295.

Cheltenham T.C.—For the conversion of five houses on the Promenade (which have been purchased for £5,500) into municipal offices, the town council on Monday accepted a tender at £5,574.

Criccieth U.D.C.—Plans are to be prepared for two shelters on the sea front.

Derby T.C.—The council have agreed to a recommendation for the consideration of a scheme involving the conversion of the Spot.

Dudley T.C.—The town council have decided to invite competitive designs from qualified architects within 150 miles of the borough for a new town hall, municipal buildings, and police-station. The buildings are to be erected in connection with a scheme extending over a number of years, owing to the site being now occupied in part by smaller buildings. The work will probably be proceeded with in the following order: Police buildings, municipal buildings, and town hall. Designs, however, will be invited for the whole scheme. All the main frontages will be in Priory-street.

Dundee T.C.—A new sub-station for electricity purposes is to be built in Walton-street, at an estimated cost of £6,500.

Norfolk C.C.—The contributions promised from other sources having amounted to the sum of £1,200, the council have undertaken to rebuild Ludham Bridge.

Paddington B.C.—The Baths and Washhouses Committee have recommended that instead of thirty-two Russian baths, provided for the Porchester-road establishment, only sixteen such baths should be provided, and that Turkish baths for twenty persons should be substituted, at an estimated cost of £1,800 over the original estimate.

Sheffield T.C.—The Improvements Committee recommend the expenditure of a supplementary sum of £11,553 in connection with the town hall extension scheme.

Stepney B.C.—It has been agreed to make a contribution of £1,800 towards the London County Council scheme for the widening of Gunmakers' Arms bridge, provided the London County Council carry out the work upon the general lines of the plan prepared by the borough engineer, Mr. M. W. Jameson.

Sunderland T.C.—Investigation has shown that the Wearmouth Bridge, which connects Sunderland and Monkwearmouth, has been damaged through the mining operations. In view of this damage, and of the fact that the bridge is too narrow for the traffic, the Bridge and Ferries Committee recommend that estimates and plans be prepared for a new bridge. The mining company have agreed to pay a substantial sum in respect of damage to the existing bridge.

West Hartlepool T.C.—The Health Committee recommend the town council to build a sanatorium for consumptives. With fifty beds and six shelters, the capital outlay, including furnishing, is estimated at £6,150, of which the Government, it is expected, would grant about three-fifths, leaving £2,475 to be provided locally.

Willesden U.D.C.—The Works and Open Spaces Committee have been asked to report on the advisability of providing an open-air swimming bath on the Shoulbridge recreation ground.

HOUSING AND TOWN PLANNING.

Batley T.C.—The Housing Committee have been asked to prepare a housing scheme, with plans and estimates.

Cardiff T.C.—Tenders are to be obtained for the erection of 144 houses at Pontcanna-road.

Chester-le-Street R.D.C.—A scheme has been adopted for the erection of 100 cottage dwellings at Harraton.

Kingswood U.D.C.—A committee has been formed to make inquiries as to a suitable site for and the cost of erecting a number of workmen's dwellings.

Liverpool T.C.—The twenty-second housing scheme of the corporation—the latest instalment of a movement which has already cost nearly £1,200,000—situated in a district between St. Anne-street and Christian-street, was formally inaugurated last week. Insanitary dwellings numbering 124, containing a population of 563, have given way to seventy-eight new dwellings for 406 persons. The buildings were designed by Mr. Turton, surveyor to the Housing Committee.

Ludlow T.C.—The council have approved the plans of a housing scheme prepared by the council surveyor, Mr. W. G. Lane, and estimated to cost £1,000.

Newcastle-on-Tyne T.C.—The Housing Committee have approved schemes for building 138 workmen's dwellings, at an estimated cost of £25,000. The houses are to be erected in St. Lawrence-square and Walker-road. In Lawrence-square the scheme provides for eighty-four two-roomed dwellings at 4s. 9d. per week, and twenty-eight three-roomed dwellings at 6s. 3d. per week. The total number of dwellings is 112, containing 252 rooms. The amended Walker-road scheme provides for eight two-roomed dwellings at 5s. a week, eight three-roomed dwellings at 7s. 8d. per week, the total number being sixteen, containing forty rooms.

Newport (Mon.) T.C.—In addition to recommending that another housing inspector be appointed, the Housing Committee have instructed the borough architect to submit reports on housing schemes alongside Llwerry-road and near Downing-street, together with the Somerton estate scheme.

Stamford T.C.—After having been rejected, a proposal for the erection of twenty-four workmen's dwellings, at an estimated cost of £1,000, was passed recently by the council, consequent upon a petition sent to the Local Government Board by 400 citizens.

Westminster B.C.—Negotiations have been opened with a view to the erection of workmen's dwellings in Poland street.

PARKS AND OPEN SPACES.

Leeds T.C.—Municipal golf links are to be laid out at Roundhay Park at an estimated cost of £200.

Rothes T.C.—It has been decided to acquire a lease of the park in Spey-street, adjoining the Great North of Scotland Railway, and extending to 5 acres, with the object of laying it out as a recreation ground for the inhabitants.

REFUSE COLLECTION AND DISPOSAL.

Cork T.C.—The question of a site for the disposal of refuse has been referred to the consideration of the city engineer, the medical superintendent of health, and the law adviser.

Stockton T.C.—Extensions to the refuse destructor have been completed at a cost of £961, £98 below the estimate.

ROADS AND MATERIALS.

Colchester T.C.—The Road Board have sanctioned a scheme for the reconstruction of the scheduled main roads with bituminous macadam, at an estimated cost of £15,000.

Derby T.C. [illegible]

Foleshill R.D.C. [illegible]

Leicester T.C.—An improvement is to be carried out [illegible]

Morley T.C.—The West Riding County Council have [illegible] Bridge-street.

Newcastle (Ireland) U.D.C.—The tender of Mr. [illegible] at £360 has been accepted [illegible]

Norfolk C.C.—The county surveyor, Mr. T. H. B. Heslop, in a report submitted to the council on Saturday last, states that the total cost per mile for ordinary road maintenance, including all items (except improvements, road tarring, flood damage, and Road Board work), such as management, steam rolling, tools, stationery, and also repairs to footpaths, was £51 7s. 2d. With the very great increase in motor traffic, and also in traffic of a heavy character, it was inevitable that there must be a considerable increase in expenditure if the roads are to be kept in a reasonable state of efficiency. The whole of the more important main roads should be coated with granite or some more permanent material, the local materials now used being quite unsuited to present-day traffic. Surface tarring in the principal towns and villages has again been carried out to the evident satisfaction of the public. One hundred miles of road were treated, as against 91¾ miles in 1912. One hundred and seventeen miles of road were being tarred this season. In addition to this the whole of the 17 miles of roads reconstructed under the 1911-12 Road Board grant would again be retarred in 1914, a considerable portion of the cost being paid by the Road Board.

Paddington B.C.—The borough surveyor, Mr. E. B. B. Newton, has been instructed to fix five temporary street refuges, in order to give an opportunity of judging of their utility.—The tender of Messrs. W. W. Howard, Bros., & Co. has been accepted for wood-paving blocks, and the tender of Mr. H. J. Green- [illegible] sand, and gravel.

Penge U.D.C.—The surveyor, Mr. H. W. Longdin, has [illegible] pipes, the estimate for [illegible]

Perthshire C.C.—The Blairgowrie District Committee have agreed to carry out the road improvement scheme sanctioned by the Road Board at a cost of £3,000, and the road surveyor has been instructed to prepare a further scheme, under which an expenditure of £25,000 will be incurred, the disbursements to be spread over a number of years.—The West Perthshire District Committee have received an intimation that the Road Board have approved of the scheme for the construction of about 25 miles of roads in the Killin district at a cost per mile of about £450. The board will give a grant of £9,000 and lend the District Committee £2,000, free of interest, repayable in four annual instalments.

Stepney B.C.—Acting upon a report by the borough engineer, Mr. M. W. Jameson, the council have approved of an amended plan, proposed by the London County Council, for the widening of Commercial-road to 70 ft., at an estimated cost of £24,000.

Stockton T.C.—The borough engineer, Mr. M. H. Sykes, has received instructions to prepare plans for [illegible] proposed new roads.

West Riding C.C.—In accordance with the suggestion of the Road Board the Highways Committee propose to arrange conferences with the highway authorities in the Riding, and also with the county councils of adjoining counties, with a view to co-ordination of the proposals to be submitted to the board on the subject of road classification. The records of traffic will be taken during the months of July, August, and September. The Road Board state that, in view of the object of the proposed classification, highway authorities must bear any costs incurred in connection with the traffic census and the preparation of proposals for classification, and the committee recommend that the county council should bear the expense—estimated at £1,550—of taking records on main roads at points approved by them.

Worthing T.C. [illegible] to be paid [illegible] with [illegible] the Public [illegible] Works [illegible] Loans [illegible]

SEWERAGE AND SEWAGE DISPOSAL.

Alcester R.D.C.—With respect to Mr. Woodhouse's sewerage [illegible] Mr. Woodhouse stating that he would be willing [illegible] have a piece of land rent free for the erection of a filter bed, subject to the plans being approved by his surveyor. The council have decided to ask Mr. Woodhouse's surveyor to prepare plans that would be satisfactory to him, and submit them to the sanitary [illegible]

Brampton R.D.C.—The Local Government Board have advised the council that they are prepared to sanction the proposed sewerage scheme for Castle-carrock, at an estimated cost of £1,260, but that if the council are of opinion that an equally satisfactory scheme could be devised at a less cost, the board would be prepared to consider it.

Burry Port U.D.C.—The council have instructed Mr. A. P. I. Cotterell, M.INST.C.E., of Westminster, to prepare a scheme of sewerage and sewage disposal for their district.

Clones U.D.C.—Sanction is being sought for a [illegible] £2,700.

Hebden Bridge U.D.C.—Messrs. J. Newton, Son & [illegible], Manchester, have prepared plans for the [illegible] of the sewage disposal works [illegible] at £2,000.

Ipswich T.C.—Subject to sanction being obtained to a loan, the council have agreed to purchase a motor boat for the removal of sludge.

Leek R.D.C.—A decision has been reached to pro- [illegible] with the Endon sewage disposal [illegible] estimated cost of £6,700.

WATER, GAS, AND ELECTRICITY.

Birmingham T.C. The Water Committee recommend the council to authorise the construction of a third pipe line from the Elan Valley to Frankley reservoir at an estimated cost of £700,000. The committee recommend that the work be entrusted to Mr. F. W. Macaulay, at present the Elan supply resident engineer. Mr. Macaulay has been associated with the department since 1892, and they feel that the responsible work involved in the extension of the Elan scheme may be safely entrusted to him. They recommend that he be now appointed the Elan supply engineer, thus making him responsible not only for the administration of existing works, but for advising the committee as to future requirements, and designing and carrying out any additional work. On his appointment to this new office the committee recommend that Mr. Macaulay's salary be increased from £1,000 to £1,200 per annum. They also feel that it will be necessary to provide Mr. Macaulay with a fully-qualified assistant, and in view of the temporary character of the appointment they recommend that the salary of the assistant engineer should not be less than £600 per annum. The committee also recommend the construction of a balancing reservoir at Highter's Heath, Yardley Wood. The design for the reservoir has been prepared by the local engineer, Mr. William Gray, and approved by them. The dimensions are 344 ft. by 190 ft., with a water depth of 10 ft., and a total capacity of 4,000,000 gallons. The estimated cost, including the provision of a keeper's cottage and fencing, is £17,142, and the committee recommend the council to authorise them to advertise for tenders for carrying out the work. The main required to connect the new reservoir with the distribution system comprises a length of 2,928 yds. of 30-in. cast-iron pipes, the estimated cost of which is £10,912, and this work will be put in hand concurrently with the construction of the reservoir.

Brampton R.D.C.—The council have instructed Messrs. Taylor & Wallin, of Newcastle-upon-Tyne and London, to prepare a scheme for and report fully upon the water supply of the parish of Cum Whitton. The water will probably be obtained from copious springs on the fells, and several miles of mains are likely to be required. This is the fifth scheme which the Brampton council have intrusted to Messrs. Taylor & Wallin.

Dewsbury T.C.—A report with respect to the new lavatories and aeration plant has been presented by the committee of the Baths and Markets Committee, and the baths superintendent (Mr. T. Folson), in which it is stated:—During the year we had deputations from Glasgow, Doncaster, Stalybridge, and Batley to visit our baths, all of whom were surprised with what they saw and quite satisfied with what had been accomplished. Two samples of water were taken by the medical officer (Dr. Halliwell), one in October last and the other in January, 1914, and they were sent to the county bacteriologist, and his reports were quite satisfactory, the water being stated to be highly suitable for bathing purposes. Considering the fact that the water had been repeatedly used, the examination shows a very considerable degree of purification."

Dunfermline T.C.—The council are seeking powers [illegible] necessary land for the purpose of increasing the water supply to the Rosyth area.

Eastbourne T.C.—A satisfactory report with respect to the electricity undertaking was submitted on Monday by Alderman Martin, chairman of the Electricity and Street Lighting Committee. The corporation, it was stated, purchased the property in 1899 for a high price, and they thought at first they had made rather a bad bargain, because the outfit was practically obsolete. Since then, however, they had renewed a great deal of the machinery, and they had also been reducing the cost of the light to the consumers by one-third, and the cost of manufacture something like 35 to 40 per cent. The nett profit for the year, after repayment of loans, amounted to £2,696, against £2,495 last year, while the reserve and renewal fund had reached £23,400.

Howden R.D.C.—The council on Saturday adopted the recommendation of Mr. Percy Griffith, M.INST.C.E., that a 12-in. diameter boring, lined with steel tubes, be made to a depth not exceeding 70 ft.; to insert a test pump therein, and if water is obtained to carry out a continuous test for twenty-one days at the rate of at least 5,000 gallons per hour.

Oswestry T.C.—The cost of the scheme to improve the borough water supply has amounted to £140 less than their original estimate, and the quantity of water brought to the town reservoirs has been doubled, notwithstanding an extremely dry season.

MISCELLANEOUS.

Cirencester U.D.C.—It has been decided to purchase from Messrs. Thornycroft & Co., at £562, a 2-ton motor vehicle for hauling purposes, with interchangeable bodies, including a 400-gallon tank, and adaptable for street watering.

Preston T.C.—It has been agreed to purchase two motor fire engines, one from Leyland Motors, Limited, and one from Merryweather's, Limited, at a cost of £1,200 each.

Torquay T.C.—The borough surveyor, Mr. H. A. Gaskell, on Tuesday reported that the price per horse [illegible] and after July 1st would be increased by 1s. 1d. per week, or an increase of from £200 to £300 per annum in his wages bill, which, added to the recently increased wages to labourers, masons, and [illegible], and another advance to the labourers on January 1st next, would affect his wages bill to the extent of £400 to £600 a year. In view of the reduction in the amount allocated to the committees in his department, the estimates were bound to be exceeded.

Willesden U.D.C.—The council have accepted the tender of Leyland Motors, Limited, at £760, for the supply of a petrol motor lorry, constructed in accordance with the requirements of the War Office, thus carrying certain subsidies.

FOR OTHER ADVERTISEMENTS

See End of Paper.

FROME URBAN DISTRICT COUNCIL.

WATERWORKS.

SUCTION GAS PLANT, GAS ENGINE, AND VERTICAL THREE-THROW RAM PUMPS.

An additional clause to the advertisement which appears under the above headings on p. xviii. of this issue stipulates that applications for Form of Tender, &c., must be accompanied by a cheque for £2 2s., which will be returned upon the receipt of a *bonâ-fide* Tender and all other documents. (1,772)

HOWDEN RURAL DISTRICT COUNCIL. EAST YORKSHIRE.

TRIAL BORING AT SOUTH NEWBALD.

The Council are prepared to receive Tenders for the Construction of a 12-in Trial Boring in the Parish of South Newbald, in the East Riding of Yorkshire, and for testing the yield of water therefrom. Copies of the Specification and Form of Tender can be obtained from the Council's Engineer, Mr. Percy Griffith, M.INST.C.E., F.G.S., 20 Victoria-street, Westminster, S.W., on payment of a deposit of Two Guineas (by cheque), which will be returned on receipt of a *bonâ-fide* Tender by the date named below. Sealed Tenders, endorsed "Tender for Trial Boring," to be delivered to the undersigned not later than Friday, the 24th July, 1914.

The Council do not bind themselves to accept the lowest or any Tender.

(By order of the Council)

HENRY GREEN,
Solicitor and Clerk.

Howden, East Yorks. (1,780)

BOROUGH OF COLCHESTER.

TENDERS FOR WOOD-BLOCK PAVING.

The Roads and Drainage Committee of the Urban District Council invite Tenders for the Laying of about 10,000 square yards of Wood-block Paving, partly on Cement Concrete Foundations, including the removal of existing granite sett paving, macadam, &c.

Specifications, Quantities, Conditions of Contract, &c., can be obtained at my Office on payment of One Guinea, which will be returned on receipt of a *bonâ-fide* Tender.

Sealed Tenders, endorsed "Wood-block Paving," to be sent to me not later than 9 a.m. Wednesday, 29th July, 1914.

The Committee do not bind themselves to recommend the Council to accept the lowest or any Tender.

(By order)

HAROLD COLLINS, ASSOC.M.INST.C.E.,
Borough Engineer and Surveyor.

Town Hall, Colchester.
July 8, 1914. (1,779)

BOROUGH OF WORKINGTON.

The Corporation of Workington require the services of an experienced Road Foreman, and are prepared to receive applications from persons whose age must not exceed 45, and who must have a thorough experience in modern road construction and maintenance, including tar and bituminous bound roads, sewer construction, and all other duties which generally appertain to the office.

He must also be thoroughly experienced in the supervising and organisation of manual and team labour.

Preference will be given to candidates who have held a similar position under a Local Authority, and who are also able to cycle.

The salary will be £2 5s. per week.

Applications, in candidate's own handwriting, stating age, experience, present and previous appointments, accompanied by three recent testimonials, to be sent to the undersigned, endorsed "Road Foreman," by Tuesday, the 21st instant.

Canvassing will disqualify any candidate.

H. BOWMAN WILLIAMS,
Borough Engineer and Surveyor.

Town Hall, Workington.
July 8, 1914. (1,778)

LAND SURVEYORS required by Hong Kong Government. Three years; possible extension. Salary £330—£10—£350. Further increments to £420 if engagement extended. Travelling allowance 360 dollars per annum. First-class passages. Age 23—28, unmarried. Candidates with a thorough knowledge of surveying with the theodolite and level, who are neat draughtsmen and quick at figures, and capable of carrying out extensive surveys over rough, hilly country, and intricate surveys of city lots covering large areas of steep hill-side land, and who are also proficient in checking and closing traverses by co-ordinates, preparing plans and sections, and computing areas, should apply at once to the Crown Agents for the Colonies, Whitehall-gardens, S.W. (1,781)

PERSONAL.

Mr. Goodhind, Pontypridd, has been appointed assistant surveyor to the Slough Urban District Council.

Mr. H. G. Watts, of Faringdon, Berks., was on Wednesday appointed surveyor to the Kingswood Urban District Council.

Mr. J. H. Ewell, of the county surveyor's department, Shire Hall, Durham, has been appointed assistant to the county surveyor of West Suffolk.

Mr. Francis J. Weddle, borough surveyor and inspector of Okehampton, has been appointed surveyor and inspector to the Bude and Stratton Urban District Council.

Mr. F. R. Gibbins, of the city surveyor's office, Manchester, has been appointed assistant engineer and surveyor to the Cheadle and Gatley Urban District Council. Previous to going to Manchester, Mr. Gibbins was for six years assistant to Mr. G. W. Holmes, engineer to the Walthamstow Urban District Council.

Mr. T. Waddingham, surveyor to the Hebden Bridge Urban District Council, who, as previously stated, has retired on account of ill-health, after 40 years' service, has been presented with a testimonial, passed unanimously by the council, expressing high appreciation of the conscientious service he rendered as surveyor and waterworks engineer during his term of office, upwards of eight years. Three councils, it may be stated, had previously given Mr. Waddingham testimonials under seal.

Mr. Albert E. Brookes, county surveyor of Cornwall, whose appointment as county surveyor of Durham has been confirmed by the Durham County Council, is 44 years of age. He is a native of Lancashire, and began his career as articled pupil and assistant to Messrs. Firth & Sheldon, of Macclesfield, and from 1890 to 1896 acted as divisional surveyor of main roads to the Hertfordshire County Council. In the latter year he was appointed chief assistant county surveyor of Worcestershire and in

Mr. Albert E. Brookes.

1907 he obtained the position of county surveyor for the Western Division of Cornwall, succeeding to the surveyorship of the whole county in 1911. He has had a large and varied experience in all branches of county work, and in the promotion schemes requiring Parliamentary, Local Government Board, and Board of Trade sanction. Recently he has prepared an important scheme for maining about 70 miles of district roads in Cornwall, and dismaining some existing main roads, which has been adopted by the county council, and is now under the consideration of the district authorities concerned. His progressive policy commended itself to both the Main Roads Committee and the county council, and he was successful in obtaining extensive reforms in organisation and administration under circumstances of considerable difficulty.

THE ROAD BOARD.

GRANTS TO HIGHWAY AUTHORITIES: FIFTEENTH LIST.

During the months of April, May and June, 1914, the Road Board indicated additional advances to highway authorities amounting in the aggregate to £340,112, of which £277,357 was by way of grant and £62,755 by way of loan.

The total advances made and indicated up to June 30, 1914, amount to £5,553,924—£4,106,462 by way of grant and £1,447,462 by way of loan.

The formal advances by way of grant made, with the approval of the Treasury, during the last quarter, amounting to £267,426 were applied as follows:—

Road crust improvements	£231,753
Road widenings and improvement of curves and corners	24,016
Road diversions	5,125
Reconstruction and improvement of bridges	4,542
New roads and bridges	1,000

During the same period advances by way of loan amounting to the sum of £105,266 have been arranged.

Royal Sanitary Institute.

ANNUAL CONGRESS AND EXHIBITION AT BLACKPOOL.

Nearly one thousand delegates from all parts of the United Kingdom are attending the twenty-ninth congress of the Royal Sanitary Institute which opened on Monday at Blackpool. The Mayor of Blackpool (Councillor J. Dewhurst) who was accompanied by the Mayoress and Lord Derby (the president of the congress) and a number of members of the corporation, received at the Hall Metropole those attending the congress, and presided at a luncheon which followed. Subsequently, at the Grand Theatre, Lord Derby delivered his presidential address, Sir Henry Tanner, chairman of the council of the institute, presiding.

At the luncheon, Councillor J. Collins, J.P., in proposing the toast of "The Royal Sanitary Institute," said the value and importance of the work of that body must command the respect and support of all who were interested in the matter of public health. Things were once in a deplorable condition and so recently as thirty-four years ago it was necessary to found that institute to remove many of the evils which were then adding to the death-rate. The objects of that institute were not local, nor even national, for the sphere of usefulness extended to Canada, India, British South Africa, Australia, New Zealand, and other countries.

Sir HENRY TANNER, in reply, to the toast, expressed cordial thanks to the Corporation of Blackpool for the generous manner in which they were entertaining the delegates, and for the excellent arrangements made for their comfort and well-being.

Mr EDWIN T. HALL, F.R.I.B.A., in proposing the health of "The Mayor and the Corporation of Blackpool," spoke of the growth of Blackpool, mentioning that it was well shown in the attendance list of 1876, and, referring to the corporation enterprise, said that out of a sand heap had been raised a city of palaces. In 1800 the population was only 500. That was 114 years ago, and it was curious to note that during that time the population had increased 114 times. The town had increased its population five times within the past thirty-three years.

In replying, Alderman HAMPSON observed that the institute were engaged in a very important work, and were entitled to all the assistance that could be given from municipal authorities.

PRESIDENTIAL ADDRESS.

Lord Derby chose for the subject of his presidential address the Health of the Army as a Factor in the Health of the Nation at Large. His LORDSHIP said he was very glad that the congress was being held in this part of Lancashire, because he felt perfectly certain that the delegates would find in the towns of Lancashire that everything possible was being done for the inhabitants, and that everybody in authority was willing to learn to do more if necessary. In addition to that, the delegates would find no more health-giving places than the towns on the Lancashire sea coast, at whatever time they paid a visit.

A vote of thanks was passed to Lord Derby for his address.

CONFERENCE OF ENGINEERS AND SURVEYORS.

The conference of engineers and surveyors to councils and other sanitary authorities was held on Tuesday morning, under the presidency of MR. J. S. BRODIE, M.INST.C.E., Borough Engineer and Surveyor of Blackpool.

In his opening address Mr. Brodie observed that the outstanding subjects of the past year of greatest interest, not only to municipal engineers and surveyors, but also to the general public who are interested in municipal government, had been *(a)* The construction and maintenance of highways; *(b)* Housing and town planning; *(c)* Water supply; *(d)* Sewage disposal; and *(e)* Labour unrest in municipal service.

HIGHWAY ENGINEERING.

The Third International Road Congress held in London last year was an event of first-rate importance in regard to roads and road-making in this country, and the voluminous report of the proceedings of the congress, just recently received, would form a most valuable addition to their knowledge of the subject, and a most useful form of reference for road surveyors and public authorities in charge of highways in the future.

So far as could at present be seen, some form of macadamised road surface, bound with bituminous or asphaltic materials, instead of with water, will be the road surface of the future for moderate amounts of traffic, and it was satisfactory to them, as sanitary engineers, to note one of the "particular conclusions" arrived at by the congress, namely: "That sufficient information is now available to enable engineers to select and specify bituminous binders which will have no prejudicial effect upon public health, fish life, or vegetation; but which, on the contrary, will conduce to conditions of considerable hygienic advantage."

Another conclusion arrived at by the congress was: "That subject to certain precautions, such as impregnating of the wood, waterproofing of the joints and surface, frequent cleaning of the roadway, &c., there is no objection to wood paving from a sanitary point of view." That conclusion was especially interesting to Blackpool, inasmuch as there was probably a greater percentage of wood pavement there than in any other British town.

HOUSING AND TOWN PLANNING.

From a memorandum recently issued by the Local Government Board, it appeared that for the year ending December 31st last the results of the operations of local authorities under the Housing and Town Planning Act, 1909, were as follows: 30,707 houses were reported against; 18,407 houses were made fit for habitation without closing orders, 2,116 houses were closed or demolished voluntarily, 10,695 closing orders were made, 1,550 houses were demolished after the issue of closing orders, 2,193 demolishing orders were made, also that for the three years ending March 31st, 1913, 129,620 houses had been made fit for habitation at the cost of the owners, and that for the five years ending on the same date the Board had sanctioned loans amounting to £1,403,869 for the erection of 6,357 houses, at an average of £220 per house.

As regards the progress of town planning under the same Act, the following are the results reported by the board up to December 31st: Two schemes had been finally approved by the board of an area of 3,762 acres. Three schemes had been prepared and submitted of an area of 6,503 acres. Forty-seven schemes had been authorised to be prepared or adopted by local authorities of an area of 70,900 acres, and fourteen applications for authority to prepare schemes were under consideration by the board of an area of 29,761 acres.

During the four years that the Town Planning Act has been in operation it had been found that the procedure, especially in regard to work required to be done before even an application to the board for authority to prepare a scheme could be made, was altogether too elaborate and irksome, and consequently the board had recently issued amended town planning procedure regulations whereby the preliminary work, especially in the preparation of maps, had been simplified without sacrificing any necessary safeguards. It was to be hoped that the result of these amended regulations would be materially to speed up progress in town planning in the immediate future.

On the more practical side of the subject of town planning might be noted the commencement during the past year of the actual laying out of the new capital of India, on the southern site closely adjacent to the ancient imperial city of Delhi, as recommended by Messrs. Swinton, Brodie, and Lutyens, also the adoption in principle by the Government of Australia of the plan prepared by Mr. W. B. Griffin, of Chicago, for laying out the proposed new capital city of the Commonwealth, which was awarded the first prize of £1,750.

It was also satisfactory to find that in our own

[illegible] the city of Birmingham has got its two [illegible] finally supplied and [illegible] a [illegible] pumping plant in the Elan Valley.

WATER SUPPLY.

In the matter of public water supplies the new [illegible] as an addition of 200 million gallons per day for the city of New York from the Catskill Mountains, a distance of 120 miles, at a cost of 40 millions sterling, is only exceeded a world record.

In the future [illegible] the question as to dealing with public water supplies as a whole, instead of each community rushing to be first in the field to [illegible] was coming more and more to the front, and it was to be hoped that before very long public opinion would move more quickly towards legislation in this direction.

A new suggestion was made in a recent memoir of the geological survey staff to the effect that deep wells from which water was pumped might be artificially replenished by rain-water falling on impervious surfaces being drained into dumb wells sunk through the impervious stratification into the water-bearing strata below, from which the pumped water supplies were obtained.

A great deal of [illegible] to public water authorities was the comparatively short-period loans allowed by the Local Government Board for reservoir construction. The only way to overcome that was in the increasing use of reinforced concrete construction, by which the first cost of the work was so much reduced that there was no extra burden in meeting repayment of loans for the shorter period, and the great advantage of the loan being repaid altogether in much shorter time.

SEWERAGE AND SEWAGE DISPOSAL.

As in the case of public water supplies, so, in a lesser degree, in that of sewerage schemes, an enormous saving in cost, with much greater efficiency, would be attained if, instead of working in small units and within boundaries absolutely unsuitable for the best and most economical sewerage arrangements, larger combined areas, in which the watershed would be the unit, were adopted. In the latter case provision could be made for the future at a tithe of the cost entailed in each little district working out its own tiny scheme, regardless alike both as to its neighbours and the future.

A good example of the "better way" was seen in the combined scheme for the sewerage of Rochester and Chatham, under Mr. Radford, now being carried out at an estimated cost of £300,000.

The issue by the Royal Commission on Sewage Disposal of their eighth report with the appendix thereto in the autumn of last year, relaxing the general standard for sewage effluents under special conditions, necessitated a restatement of our conclusions on this important subject. It now appeared that special standards might be desirable "as local circumstances require or permit," and that where sewage was discharged into a stream where there was a dilution of from 150 to 300 volumes of water to 1 volume of sewage, the latter must not contain more than three parts per 100,000 of suspended matter; if the dilution was as much as from 300 to 500 to 1, then the effluent might contain as much as fifteen parts per 100,000, and lastly, if the dilution is 500 to 1 and upwards then the sewage might be discharged in its crude state without further treatment than by screens or detritus tanks. It must, however, be kept in mind that the diluting water in the stream or river must itself be of a standard quality of purity under the suggestions made by the commissioners.

MUNICIPAL LABOUR UNREST.

Two strikes among workmen engaged on municipal service had occurred during the past year, one at Leeds and another at Blackburn. Much inconvenience to the community, danger to the public health, and serious financial loss had been sustained in both towns.

In the case of Leeds it had been found necessary, in order effectually and successfully to cope with such an abnormal state of things, to set up for the time being a kind of council of war, consisting of a committee of seven aldermen, with a commander-in-chief in the person of the tramways manager, in order that, as regarded labour, the several departments of the city corporation might be adequately organised and correlated successfully to meet the enemy in the shape of the men's unions. It was possible that, while going so far, the City Council of Leeds had gone far enough, and that the end in view might be more certainly accomplished if the control exercised by the Council of Darlington, which [illegible] appointed, for some years, a City Manager, who would be the executive head of the municipal service, responsible for the efficient working of all the departments, with power of appointing and removing all subordinate officers, and carrying on the business of the city.

These experiments in municipal administration should be watched with interest both in this country and America, and although not unknown on the Continent, they were a somewhat novel departure in democratic England-speaking communities.

In addition to the leading features of municipal engineering, as lightly touched upon in the foregoing remarks, there were other departments of scarcely less importance. In regard to the collection and disposal of house refuse, it was really a disgrace to us, in this mechanical age, that we had not yet evolved a more satisfactory method of house-refuse collection than by calling at each separate house with a dust-cart and a couple of grimy workmen. Again, in the matter of disposal, the method of burning was certainly the easiest and the most efficacious, as regarded the prevention of an offensive nuisance; but it could not be denied that the system of disposing of house-refuse by converting it into a valuable fertilising manure was less wasteful, and therefore more truly scientific, than by burning.

"And now, in drawing these few remarks to a close, may we venture," said Mr. Brodie, "as humble workers in applied sanitary science, to attempt to peer just a little into the future? A distinguished living writer has told us that 'the scientific process is not a marketable conjuring trick, but is, in reality, the gift of prophecy.' May we therefore, in the true spirit of scientific optimism, discern the approaching time when all highways will be clean, noiseless, non-slippery, and well-lighted, when every man, however poor, will, if he cares to, be the owner of his own comfortable home; when all towns and villages will have wide, beautiful, tree-shaded streets; when every cottage, however much isolated in the country, will have an abundant supply of good and pure water, adequate drainage, and pure fresh air; when heat and light will be laid on to every dwelling house in the shape of a gas, a liquid, or an electric current, and coals and coke will be unknown articles near the habitation of man; when house-refuse will be removed from each house by means of pipes or tubes, as sewage is at present, and used to replenish the earth from whence it came? When these scientific forecasts, or prophecies, have come to pass (and they are now visible to the eye of faith), then shall we municipal engineers and surveyors feel that our efforts in 'directing the forces of Nature for the use and convenience of man' have not been in vain."

Mr. E. G. Mawbey, borough engineer of Leicester, proposed a vote of thanks to Mr. Brodie. Knowing as they did that Mr. Brodie occupied a place in the front rank of municipal engineers, they had expected to hear a good address from him, and had got one. It was characteristic of him that whatever he undertook he did well, and he was sure they would all admit that his address was exceedingly instructive and suggestive. It bristled with information which it was very helpful to have—on the up-to-date sanitary engineering works that were going on at the present day. There were some fine examples of engineering work in Blackpool, and Mr. Brodie had stamped his name, energies and ability on the town.

Mr. C. Brownridge, borough engineer of Birkenhead, seconded, and the vote of thanks was passed.

The conference then proceeded to the consideration of papers.

(To be continued.)

HEALTH EXHIBITION.

If not of a very extensive character, the Health Exhibition which is being held in connection with the congress contains much of interest to sanitarians. There are some fifty stands, and several well-known firms engaged in the supply of apparatus and material for municipal and public works purposes are among the exhibitors. The exhibition, which is housed in the old skating rink, was formally declared open on Saturday by the mayor (Councillor Dewhurst), who aptly pointed out that it would serve as a practical illustration of the subjects to

be discussed at the congress, while at the same time long questions of health and sanitation claim a large number of people who were not attending the meetings. The exhibits illustrated many sides of public health work, from large appliances suitable for municipalities down to the various sanitary fittings of the house and home, and even smaller matters relating to personal health and comfort.

Rowe Bros. & Co., Limited.

One of the largest stands in the exhibition is that in the occupation of Messrs. Rowe Bros. and Co., Limited, City Lead Works, Liverpool. "Rolo" and "Libiex" baths are an assortment of bath-room fittings, lavatory basins, and school or workshop lavatory ranges, and a variety of pedestals and seats make up an excellent display.

Jones & Attwood, Limited.

Working models of the Feldtan and J. and A. patent sewage wheel distributors are a striking feature of the exhibit of Messrs. Jones & Attwood, Limited, of Stourbridge. The models in question illustrate the application of the "sewage wheel" to both circular and rectangular beds. It will be remembered that an article appeared in The Surveyor of last week, in connection with the important installation of this firm's distributors at Cudworth, and their advantages were set out as follows: "No small holes are employed, the edges of the water-wheel buckets throwing off the liquid in fine drops over the whole filter surface in very small doses, and at any rate of flow, while the feed weirs allow of exact adjustment to give even distribution over all parts of the filter at any varying rate of flow. Heating apparatus for domestic hot water supply forms another important branch of Messrs. Jones & Attwood's work, and at Blackpool they are drawing attention to their patent "Batheater" boiler and circulating cylinder combined, for fixing in kitchen or scullery. This is designed specially for use with hard waters containing much sediment. The cylinder can be easily removed, exposing the whole interior of the boiler and cylinder so that every portion can be thoroughly cleaned, thus prolonging the life of the boiler. The complete Patent "Batheater" has a sheet-steel outer casing, lined with silicate cotton non-conductor, which conserves the heat of the water over a long period. The fire-opening has a removable grate, which affords easy lighting and cleaning, and when the door is open the advantages of an open fire are obtained.

Patent Lightning Crusher Company, Limited.

Photos and drawings of the patent lightning dust manipulator and crusher of this firm—whose offices are at 14A Rosebery-avenue, Grays Inn-road, London, E.C.—fill one of the wall spaces in the exhibition. In our special annual issue in January last we reported that the company's system of disposing of house-refuse by converting it into manure seems to meet with increased favour at the hands of municipal councils. Up to six months ago over 100,000 tons of refuse converted by the dust manipulators at Southwark had been sold by the borough council; and operations on an equally extensive scale are being carried on by public authorities in Lancashire, Yorkshire and other counties. It is claimed for the machines, and from what we know of their working not without justification, that they get rid of the house-refuse nuisance altogether, while at the same time effecting a considerable saving to the bodies which adopt them.

Silent Flushing Cisterns, Limited.

The "Mute" is the appropriate name given to the flushing cisterns manufactured by this firm, the action of the apparatus, as the name implies, taking place with a remarkable freedom from noise.

Edward Woolley.

Mr. Edward Woolley, Canal Foundry, Church, near Accrington, Lancs, has an interesting display of street name plates, notice plates, road direction posts and plates, manhole and inspection covers, gully grates, and ornamental standards and chains.

"Firmit" Flooring Co., Limited.

This firm, whose works are at 17 and 20 Birley-street, Blackpool, exhibit their "Firmit" jointless flooring and "Lilywhyte" marble wall covering.

Stourbridge Glazed Brick & Fire Clay Co., Limited.

The "Gravisede" flushing system is among the exhibits of this well known Dudley firm. With this system there is only one ball valve to a whole range of closets, no matter how many closets there are on the range. Each cistern is directly connected with a full pressure from the main supply. The whole system can also be drained perfectly dry, which is often necessary for schools during winter holidays. Mention may also be made of a special closet set produced to meet the requirements for various authorities for conversion [illegible]. The closet pan is made with a flat back to fit up against the wall, and can either be supplied with side pads or hinged seat as required.

Webb Lamp Co., Limited.

The Webb Lamp Company's patent sewer ventilating lamp is shown in operation, with air-meter attached, indicating the amount of work done. The firm's non-return inlet ventilators for sewers and sewage tanks, silt dredgers, drain cleaning tools and an assortment of fire extincteurs also find a place on the stand.

Bristowe & Co., Limited.

Messrs. Bristowe & Co., Limited, 11 Tothill-street Westminster, are showing samples of trass and pumice gravel. A natural volcanic material which contains the highest siliceous properties of puzzolana, trass is claimed to impart greater strength and flexibility to concretes and mortars, and to be especially valuable when the latter are used in sea water. It can be employed with pure or hydraulic lime, and produces a highly impervious and durable concrete. The firm's pumice gravel is described as being admirably adapted for all purposes for which concrete breeze has formerly been used, and as possessing none of the disadvantages of the material. It has a low power of absorption, and will stand a high compressive strain, and may be said therefore to be peculiarly adapted for sewage contact and filter beds. The various uses of "Tarvia" are illustrated by samples of that material, and the attention of visitors to the exhibition is also being drawn to the "Cantar" road tarring machine, for which Messrs. Bristowe and Co. are the sole agents and manufacturers. Their No. 1 machine, it may be mentioned, has a capacity of 75 gallons, and is capable of supplying sufficient tar or tar compound heated to a temperature of 200 deg. Fahr. to spray 3,500 super. yds. of road surface per day, provided the fire has proper attention. The spraying apparatus is likewise adapted to deal with this quantity in an ordinary working day, and is fitted with pump filter, thermometer, pressure gauge (to ensure the same quantity being applied throughout), balanced swivel boom or hose carrier, 21-ft. flexible hose, and mono wheel or scythe sprayer fitted with three jets. The machine is fitted with a patent removable firebox, by which means the temperature of the tar can be readily controlled without raking out the fire, and should the liquid have a tendency to rise through heating the firebox can be easily withdrawn, and thus avert danger. As a second precautionary measure the boiler has a fixed cover fitted with a sliding lid for filling purposes, and has stout angle irons across the top which are hollowed for the reception of a barrel.

Dr. R. H. Quine.

Improvements in ashbins are exhibited by Dr. R. H. Quine (per Sanataries Limited, Pendleton, Manchester), and are deserving of the notice of visitors to the exhibition.

William Boby.

The distinctive feature of the automatic water softener of Mr. Wm. Boby, Salisbury House, London Wall, E.C., which is on view, is the absence of reagent solution, the attention required taking the form of simply placing some powder in a circular box. A "Boby Patent Sterilising Apparatus" is also shown upon the stand. It has been designed for the treatment in bulk of water supplies containing organic and bacteriological impurities.

Improved Sanitary Appliances Co., Limited.

Adjustable cantilever water-closets are shown by the Improved Sanitary Appliances Company, Limited, Paradise-street, Birmingham. The advantages of these is that they can be set at any angle to suit the position of the outside perpendicular soil pipe.

An admirable loan exhibit is that arranged by the Blackpool Corporation Highways Department under the direction of the borough engineer, Mr. J. S. Brodie.

among surveyors who are not content to assume that

Board, having been embodied by that authority in the new edition of their General Directions and Specifi-

sample.

LIST OF AWARDS.

SILVER MEDALS

W. M. Angle—Electric light pelton set generator.
William Boby—Water softener.
British Sanitary Company—Earth closets.
Fabrique Stove Company, Limited—Interior stoves.
Jones & Attwood, Limited—Refuse garage wheel distributor.
Jones & Attwood, Limited—Drawing and copying and sanitary appliances.
Limmer Asphalte Paving Company, Limited—Limmer rock asphalt.
Metallic Patent Earth Closet Company, Limited—Earth closets.
Rowe Bros. & Co., Limited—Lead Piping.
Slack & Brownlow—Brownlow germ filters.
Stourbridge Glazed Brick and Fire Clay Company, Limited—Gravisede flushing system.
Tagliabue, Limited—Tagliabue tall radiometer.

BRONZE MEDALS

"Austral" Window Balance Company, Limited—"Austral" window.
Blackpool and Flyde Cremation Society—Crematoria.
William Boby—Water sterilising apparatus.
Bristowe & Co., Limited—Robbins non-set plastic cement, Tarvia.
Cremation Society of England—Crematoria.
Gilmour Door Company, Limited—Hospital flush glazed door.
Improved Sanitary Appliances Company, Limited—Cantilever traps and branches for closets and sinks.
Jones & Attwood, Limited—"Bathwater" heater and circulating cylinder.
Edwin A. Mansfield & Co.—Blastless gas blow-pipe burners.
Edwin A. Mansfield & Co.—Wireless electric pipe locator.
Dr. R. H. Quine—Wall ashbin.
Renton, Gibbs, & Co., Limited—Hot and cold water mixing valves.
Rotak, Limited—"Rotak."
Rowe Bros. & Co., Limited—Baths, lavatories, and sinks.

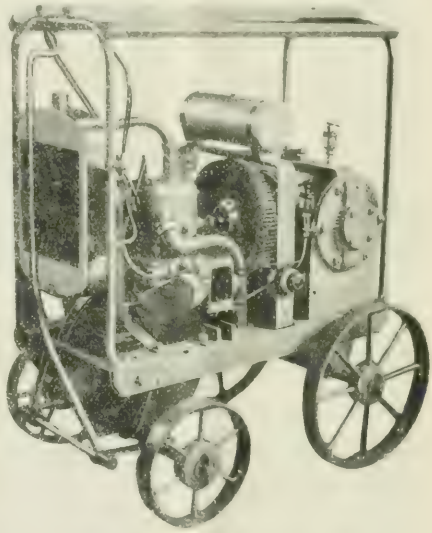
CESSPOOL EMPTYING PORTABLE PLANT.

In connection with a main drainage scheme existing [illegible] portable power-driven pumping set [illegible] expeditiously and efficiently with due regard to satisfactory hygienic conditions, [illegible] cesspools and

Messrs. Norman Dickson Pringle & Co., of Hearts Wills Bear Street Chiswick, have supplied a typical [illegible] which consists of a number of portable petrol-driven sets for doing work of this kind. The plant consists of a petrol "Ender" [illegible] plug, [illegible] and silent gearing by a powerful petrol engine. The ignition is of the [illegible] and the engine is water-



"Ender" Cesspool-emptying Plant.

cooled with fan and radiator, the water circulation being on the Thermo-syphon system. A highly efficient silencer is fitted, and the whole is mounted on a substantial steel frame on cast-iron travelling wheels, and is entirely protected from the weather by a canvas canopy supported on a strong frame. The pump is connected to a horse-drawn receiver (of, say, 500 gallons capacity), which is then exhausted to a high vacuum. On opening a valve, the material rushes into the receiver, filling it in a few minutes from the commencement of operations. The receiver is then drawn away and another is coupled up to the pump.

The obnoxious gas passing through the pump is led into a brazier and consumed, while the pipe through which the matter from the cesspool passes can be cleaned by sucking fresh water from a bucket.

The makers inform us that they have supplied a large number of portable petrol-driven air pump sets to the Government, and that these plants are working all day long in crowded thoroughfares, showing that special attention has been paid to robustness of design and silence in running.

Surveyors who are desirous of installing apparatus of this class would certainly be interested in this well-made little plant.

Messrs. Norman Dickson, Pringle & Co. also manufacture fixed or portable power-driven pneumatic chasing tool sets, which are in some demand among builders and contractors for such purposes as chasing grooves in walls to receive electric wires.

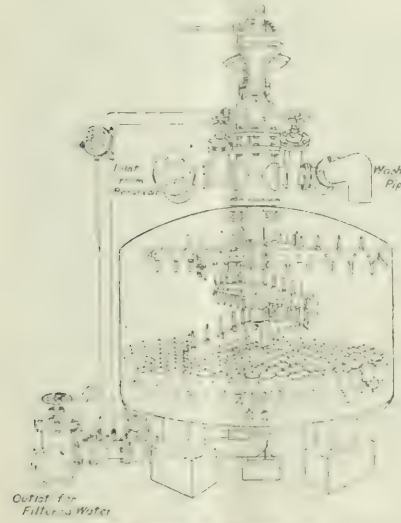
WATER SUPPLY AT STOCKPORT.

EXPERIENCE OF MECHANICAL FILTRATION.

A paper descriptive of the waterworks in his district was prepared by Mr. Thomas Molyneux, Assoc.M.Inst.C.E., Corporation Water Engineer, Stockport, president of the Institution of Water Engineers, in connection with the recent annual summer meeting of that body. It appears that a portion of the Kinder-gathering ground is covered with a peaty deposit which at times affects the water considerably, and the installation of mechanical filters was decided upon.

There are three batteries of filters capable of filtering 3,750,000 gallons per day, each battery consisting of eight steel drums, each 8-ft. in diameter, and 4-ft. in height, charged with Leighton Buzzard sand, and capable of filtering about 1,250,000 gallons per day.

The water is delivered (by gravitation from the reservoir) into the top of the drums, and as it enters the filters it operates a series of motors which pump a standard aluminoferric solution in prescribed quantities into the raw water at the filter inlet. These motors are adjustable so that the quantity of the coagulant can be varied. The aluminoferric is dissolved in six rectangular tanks in the upper story of the annexe; from these tanks it gravitates through a ball valve into a small cistern fixed in the main building, from which it is drawn by the motor driven pumps.



Section of Filter at Kinder Waterworks, Stockport.

Lime, as lime-water, is also added to the water in proportions regulated by Venturi tubes as required, and measured by manometer. The lime, which is purchased, is guaranteed to contain 98 per cent. of Ca.O., is first slaked and then placed in four cylindrical drums 6-ft. diameter by 20 ft. high, one for each battery and one spare. Water passed upwards through the lime drums becomes a saturated solution containing 70 grains per gallon, and is then passed through Venturi tubes at the requisite rate.

The filters are washed once every 24 hours with filtered water from the adjoining filters, which passes the reverse way through the filters, the sand meanwhile being agitated by a series of arms on a central revolving shaft in each drum. These arms are hollow and have jets through which the water passes, thus thoroughly cleansing the sand. On the ends of the arms are extensions which scrape the sides of the drum to prevent the sand and any detritus which has crept down the sides from adhering and becoming foul.

The whole of the power for the plant is obtained from the compensation water.

The experience obtained with the plant, which has now been working since Sept. 1912, is summarised in the subjoined table:—

Date.	February 18, 1914.		March 24, 1914.		April 21, 1914.	
	Unfiltered.	Filtered.	Unfiltered.	Filtered.	Unfiltered.	Filtered.
Free ammonia	0·0010	0·0022	0·0188	0·0038	0·0040	0·0026
Alb. ammonia	0·050	0·0041	0·0946	0·0046	0·0054	0·0024
Oxygen absorbed, 4 hrs. at 80° F.	0·152	0·020	0·148	0·020	0·160	0·028
Nitrites, survey at 24 hrs.	0·12	0	0·08	0	0·095	0
Bacteria, growth at 72 hrs. at 8·5° C.	66	4	41	0	21	0

Note. Results expressed in parts per 100,000. The plant was taken over by the contractors' hands at the beginning of December 1913.

It must be borne in mind that the above results were obtained with the water which first entered the new reservoir, and that, as there is no by-channel, the flood water passes through the reservoir, causing the supply to be very turbid at times, but even in these adverse circumstances the results were in every case satisfactory and the water supplied was bacteriologically, chemically and physically of excellent quality.

COTTAGE BUILDING IN RURAL DISTRICTS.*

By T. Wickford Poulter.

In estimating the cost of cottages at the various competitions and exhibitions which have been held so frequently of late it has been customary to give a figure which covers the nett cost of the actual building only; but as everyone knows, excepting some of those who have to pay, there are several expenses which have to be met before cottages can be occupied which should be reckoned as part of their cost. I particularly refer to water supply, drainage, paving paths, and fencing. Of course these items vary very considerably, but in building in towns they can be estimated for comparatively easily. I do not propose to give any figures (excepting they are of general application), as in very few cases can they be comparable one with another, but it may safely be reckoned that 20 per cent should be allowed for these necessities, and even then it largely depends upon the site and the stringency of the local by-laws.

Nearly all the model plans, many of which are excellent so far as they go, also make very little, if any, provision for outbuildings, and in the country these are almost as essential as living rooms. If the tenants do not find them they invariably proceed to erect something themselves, erections probably which are neither sightly nor advisable from a health point of view. They are a constant source of trouble both to a landlord who desires to preserve the amenities of the village, and to the rural district council who wish to administer their by-laws impartially, but to anyone who, living in the country, can enter into the cottagers' necessities, it does not seem to be an unreasonable requirement on the occupiers' part.

* Extracts from a paper read at the Royal Sanitary Institute Congress at Blackpool.

Air Compressors. Messrs. Allen & MacLellan, Limited, Sentinel Works, Polmadie, Glasgow, have issued a new compressor catalogue. The book gives dimensions, weights, prices, and fullest particulars of air compressors of capacities from 25 ft. to 25,000 ft. of free air per minute. In addition to this it includes in articles on air piping, air lift pumping, compressed-air forge hammers, drying air, cooling air, &c., an immense amount of practical data accumulated during the sale of over 2,000 "Sentinel" compressors.

TOWN PLANNING.

MR. THOMAS ADAMS AT THE CHELTENHAM CONFERENCE.

At the opening sitting of the Town Planning Section of the conference [illegible] Mr. Thomas Adams, the Local Government Board [illegible]

Mr. Adams said that town planning had, of course, been taken somewhat late. They were faced with the fact that many of their towns were already developed [illegible] with questions relating to the undeveloped land. But it would be a mistake to be too general in the application of that theory, for a properly considered plan of a town must have definite relations to every part of that town. When they came to prepare their plans, although they could only apply a town planning scheme proper to their undeveloped land, every engineer who undertook his work properly took into consideration the width of existing streets, the number of buildings, and the probable need of widening the streets, and prepared his plans for suburban development in connection with the scheme for the whole city. They might not be able to include much in their developed scheme, but let them not accept the principle that land already built on could not be included.

It would certainly be necessary for them to make out a "case" to include for the Local Government Board, but, having done so, a large part of the land already built upon might form part of the area of the scheme. Engineers should work up their schemes as if they had power to deal with built-upon land, existing streets, and whatever they considered suitable before applying to the Local Government Board.

ARTERIAL ROADS.

The question of dealing with arterial roads was one to which engineers had to apply their skill. The arterial roads at Ruislip were 60 ft. wide, and that was a fair proportion to allow, considering that no contribution had been made by any outside authority. In that scheme the first onus of constructing a street rested upon the owner, but the authority had power to come in after one notice and construct a street and charge a proportion of the cost against the owner under the Private Street Works Act. The apportionment was to be arranged in accordance [illegible] the benefit that accrued from the property, and an instalment system might be adopted which enabled the owner gradually to redeem his property, the Local Government Board being the final arbiter on the question. That seemed to be a fairly good working arrangement, and it was hoped that in practice it would be beneficial to the owner and to the authority.

It did not yet seem to be realised how great was the advantage derived from putting in an application for sanction for a scheme when it had been decided to prepare one. The reason was that, under our Town Planning Act, there were, in the first stage, two very important powers given to local authorities. One was that under sec. 58 (2) no owner could claim compensation for anything that contravened the proposed scheme after the time that the Local Government Board received notice of its preparation. Another point was that, under sec. 59, with regard to compensation, the public authority could limit the number of houses to the acre and prescribe the height and character of the buildings if they could satisfy the Local Government Board that their requirements were reasonable. These two things together enabled authorities to exercise a certain amount of control over their district before their scheme was prepared. The only risk they ran was that if their limit of houses was regarded by the Local Government Board as unreasonable they would have to compensate the owner. But that risk was altogether negligible.

PROGRESS OF TOWN PLANNING.

Regarding the general progress of town planning, the number of schemes submitted so far was only six. It was desirable that local authorities should not hold up the preparation of their schemes too long, because an owner would want to know where he stood. But anyone who was preparing a plan for the future development of a city could not do it in a week, nor, perhaps, in a year. It took two or three years to settle questions with owners, and therefore there was no reason to be disappointed at the rate of progress, especially as 200 authorities were working out the first stage, and sixty-five of them had already applied to the Local Government Board for the preparation of ninety schemes, involving 142,000 acres. Last year there were fifty schemes before the Local Government Board, and this year ninety, so that considerable progress had been made. In London an area of about 1,000 square miles was earmarked, of which about 600 square miles were metropolitan.

He admitted that they had much to learn from what other countries were doing—both what to do and what not to do. Great, wide streets were hindrances to the development of a town. They had to learn that town planning ought to precede building development, and not to be suddenly thought of when building development was rapidly covering their suburbs.

SOME RECENT PUBLICATIONS.*

Modern Plumbing Practice.—Vol. i. An Account of Practical Lead-working and Plumbers' Materials. By J. Wright Clarke, M.R.S.I., and Walter Scott, A.R.S.I. Price 10s. nett. London: B. T. Batsford, Ltd.

This is the first volume of a work which is intended to form an exhaustive review of the plumber's craft. The whole will be completed in three volumes, each of which, however, is complete in itself, and can be purchased separately, the later ones dealing respectively with "Modern Sanitary Plumbing and Fittings" and "Practical Lead-working on Roofs." The conception of the work is due to the late Mr. J. Wright Clarke, who was for many years a most successful lecturer on plumbing and sanitary engineering at the Regent-street Polytechnic, and it is based upon his earlier book on "Plumbing Practice." The object of the author was to produce a standard comprehensive work covering modern plumbing practice in all its branches. Mr. Wright Clarke was an enthusiast who took no narrow view of his craft as regards either its importance or its possibilities, and it may be said at once that in the volume before us he has amply succeeded in carrying out his design so far as the particular subjects dealt with are concerned.

The volume opens with an elementary description of the metals used by plumbers, their origin, reduction, and manufacture into the forms used in the trade, but goes only so far as a working plumber ought to be informed. Some chapters are then devoted to casting lead into sheets and other forms in which it is used by plumbers. Neither lead-casting nor lead-burning have, so far as we are aware, ever been dealt with in a satisfactory manner in books on plumbing, and the fairly exhaustive section on the latter subject will doubtless be appreciated. A section has also been devoted to setting out the lines for, and making, pipe bends and elbows with the view to enabling the workman to appreciate the use of such lines, and thus avoid a useless waste of energy in partially preparing a piece of work and then placing it in its position to ascertain if it is being made to the proper shape. The chapters on making soldered joints are carried as far as possible; it is obvious that the skill necessary for the actual execution of such work can only be obtained by practice and not by studying written descriptions, a fact which the author wisely recognises. Lead-light glazing is another subject dealt with that will be found useful to practical plumbers, for the reason that they are frequently called upon either to make or repair such lights, especially in country places distant from towns.

The book contains an abundance of illustrations, which are not only exceptionally clear, but also very practical. We have no hesitation in recommending all who are in any way interested in the subject to become possessed of a book which is not only an excellent text book, but which also has permanent value as a work of reference.

Transactions of the Institution of Water Engineers.—Vol. xviii. Edited by Percy Griffith, M.Inst.C.E., F.G.S., Secretary. London: St. Bride's Press, Ltd.

This volume contains the proceedings of the eighteenth summer general meeting held at Wakefield,

*Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

and the eighteenth winter general meeting held in London, together with a table of contents and a subject index to vols. I.–XVIII., and a name index to vol. XVIII. The papers included in the volume are: "Underground Water Supplies in Yorkshire," by Prof. P. F. Kendall; "The Valuation of Waterworks Undertakings on Transfer to Municipal Authorities," by E. J. Silcock; "The Wakefield Corporation Waterworks," by C. Clemesha Smith; "Reservoir Storage in Relation to Stream Flow," by W. J. E. Binnie and H. Lapworth; "The Water Supply of Jersey," by A. J. Jenkins; "Animal Growths in Water-pipes," by S. C. Chapman; "Compulsory Returns by Water Undertakings," by J. Chisholm; "The Portland Urban District Council Waterworks," by R. S. Henshaw; "The Solubility of Carbonate of Lime and its Bearing on Certain Processes for the Treatment of Water Supplies," by W. T. Burgess; and "The Treatment of Plumbo-solvent Water by Means of Mechanical Filters," by F. J. Dixon.

DILAPIDATIONS AND FIXTURES. Seventh Edition. By Banister Fletcher and H. P. Fletcher, FF.R.I.B.A., Price 6s. 6d. London: B. T. Batsford, Limited.

In its seventh edition this well-known text-book has been revised and rewritten in the endeavour to bring it up to date, and all important recent decisions have been incorporated. The convenient method of tabulation which characterised former editions has been adhered to, and has been extended as far as possible. The subjects dealt with include covenants, nature and extent of dilapidations, method of taking dilapidations, surveyors, actions, powers of lessors, Agricultural Holdings Act, ecclesiastical dilapidations, forfeiture, fixtures and others. The last chapter contains a number of very useful questions and answers on points of practice. We need not say more than that the work is thoroughly up to the high standard which the profession has long since learned to expect from the authors.

COMMERCIAL PAINTS AND PAINTING. By A. S. Jennings. Price 6s. nett. London: Constable & Co., Limited.

This book has been written primarily for the architect, engineer and property owner, and is intended to show how a thoroughly desirable job of painting in its many and varied applications may be done at a minimum cost consistent with good material and good workmanship. Having this purpose in view, the author does not deal either with the manufacture of materials or the methods of the actual application of the paint. Nevertheless the work is of a sufficiently practical character, and deals, *inter alia*, with materials, the economic value of paint, the paint most suitable for various surfaces, mixing and application, tools, defects, and specifications. The work forms one of Messrs. Constable's well-known "Westminster" series.

BUILDING BY-LAWS IN RURAL DISTRICTS. By Sir William Chance, Bart., M.A. Price 1s. 6d. cloth, 1s. paper. London: P. S. King & Son.

This little book contains, in the first place, the paper which the author read at a meeting of the British Constitution Association in December, 1913, and upon which we commented at the time. It is here followed by the text of a Bill on the subject which passed through the House of Lords in 1906, and a revised code of building by-laws applicable to rural districts. Circulars of the Local Government Board dealing with rural by-laws are included as an appendix.

The two latest of the popular series of Homeland Handbooks deal respectively with "Bexhill and Its Surroundings" and "Falmouth, Truro, and the River Fal." They are published at 6d. nett.

Roadmen Who are Farmers.—The Denbigh Rural District Council recently declined to raise their roadmen's wages from 18s. weekly. It was argued that most of the roadmen are also small farmers, and had time off for agriculture.

Humane Slaughtering Apparatus.—Mr. Wm. H. Eley, engineer and surveyor to the Newmarket Urban District Council, writes: "I shall be obliged if you will permit me to enquire through your columns if there are any urban districts in the country who compel by by-law the use of humane apparatus for slaughtering animals whose carcases are used for human consumption."

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. J. S. PICKERING, M.INST C.E., Borough Surveyor and Water Engineer, Cheltenham.

EASTERN DISTRICT.

An Eastern District meeting will be held at Tilbury on July 25th.

CLEETHORPES MEETING.

A meeting of the institution will be held at Cleethorpes on September 19th.

SCARBOROUGH MEETING.

A meeting of the institution in the North-Eastern District will take place on Saturday, September 26th, at Scarborough.

EAST MIDLAND DISTRICT.

It is hoped that a District meeting will be held in South Leicestershire in the near future.

J. W. DUDLEY ROBINSON, B.SC.(LOND.),
Secretary.

92 Victoria-street,
Westminster, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. HORACE BOOT, M.I.E.E., M.I.MECH.E.

NORTHERN DISTRICT.

Meetings will be held at Alnwick on Saturday, July 18th, Sunderland on Saturday, October 10th, Newcastle on Saturday, November 7th, and Newcastle on Saturday, December 12th.

A Northern District meeting, in combination with Yorkshire, will be held at Harrogate on Saturday, September 12th.

B. WYAND,
39 Victoria-street, S.W. *Secretary.*

SOMERSET SURVEYORS' ASSOCIATION.

A meeting of the above association will be held at the council room, Williton, on the 18th inst., at 2 o'clock.

AGENDA.

(1) Minutes of the last meeting.
(2) Report of the Executive Committee (if any).
(3) Paper by Mr. Charles Durie on "Highway Administration in the Williton Rural District," and the Ackland Highway Act of 1885.

Lunch, 1 o'clock, at a convenient place adjoining (details not yet arranged).

Tea at close of the meeting

Mr. Jackman, building surveyor to the rural district council, has kindly promised to place on view two sets of plans of workmen's cottages proposed to be built for the rural council.

D. EDWARDS, ASSOC.M.INST.C.E.,
Hon. Secretary.

Taunton

Rubber Roadways and Floors.—In an address at the rubber exhibition which is being held in London Sir Henry Blake said he looked confidently to the substitution of rubber for wood in street paving, and that he anticipated rubber flooring for churches and public and private buildings on such a scale as would absorb all the rubber which could be produced either by Nature or art.

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangements well suited for easy reference.—*The Law Times.*

* A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities. By S. G. Turner, of the Middle Temple, Barrister-at-Law, A.M.I.C.E., &c. London: St. Bride's Press, Limited. Price 10s. 6d.

APPOINTMENTS VACANT.

Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

HEBDEN BRIDGE.—July 10th.—For repairs to schools, for the Education Committee.—Mr. F. J. MacDonald, Education Offices, Sowerby Bridge.

GLASGOW.—July 10th.—For the digging and removal of concrete work, at Dalmarnock Bridge new electricity station, for the corporation.—Mr. W. W. Luckie electrical engineer, 75 Waterloo-street.

WEST RIDING.—July 10th.—For the erection of a school, for the Education Committee.—Education Architect, County Hall, Wakefield.

CROYDON.—July 10th.—For the erection of a school, for the Education Committee.—Education Office, Katherine-street, Croydon.

NEWCASTLE-ON-TYNE.—July 10th.—For the erection of baths, for the corporation.—Property Surveyor, Town Hall.

MILFORD.—July 11th.—For building eleven cottages, for the rural district council.—Mr. S. Waters, clerk.

MIDLETON.—July 11th.—For the erection of twenty-five labourers' cottages, and for the completion of 193 other cottages, for the rural district council.—Mr. J. Stanton, clerk.

HALIFAX.—July 11th.—For the erection of a cable shed at electricity works, for the corporation.—Mr. J. Lord, borough engineer.

CORNWALL.—July 11th.—For the erection of a handicraft centre, for the Education Committee.—Mr. B. C. Andrew, architect, Biddick's-court, St. Austell.

SUNDERLAND.—July 11th.—For the erection of a training college and hostels, for the corporation.—Borough Surveyor.

HITCHIN.—July 13th.—For the erection of an isolation hospital, for the rural district council.—Mr. A. E. Passingham, clerk.

HAMPSHIRE.—July 13th.—For the extension of a school, for the county council.—Mr. A. L. Roberts, architect, The Castle, Winchester.

COVENTRY.—July 13th.—For the erection of two pump-houses at waterworks, for the corporation.—Mr. J. E. Swindlehurst, city engineer and surveyor.

BRIDGWATER.—July 13th.—For alterations and additions to school building, for the Higher Education Committee.—Messrs. Samson & Coltham-st, architects, 51 High-street, Bridgwater.

RATHDRUM.—July 13th.—For the erection of sixty-one cottages, for the rural district council.—Mr. P. W. Sheehan, clerk.

SALFORD.—July 13th.—For the supply of steel and concrete foundations, for the corporation.—Borough Electrical Engineer.

DUNDALK.—July 14th.—For the erection of forty-six houses and contingent works, for the urban district council.—Mr. M. Sellars, surveyor, Town Hall.

HAMPTON.—July 14th.—For the extension of the isolation hospital, for the urban district council.—Mr. S. H. Chambers, surveyor.

CROYDON.—July 14th.—For the erection of a covered steel shed, for the corporation.—Borough Engineer.

MIDLOTHIAN.—July 14th.—For alterations at Loanhead Hospital, for the county council.—Mr. A. Murray Hardie, architect, 20 George-street, Edinburgh.

HAMPSHIRE.—July 14th.—For additions to a school and drainage work, for the county council.—Mr. A. L. Roberts, architect, The Castle, Winchester.

BARKING.—July 14th.—For the erection of workmen's dwellings, for the urban district council.—Mr. C. J. Dawson, architect, Clock House Chambers, East-street, Barking.

EDINBURGH.—July 14th.—For the erection of a public convenience and scavengers' muster-room, for the corporation.—Mr. A. H. Campbell, burgh engineer.

CROYDON.—July 15th.—For alterations and additions to school, for the Education Committee.—Mr. J. Smyth, clerk, Education Office, Katherine-street, Croydon.

KESTEVEN.—July 15th.—For additions and alterations to schools, for the Education Committee.—Mr. H. Donaldson, County Education Office, Grantham.

HONLEY.—July 15th.—For the erection of new council offices, for the urban district council.—Messrs. J. Berry & Sons, architects, 3 Market-place Huddersfield.

CLITHEROE.—July 15th.—For the erection of twenty-six cottages, for the corporation.—Mr. A. R Bleazard, borough engineer.

LEEDS.—July 15th.—For constructional and paving works, for the Property Committee.—Mr. W. T. Lancashire, city engineer.

EXMOUTH.—July 16th.—For the supply and laying of 1,000 cast-iron pipes, sluice valves, 10-in. cast-iron pipe line, 8-in. steel pipe line, and other necessary works, for the urban district council.—Mr. S. Hutton, engineer and surveyor.

DURHAM.—July 17th.—For bridge widening, for the county council.—Mr. W. Crozier, county surveyor, Shire Hall, Durham.

WEST SUSSEX.—July 28th.—For the erection of a school at Horsham, for the Joint Education Committee.—Mr. Hadyn P. Roberts, education architect, Thurloe House, High-street, Worthing.

MADRAS CORPORATION, INDIA.

WANTED, ASSISTANT DRAINAGE ENGINEER.

The President, Corporation of Madras, invites applications for the appointment of Drainage Assistant to the Special Engineer, J. W. Madeley, Esq., M.A., M.INST.C.E., M.AM.SOC.C.E., &c.

The duties will be to assist the Special Engineer in the design, construction and maintenance of works of drainage for the City of Madras.

The salary will be Rs.300 (£23 0s. 8d.) per mensem, rising by annual increments of Rs.20 per mensem. An allowance of Rs.50 (£3 6s. 8d.) per mensem will be paid to the officer appointed so long as he maintains and uses on the work a motor-bicycle in good running order. No other allowance of any kind will be made.

Before sailing for Madras the successful candidate will be required to sign a three years' agreement to be prepared by the Corporation. By mutual consent the appointment may be extended for a further period.

The Corporation reserves the right to determine the appointment at any time by three months' notice in writing, or by payment of one month's salary.

The Officer appointed will be allowed ordinary first-class railway fares and second-class steamship passage to Madras, *viâ* Marseilles and Bombay, by P. and O. steamer. A like sum to return free passage will be granted on the termination of the appointment, subject to the satisfactory service according to the conditions of the agreement. Half-pay will be granted on the voyage out from the date of leaving England.

Leave will be granted on full pay to the extent of one month for every eleven months of active service, but for not more than three months at a time.

The applicant must not be more than 35 years old, and copies of certificates of age, testimonials and medical certificate of fitness for service in India, must be enclosed with the application, which must reach the undersigned not later than Thursday, 30th July. They will be sent out to Madras, where the final selection will be made by the President of the Corporation.

The President reserves the right of rejecting all applications without giving reasons.

The Officer appointed will be required to commence his duties in Madras not later than eight weeks after he has received notification of the acceptance of the application.

Applications must be in writing, and should be sent to the undersigned in envelopes superscribed "Drainage Assistant."

JAMES MANSERGH & SONS,
Agents to the Corporation of Madras.

5 Victoria-street,
Westminster, London, S.W.
July 7, 1914. (1,770)

BOROUGH SURVEYOR in the North of England is willing to take a Pupil in his Office. Excellent experience on important works about to be carried out. Moderate premium; 3 years' articles. Apply Box 1,141, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,776)

BOROUGH OF DORCHESTER.
Wanted, experienced General Foreman. Cyclist. Age 35-45. Only those having had experience in works of a local authority need apply. Canvassing will disqualify. Applications, in own handwriting, upon the prescribed Form, with copies of three recent testimonials, endorsed "Foreman," to be sent by the 25th July, 1914, to A. G. Symonds, Town Clerk, Dorchester. (1,767)

BOROUGH OF CHEPPING WYCOMBE.

The Town Council invite applications for the appointment of Clerk to the Borough Surveyor's Department.

Candidates must be Chartered Architects and Experts and have a good knowledge of accounts as kept in a Municipal Surveyor's Office. Salary £78 per annum.

Applications, stating age and qualifications, with not more than three recent testimonials, endorsed "Surveyor's Clerk," must be delivered to the undersigned not later than noon on Wednesday, the 22nd July, 1914.

Canvassing will be considered a disqualification.

T. J. RUSHBROOKE,
Borough Engineer and Surveyor.

2, Easton-street,
High Wycombe.
July 6, 1914. (1,774)

COUNTY OF CORNWALL.
APPOINTMENT OF COUNTY SURVEYOR.

The Cornwall County Council invite applications for the appointment of County Surveyor.

Applicants must be not less than 30 or more than 40 years of age.

The Council attach importance to applicants with experience in County Administration.

Salary £600 a year, increasing by £25 a year to £700.

Office and Staff will be provided, and all reasonable travelling expenses and other disbursements will be borne by the County Council.

The appointment will be during the pleasure of the Council, and be determinable by 3 months' notice on either side.

Applications must be accompanied by a statement of particulars as to previous service, &c., to be in the form of a Form which can be obtained from the undersigned, and be copies of not more than three recent testimonials.

Canvassing either directly or indirectly will be considered a disqualification, but candidates may send printed copies of their applications and testimonials to the members of the Higher Committee. A list of these can be obtained on application.

The person appointed will be required to devote the whole of his time to the duties of his office.

Applications must be sent in to the undersigned not later than the 31st instant.

Further particulars of the terms of the appointment can be obtained from the undersigned.

CHRISTOPHER L. COWLARD,
Clerk of the County Council.

Bodmin.
July 4, 1914. (1,765)

GREAT BERKHAMSTED URBAN DISTRICT COUNCIL.

The Council are prepared to receive applications from duly qualified persons for the appointment of a Sanitary Inspector and Surveyor, at a commencing salary of £250 (with office provided).

The person appointed will be required to reside in Berkhamsted, to devote his whole time to the duties of the office, and must not be more than 40 years of age.

Candidates must hold the certificate of competency in sanitary knowledge granted by the Sanitary Inspectors' Examination Board, or, prior to the 31st December, 1893, by the Sanitary Institute, and must possess practical experience of septic tanks and bacteria beds.

The appointment will be subject to the approval of the Local Government Board, and in accordance with the Sanitary Officers' (Outside London) Order, 1909, and will be subject to the resolutions and orders of the Council relating to Officers.

There will be no compensation or superannuation on retirement or loss of office.

Applications, accompanied by not more than three testimonials, must be made in candidate's own handwriting on Forms to be obtained at the Office, and delivered here not later than Friday, the 24th July, 1914.

Canvassing is prohibited.

The Surveyor

And Municipal and County Engineer.

Vol. XLVI. JULY 17, 1914. No. 1,174.

Minutes of Proceedings

The Life of Steel Pipes.

That a steel pipe should remain sound for an indefinite time is really not much more remarkable than that a lead pipe should, under certain conditions, be practically everlasting. We [illegible] Romans, but if these pipes had been subjected [illegible] depended not so much upon the excellence of the [illegible] quality of the water they contained and upon the quality of the material in which they were bedded. Similarly it ought to be possible to ensure that steel pipes are not brought into contact with [illegible] electrolytic action. It is shown by the chemist that waters can be so treated as to make them suitable for distribution in steel mains. We have instances of steel mains which have lasted longer than cast-iron pipes, and others where corrosion has ceased after treatment of the water. The prejudice against steel pipes, where it exists, is due to experience based upon the corrosion of steel when brought into contact with water of a certain quality. Seeing that waters vary in quality, and that the corrosive properties can be removed, it is very short-sighted policy to shut one's eyes to the advantages of the steel main.

The New York *Engineering Record* contains particulars of a steel pipe which has been found to be in good condition after seventeen years of service at New Bedford, Massachusetts. In the annual report of the superintendent of the water board the results of an inspection made recently are given. The main is 48 in. in diameter and 1,200 ft. long. Previous to its installation the comparative merits of steel and cast-iron pipe were the subject of much discussion by the water board, who were ultimately advised by their engineers to use steel pipe because the cost would be 28 per cent. less than that of the cast-iron pipe. The life of the main was then estimated to be twenty-five years, but those who have just examined it find it in excellent condition, and state that it is now easy to prophesy its useful life for many years exceeding the twenty-five-year limit. It is shown that the tubercules which existed in the steel main five years ago, and which ranged from three to seventy per square foot, have only increased since from [illegible] both the tubercules have not grown materially deeper, neither have the tubercules increased very greatly in size. In the cast-iron mains in the same district the tubercules have, on the other hand, increased considerably in size. The average depth [illegible] as 0·110 in., which is no deeper than one found five years ago. [illegible] Thus the extreme pitting scarcely exceeds one-third of the thickness of the steel in a pipe which has been in service for seventeen years.

It should be noted that the pipe is coated, and that the coating has blistered. These blisters [illegible] of rust found upon the steel beneath them, and the water held in the blisters is found to be of an alkaline nature. The condition of this main is, of course, by no means perfect. It does not show such a result as might be hoped for where the water has been treated specially in order to prevent corrosion, but it affords excellent evidence of the life of a coated steel main put in under ordinary conditions, and may tend to confirm the judgment of those who have decided to rely upon steel pipes.

* * *

The Road Board's Fourth Annual Report.

The Road Board's policy as regards the allotment of the Road Improvement Fund and the nature of the works for which grants and loans are made is steadily developing, and the fourth annual report shows [illegible] accomplished in the past financial year, and that important developments are taking place with the steady growth of the revenue allotted to road improvement. The report shows very clearly that the present administrative system in Ireland, involving an awkward and stupifying dual responsibility, is extremely unsatisfactory, and it is definitely recommended that the system shall be [illegible] at an early date. A bright ray of light has been thrown upon Irish administrative methods by the discovery that only about a quarter of the licence duties on motor

vehicles are collected in Ireland, and the board is naturally reluctant to make up the deficiency from the pockets of English and Scottish taxpayers. In Scotland the only serious difficulty with respect to applications for grants is one which is rather financial than administrative in character, and the board, quite justifiably, has in a number of cases contributed unusually large proportions of the cost of improvements on roads in Scotland.

With respect to the proportion of the funds which is to be allotted to Greater London, we believe that unbiassed opinion will strongly support the board's decision that the share of that area should not be more than that arrived at on a population basis. We are not so confident that the policy of the board is satisfactory as to grants to district roads. There is nothing unsound in the presentment of the case as regards finance, and the relief afforded to ratepayers. But that is not the whole story, and from the engineering point of view we should have welcomed an announcement to the effect that the board were making a beginning, in some favourable area, with the work of improving the road system from the other end. As regards the larger schemes for road improvement, on the other hand, we are very glad to learn that these now form so important a feature of the work of road improvement. We long ago pointed out that it was desirable to concentrate work, and to deal with considerable mileages at once with suitable staffs, and the schemes now announced are the more to be welcomed in that the relatively high average cost per mile shows that they are works of comprehensive improvement.

As to the widths of important main roads, the faddists will find a serious check to their ambitions in the announcement that the board do not encourage the widening of the metalled portion of the carriageways through rural areas beyond 18 ft., "as they are of opinion that this width is generally adequate for traffic purposes, except in the immediate vicinity of towns." Since the board favours "as much land as possible being secured between fences," their policy does not stand in the way of future widenings of carriageways, if necessary, and the country as a whole is greatly indebted to Sir George Gibb, to whom must be accorded the credit for having succeeded, in the face of considerable difficulties we believe, in giving effect to sound opinion in this matter. A summary of the main features of the report, with important passages quoted in full, will appear in next week's issue.

The Repair of Railway Bridges.

In our issue of March 27th last we commented upon the case of *Attorney-General* v. *Sharpness New Docks, &c., Company*, in which it was decided by the Court of Appeal that a canal company, whose special Act bound them to keep the bridges over their canal in "sufficient repair," must maintain them according to an "up to date" standard, sufficient to carry the traffic of the day. We pointed out that it was an interesting question whether the same principle would be applied to bridges carrying highways over railways. The liability of the canal company in this case was imposed by their special Act, which provided that they should maintain the bridges "in sufficient repair." The liability of railway companies is imposed by sec. 46 of the Railway Clauses Act, 1845, which binds a railway company simply to "maintain" the bridges (without the addition of the words "in sufficient repair"). But we suggested that it would be too nice a distinction to attempt to discriminate between the several liabilities entailed by these two different phrases. This view of the matter is confirmed by the recent case of *Attorney-General* v. *Great Northern Railway Company* (noted at page 1059, *ante*), in which Mr. Justice Warrington held that the obligation of the railway company with respect to a bridge carrying the highway over their line at Crouch End was to maintain the bridge in such a condition of safety that it would be sufficient for the passage of the traffic which might be expected upon it.

The main principles underlying both decisions, as set out in Mr. Justice Warrington's judgment, may be thus summarised: (1) Those who interrupt a highway, under statutory powers, for their own purposes, must construct and maintain the necessary works to restore the use of the highway to the public, unless the statute under which they are acting exempts them from such obligation; and (2) the standard of repair of such works (in this case a bridge) is to be measured by the obligation which rests upon the highway authority with respect to the highway of which the bridge forms part, or in other words it is to be determined by the nature and extent of the traffic upon and to be expected upon the highway of which the bridge forms part. Another important point decided by this case has reference to the effect of the Local Government Board regulations as to heavy motor traffic on bridges. These regulations, as our readers are aware, prohibit the use of heavy motor-cars on a bridge when the party liable for its repair affixes a notice that the bridge is insufficient for such traffic. The railway company had affixed such a notice in this case, and contended that this exempted them from liability to render the bridge safe for heavy motor vehicles. Mr. Justice Warrington, however, held that the true effect of the regulations was merely to enable the company to exclude heavy traffic while the bridge remained insufficient, and not to qualify their obligation to render it sufficient if and when heavy traffic might be expected on the highway.

Croydon's Relief Road: The Present Position.

In another part of this issue there will be found a sketch of the present position as regards the project for the provision of a relief road to take through traffic past Croydon. Some of the engineering features of the scheme were described in our issue of November 28, 1913, and attention may also be directed to an article on "By-pass Roads," by Mr. Reginald Rivers, M.CONS.E., in our issue of May 30, 1913, in which the subject is treated generally, but in a manner strongly suggestive of a solution of the present difficulty as regards Croydon. A difficulty there certainly is, since it can hardly be supposed that the view taken by the Local Government Board will be altered by the fact that the Road Board has promised an additional grant to cover the cost of a desirable work not included in the original estimate. The suggested solution is to reduce the whole cost of the scheme, as regards both construction and maintenance, by reducing it to a road scheme, doing away with all features connected with the development of the route as a main shopping thoroughfare. We can see no reason why a relief road should not pass between back gardens, or between the gardens of houses fronting side roads at right angles to the relief road. Such a road, with ample provision for the widening of the carriageway itself, could be made once for all of the full total width necessary, or likely to be necessary, and if in the future the traffic were to increase so much that widening became imperative, all concerned would indeed be thankful that the road was lined by gardens instead of by costly business premises.

Surely it is a mistake to reproduce on the new

near those very features which are responsible for the present congestion. The underlying idea in providing a relief road is to separate those who want to drive through or past Croydon from those who want to drive about in Croydon and leave their vehicles standing by the kerb. From this point of view, some of the strongest local advocates of the scheme are really giving their support to it on terms which will be far from satisfactory to the through traffic interests in the future. On the other hand, some of the opponents of the scheme might become supporters of a project for a by-pass road which could never become a shopping street. If Croydon needs developments of this kind to the west of the High-street, such developments could take place independently of the relief road. Several streets which lie in that area could be named as far more promising than the route of the proposed relief road, and their usefulness in this sense would be all the greater from the linking up provided by a road intended for traffic and not for local business. We commend these considerations, and the arguments set forth in Mr. Ryves' article, to the attention not only of those interested in the Croydon project, but also of all who are concerned with town planning or the provision of by-pass roads.

* * *

The Dog as an Urban Resident.

In a pithy paragraph under the heading "Things One Would Like to Know" in a recent issue our contributor brings forward a subject to which reference was made in these pages some years ago, and one which has now become of greater importance. He asks why it is that people will keep dogs in towns, and whether it would not have been a good plan to impose a tax of 10 guineas a year on people who own dogs in any town of more than 20,000 inhabitants. Now some of these animals are kept by lonely persons who value them as companions, being too poor, or too stupid, to take the responsibility of adopting children instead; and some are kept as watch-dogs. But most of them are owned by persons who value them merely as additions to the interest of life, and because they like some of their possessions to be alive, and capable of producing incidents spontaneously.

The presence of these animals in large numbers is, however, a source of much inconvenience to the public, and possibly of some unconsidered and obscure dangers to health. In many residential areas the dogs' contributions to night noises are frequent and violent. But a more serious nuisance, to many minds, and one which is felt by all refined persons, is the filthiness of footways and of shop and house fronts, resulting from the presence of a large number of dogs in an urban or suburban area. In suggesting that a special tax should be imposed on town dogs our contributor revives an idea put forward by Mr. Reginald Brown in a paper read before the Royal Sanitary Institute in 1908. Mr. Brown then suggested that owners of dogs should pay an increased licence to cover the cost of special scavenging. At that time the nuisance was not so serious as it is now, and while we did not oppose Mr. Brown's view, we did not definitely support it. Moreover, his case was weakened, and indeed almost destroyed, by his including in his indictment the cat, which led us to observe, in our issue of August 14, 1908, that this animal is one "which for cleanliness in the matter of sewage disposal is an object-lesson to the world." We supported Mr. Brown's views in the matter of the prevention of the practice of depositing sweepings on public thoroughfares, and that of spitting, and, since all these things hang together, we are now disposed to support the enforcing of suitable means of checking the nuisance of filth caused by dogs—if any such measures can be practically framed.

* * *

The Sanitary Institute at Blackpool.

Last week we made some reference to the conference of engineers and surveyors which was held in connection with the recent congress of the Royal Sanitary Institute at Blackpool, and we were then able to give a full report of the address delivered by Mr. J. S. Brodie, who presided. Following upon this address the conference discussed three interesting papers, some account of which will be found in another column. The first of these was read by Mr. T. G. Lumb, ASSOC.M.INST.C.E., and dealt with "Town Planning and Garden Cities." The discussion showed that the meeting generally agreed with the main principles laid down by Mr. Lumb, the only point of criticism arising on a statement in the paper that "up to the present little or nothing has been done by local authorities in the matter of town planning, even with all the advantages gained by the adoption of the Act." In regard to this matter we are bound to say that we agree with Mr. Willis, who, in moving a vote of thanks to the author of the paper, expressed the opinion that, considering the difficulties which have had to be overcome, very great progress has been made. The second paper on "The Sanitary Side of Town Planning" was submitted by Mr. A. J. Price, ASSOC.M.INST.C.E., of Eccles, and we cordially agree with the chairman in congratulating the conference on having a young member to bring forward a paper of such excellence. The paper may perhaps best be described as a plea for sanitary foresight, so that new districts may have the benefit of the most up-to-date methods, which are in many cases impossible in built up areas on the ground of expense. For example, Mr. Price advocated pipe subways, the collection of house refuse by a pneumatic system, and the provision of ample open spaces. The last paper was presented by Mr. J. W. Hipwood, the borough engineer and surveyor of Morecambe, who took as his subject "Seaside Amenities." The importance of the maintenance of the full amenities of a seaside resort is obvious, and Mr. Hipwood duly laid emphasis on the more important points to be observed.

* *

Sewage Managers at Norwich.

The annual general summer meeting of the Association of Managers of Sewage Disposal Works is an event which must not be allowed to pass without some notice. The association is one which may not be very much in the public eye, but it is doing very useful work in connection with one of the most important of the municipal services affecting the public health. The meeting this year took place at Norwich, where the members were officially welcomed by the Lord Mayor, who, in opening the proceedings, referred to the possibility which the future held of converting sewage into manure on commercial lines. In reply, Dr. Bostock Hill, the president of the association, pointed out that the whole science of bacteriology is of very recent growth, and that as greater knowledge of the habits and functions of the various micro-organisms is attained, more will, no doubt, be possible in the direction indicated. The meeting was privileged to hear a description by Mr. A. E. Collins of the system of sewage treatment adopted by the Norwich Corporation, and subsequently a visit was paid to the works. A keen interest was evinced by those present in the whole of the proceedings, and those responsible for the organisation are to be congratulated on a thoroughly successful meeting.

Grouting and Penetrating Methods of Road Surfaces.*

By [illegible] Engineer.

[illegible] some [illegible] road [illegible] the somewhat thankless duty of making roads for the [illegible].

It would not be out of place, and it might be helpful in [illegible] which the road maker is bound to consider, and which not thoroughly appreciate. . . .

[illegible] the gradients are exceptionally steep, with sufficient foothold for horses, and in frosty and muddy weather when the surfaces are greasy, an adequate supply of grit must be at hand. At the same time, these surfaces should be kept waterproof and as free from mud and dust as possible on account of the ever-increasing motor traffic. If motor traffic was all of one kind, a well tarred, sprayed, macadam would meet the case in many areas and for many miles of roads; but this traffic again is divided into various classes—*e.g.*, heavy motors, light motors, vehicles driven by steam with broad rough tyres and heavy [illegible].

These various kinds of traffic require special and [illegible] factory condition.

This paper does not deal with main roads or county roads, but more particularly with secondary roads in towns and suburbs, which, at the same time, have considerable traffic, and occasionally are liable to have to carry all sorts and conditions of vehicles and tractors.

From a maintenance point of view it has been found that one of the most difficult roads to keep in good condition is the level road, which, on account of its want of proper longitudinal fall, particularly in wet weather, absorbs a large amount of moisture. Even a waterproofed road is more or less liable, partly owing to its position, to retain moisture in its foundations or in the subsoil if the district around is of a low-lying insufficiently drained character.

A [illegible] cleansing with every shower of rain, and has a chance of a much longer life, in addition to being more easily kept clean and in a satisfactory condition. The margins of roads where tram lines are in the centre will not be dealt with. These have caused enough anxiety, and will continue to do so, to their surveyors as long as tram lines exist, and must always require more or less special treatment. Another reason for calling particular attention to the grouting and penetrating methods is the great difficulty, which it is believed is not uncommon, experienced in obtaining the necessary supplies of tarred road materials of various kinds in the quantity and at the times when they are most urgently needed.

One frequently has the misfortune to have a long and important road undergoing reconstruction, and to be hampered and harassed with the difficulty of obtaining a sufficient quantity of these materials to continue and complete the work in anything like a reasonable time.

All these difficulties make it desirable and necessary for road makers to have more than one string to their [illegible] bow, and to [illegible] when emergencies of this nature occur, in order to [illegible] and [illegible] able time with as little inconvenience to the public as possible.

Two points that road engineers have to deal with must be emphasised: Road surfaces must not only be able to stand the suction which is the result of rapid motor traffic, with indiarubber tyres, which removes the dust, grit, sand, mud and water out of the water-bound roads, and sooner or later the small and then the larger stones themselves as they become loosened by disintegration, but consideration must be given to the provision of surfaces which will withstand the vibration from heavy vehicles—horse drawn, steam driven, and otherwise—which, with the continual hammering of the horses' hoofs and the solid iron tyres, often shake the crust of the road and also its foundations.

[illegible] long under all these conditions. If the traffic were uniform, the problem would be simpler, and less expensive methods might be more easily adopted. All these points have to be considered in the construction or reconstruction of any road, and, as a rule, a road [illegible] will be able to withstand all these conditions in a thoroughly satisfactory manner.

So far, difficulties common to all road engineers have been dealt with, among which that of an adequate supply of materials is by no means the least at the present time.

It no doubt arises largely from the fact that tarred materials of one sort or another have been recognised as one of the chief and best methods of road making, and road authorities—county, urban and rural—are all, without exception, making great efforts to meet the road problem of the day, and partly also on account of the fact that tarred materials can best be laid in dry weather, as most of these new surfaces and reconstruction of roads are done in the few months in the summer which can be relied upon as most suitable for this purpose.

If anyone can discover a material which can be used as satisfactorily in wet weather as in fine, or in winter as easily as in summer, no difficulty would be found in obtaining a ready sale for it.

It seems almost superfluous to reiterate here the [illegible] ADVANTAGE [illegible] SPRAYING on well-constructed macadam roads. Most engineers have found that this is of immense advantage not only in the prevention of dust and mud in main roads subject to heavy and rapid traffic, but also that it adds considerably to the life of those roads, and is a distinct advantage from a health point of view in second-rate residential roads made of macadam in which many of the poor in our towns have to live. These streets often swarm with children who use them as their chief playgrounds. The sanitary advantage of tar-spraying in these roads can hardly be overestimated.

Leaving the difficulties of the situation generally, [illegible] proper foundations and good drainage to all roads which are to be treated with waterproof surfaces and have to bear heavy traffic. Many roads which have for years been subject to heavy traffic have been found to consist almost entirely of a number of coats of macadam laid one upon the top of the other, the whole mass resting on a clay underbed without foundation or drainage of any kind. It is impossible for roads constructed on such lines to last, and in such cases the old macadam has invariably had to be removed, and below that, to the required depth, the surplus soil excavated and removed, and in its place a foundation of 6-in. or 8-in. slag pitchers laid upon a properly formed and well-rolled bed consisting of several inches of rough, hard clinker. The advantage of this layer of clinker is to prevent the clay or underbed working through the pitchers towards the surface, and consequently causing the foundation to give way and become uneven. This usually forms an excellent drainage, and remains of lasting benefit to the newly constructed road. Upon this foundation several types of grouting or penetrating methods have been tried, the first which naturally suggested itself being that of ordinary tar. The first trial of this kind was made some five or six years ago on a road which had a natural and suffi-

* Paper read at the annual meeting of the Institution of Municipal and County Engineers at Cheltenham

grit to spread upon the top. This road surface, which is subject to a fair amount of traffic of various kinds, repairs.

This class of road, provided it is constructed in very little more costly than ordinary water-bound follow the commencement of the work, completion surface, in others there have been less satisfactory case was laid in two coats; the first coat was treated similarly to the one made of slag referred to above, and after it had been thoroughly grouted and rolled in, a second coat, one stone thick, of basalt was laid upon the top, and the process repeated with Plascom and chippings until the final surface was finished.

its life cannot be estimated. The carriageway is narrow, the surface is a level one, with hardly any gradient, and the traffic of a heavy nature, mostly with iron tyres, such as railway drays and vehicles of that kind. The surface to-day is almost as good as when it was laid down, but time alone can say how long it will last. Ordinary water-bound macadam in this road only lasts a year.

Roads grouted with Rocmac and with Glutrin have also been laid in an experimental manner, also with various results, but the latter experiments, made about twelve months ago, when the materials in both cases were mixed on boards in the form of concrete, have been much more satisfactory, and promise to make a more lasting surface, and one which affords at the same time a most excellent foothold for horses. The great advantage of these two materials is that they may be laid in wet weather even better than in fine weather, and consequently the work is not interrupted for any outside causes, as is the case with tar roads sometimes.

Plascom, Rocmac and Glutrin are more costly than Tarmac in the first instance, but the length of life has so far not been sufficient for a proper comparison.

Beyond the fact that Rocmac and Glutrin grouted much better foothold for horses. A coat of tar dressing in the summer will prevent them being dusty, and add to the length of life generally.

A road was formed and treated with Bituvia on similar lines to Plascom and tar grout, and this, although only a year old, is also in good condition, and promises a fair life in the future.

There may be other forms of grouted roads equally good and useful, but there is still room for further progress in this direction, and the inventor, if the method be not an expensive one, might easily make a fortune. Most engineers would be glad to have a longer period, extending through the winter, in which to continue their road work, especially as sometimes it is difficult to find sufficient employment for all their good and useful men during the winter months when

Essex Main Roads Reconstruction.—At a meeting of the Essex County Council at Chelmsford last week a general scheme of main road reconstruction, to be carried out in five years, was adopted.

PUBLIC SWIMMING BATHS WATER.

CONTINUOUS AERATION AND FILTRATION.

Mr. R. A. Blakeborough (Brighouse) being prevented from attending the recent meeting of the Institution of Water Engineers at Stockport at which Mr. L. Holme Lewis (Manchester) read a of the Water of Public Swimming Baths," submitted the following observations in writing:—

"While the author's paper is an interesting account of the early development of this system, his remarks refer entirely to the one process of which he has evidently had considerable experience. Within recent years, however, considerable advancements have been made in the purification of bath water, with corresponding improved results, of which tion of any members who may be interested in this subject I desire to briefly call attention to these developments. The principal addition to the process applied by Mr. B. Bramwell, M.I.MECH.E., in the patent 'Turnover' filter. The system was first by Mr. Bramwell on the subject before the Royal Sanitary Institute at their summer meeting in Belfast in 1911. Since then a number of baths have been equipped with the system, and the results have been satisfactory beyond all expectation. Although efficient aëration is considered a necessary part of the treatment, the chemical treatment is, in my opinion, an equally, if not a more, important factor, for by it not only is a much brighter and clearer water produced, but any colour in the water is much more quickly eliminated, and, what is of still greater importance, the bacteriological purity of the filtered water is unquestionable. The chemicals used are the same as are in use all over the world for the purification of drinking water for the supply of towns, and are absolutely harmless. The treatment has a powerful germicidal action, eliminating all traces of bacteria associated with sewage or fæcal pollution, as well as those associated with disease. Water taken from a swimming pond which had not been emptied or refilled during the six months from May to October of last year, and in which thousands of people bathed, was pronounced by F. W. Richardson, Esq., F.I.C., county analyst, Bradford, as being quite passable for drinking purposes. This water had been purified continuously during the whole period by the plant referred to above, without any overtime or night work being necessary."

Replying to Mr. Blakeborough's communication, Mr. Lewis writes:

"I am unable to agree with his claim that chemical treatment is more important than aëration in the purification of the water of public baths. Aëration and filtration are indispensable parts of the scheme, but not so chemical treatment. While the experiments described in the paper were being carried out the use of chemical reagents to aid the process of purification received careful consideration, and, as indicated in the paper, it was concluded that it was undesirable to resort to chemical treatment provided satisfactory results could be otherwise obtained. That this is practicable is proved beyond doubt by the bacteriological and chemical analyses submitted with the paper. One might be led to suppose from Mr. Blakeborough's remarks that the use of aluminoferric or other reagents restricts the choice of filter to the 'Turnover' type. That, of course, is not the case. The use of aluminoferric for the purification of public bath water can also be applied in connection with Mr. Row's system, but my experience is decidedly opposed to chemical treatment. Not only does it involve the expenditure of more water for flushing the filters, and add to the cost of working, but it has the effect of coagulating the fatty matter given off by the human body which has a tendency to rise to the surface of the water in the bath, and is very disagreeable to the touch."

Town Planning Schemes.—It is understood that the Local Government Board has given authority for the preparation of five further town planning schemes under the Housing, Town Planning, &c., Act, 1909. The schemes are authorised to be prepared by the Corporations of Huddersfield and Tynemouth, and the Urban District Council of Barnet. In the case of Huddersfield three schemes are authorised.

Royal Sanitary Institute Congress at Blackpool.

CONFERENCE OF ENGINEERS AND SURVEYORS.

[illegible]

TOWN PLANNING AND GARDEN CITIES.

Mr. Lumb observed that up to the present little or nothing had been done by local authorities in the matter of town planning, even with all the advantages gained by the last piece of the Act. New roads where traffic is likely to increase, ought to be designed on liberal lines, especially in and around seaside resorts. In towns and cities where there were ground landlords, and if the laying out was in capable hands, there were possibilities of a most satisfactory scheme being evolved without the adoption of the Act; but in cases where an area was under one control, very often the desire to extract the maximum profit ended in a failure and a sacrifice of property. In the case of the individual owner he not unnaturally laid out his own land to obtain the maximum amount of profit, and to enable him to use every yard possible for building purposes, and often from the very selfish desire to shut out the neighbouring owner where possible from convenient access to the centre of the town, causing serious inconvenience and expense to the community. This had been done, unfortunately, in most towns, and if the authorities did not take immediate steps to alter this state of affairs the suburban developments would be ruined. Towns, with few exceptions, developed on commercial lines and in a piecemeal manner, and if local authorities concentrated their efforts on obtaining fine trunk roads they could safely leave the individual owner to lay out his own land. A reasonable proposition would be for the corporation to make the trunk roads of sufficient width, the landowner to give the land necessary for the construction of an ordinary statutory road. The corporation should not lodge a claim for betterment, nor the landowner any claim for compensation. Also surveyors of local authorities should not lose sight of the fact that it was very desirable to cordially co-operate with the landlords and their advisers.

Mr. E. Willis (Chiswick), in moving a vote of thanks to the author, said he did not quite agree with the sentence that very little had been done up to the present day in connection with town planning. Considering the difficulties which had to be overcome, he considered that a very great deal had been done. Throughout the country many local authorities had passed resolutions in regard to the matter, although he agreed that was only the commencement of the difficulty. The serious difficulty undoubtedly was to bring the various owners into line so that the whole scheme might be completed. He was a strong believer that town planning should be compulsory. He did not suggest that they should plan the whole of England with streets, but he did feel that the onus of guarding the amenities of their districts should be thrown on every local authority throughout the United Kingdom. When that was realised local authorities would not be slow to avail themselves of the opportunities offered to them. If some fiat from the Government could go forward that the main lines of streets should be set out, and districts covered by the provisions of a town planning scheme, then they would be able to prevent a large district being spoilt owing to the owner of a few acres allowing a factory for an offensive trade to be erected.

Mr. C. J. Jenkin (Finchley) said that, in connection with arterial roads, Mr. H. Samuel had outlined the possibility of town planning being compulsory for the whole of England. It would not mean that the actual setting out of towns should be put down on paper, but it would mean that the development of towns on wrong lines would be stopped, and if they could stop development on wrong lines the development would probably go on on better lines.

Mr. Gregson (Southport) remarked that town planning, after all, reduced itself in the end to a question of finance, and high land values were not [illegible] also to the fact that he was doing his duty in attending to the well-being of the community.

Mr. J. Munce (Belfast) thought that if those responsible for town planning tried to avoid the terrible [illegible] they would earn the gratitude of those who came after them. For the last fifty years the roads in Belfast had been laid [illegible] to good planning, but the difficulty in all places was that the man with one field thought his was the best field in the country, and wanted to lay it out to suit himself.

Mr. Lumb, in reply, said he quite agreed that, to a certain limited extent, town planning should be compulsory. From the surveyor's point of view he thought the limited extent should be that they should get the arterial roads definitely fixed in the outlying districts before the small owner began to develop in his own way. Their experience was like that of Mr. Munce, that every owner thought his field was the best.

Mr. Alfred J. Price, Assoc.M.Inst.C.E., Eccles, next submitted a paper on

THE SANITARY SIDE OF TOWN PLANNING.

Town planning (said the author) was now generally admitted to be necessary, and a wise policy for even the smallest districts to prevent them from becoming slums in the future. Every town council should be compelled to prepare a town plan for their district, on which should be laid out the main arterial roads, the various areas reserved for civic, commercial, industrial and residential purposes, with the number of houses allowed on the different residential areas, widths of the main and secondary roads, and the sites to be reserved for parks, open spaces and recreation grounds.

The water supply and sewerage systems, with the positions of the waterworks and pipes for distribution, and the sewers, outfall and sewage disposal works, should have their main lines and positions settled with due regard to future requirements, and the safeguarding of the health of the inhabitants of the district. The method of sewering, whether separate, combined or partially separate systems, and the dealing with surface and storm water, should also be determined. The lines and contours of streets influenced the lines, sizes and gradients of the sewers, and *vice versâ*. If a comprehensive plan had been prepared of the whole district, some towns which now had to pump the sewage might have effected a considerable saving by adopting a gravitation scheme.

The general lay-out of a town called for careful judgment in locating the various portions for civic, commercial, industrial and residential purposes. All factories should be confined to one quarter, and situated so that the prevailing winds blow the smoke away from the residential and commercial areas. Factory workers desired to live near their work, and a number of cottages should be built near the factories, although with the introduction of cheap tram fares there was a growing tendency for workers to live somewhat further away from the factories, in areas where land and cottages were cheaper, and the atmosphere purer.

The present costly, tedious and insanitary methods of scavenging by the social wreckage of our large towns should be superseded by the motor-driven sweeping and watering machine with its automatic collecting tank.

The house-to-house collection of refuse, with its untidy and unsightly littering of streets, should be superseded by a more sanitary, convenient and efficient method—viz., a pneumatic system of collection, by which the refuse emptied into a hopper at each house would be drawn through pipes by vacuum pumps, or blown through by air compressors to a refuse destructor, where it would be fed, without handling, into the furnaces, thus providing part of the power required to work the pumps or compressors.

and saving a large amount of money spent on manual and team labour.

The nuisance caused by frequent opening of streets for repairing sewers, and gas, water and other pipes, should be avoided by the provision of subways to accommodate all underground pipes and cables.

Streets should be made wide enough for future requirements, be direct, and have easy gradients, and while main arterial roads should be made wider than at present, residential streets might be made narrower so long as the distance between the houses was not less than 50 ft. or 60 ft.

Variable construction of road making should be adopted for the different classes of streets instead of the one general by-law method. Wide radial and ring roads gave convenient access from the out-skirts to the centre, and acted as lungs. The streets should be planted with trees, as far as possible, so as to relieve the monotonous and depressing appearance of streets.

The provision of suitable and sanitary cottages at a reasonable rent was a pressing need in both urban and rural districts.

The provision of open spaces, around which should be built the chief civic buildings of the district, of public parks overlooked by hospitals or sanatoria, and of recreation grounds near the schools and in the industrial areas was essential for the health of the people, and should form one of the chief features of every town plan. Open-air and covered swimming baths, football and cricket grounds, tennis courts, bowling greens and gymnasia should also be provided.

The CHAIRMAN (Mr. J. S. Brodie) proposed a vote of thanks to the author, and congratulated the institute on having a young member coming forward with a paper of value.

Mr. E. G. MAWBEY (Leicester), who seconded the motion, said that some people considered there was great difficulty in commencing a scheme of town planning, but the first step was really very simple. The late Mr. Alderman Thompson, a few days before his death, pointed out that, unless local authorities were prepared to relax their by-laws to give facilities for town planning, they could not get on as they should. If they wanted wide roads they would have to give something to the landowner, and if they did contribute to the cost, they would get it back in the way of health in the district.

Mr. J. MUNCE (Belfast) said he believed that every local authority should be compelled to prepare a scheme of town planning, and there should be a penalty for those who did not do so. But when a scheme had been prepared there should be some way of altering it if experience showed the necessity of doing so. He did not agree with all the factories being put in one place; in Belfast it certainly would not do to put the linen factories alongside the foundries and the shipbuilding yards. He did not agree with the author on the question of subways; 95 per cent of the openings in new streets were not for pipes which could be laid in subways, but were for pipes connecting to houses, and they could not have a subway to every house. As to the height of buildings in Belfast, no building could be higher than the width of the street without the consent of the corporation.

Mr. E. WILLIS (Chiswick) considered that, where a road was essentially an arterial road, a great deal, or the whole, of the cost should be borne by the State. In all town planning schemes there should be a provision that the elevation of buildings should be submitted to the local authority for their approval.

Mr. A. RACE (Barrow) pointed out that, owing to the foresight shown in the development of that town, they had little need for town planning, and they had many of the powers which had been suggested, including jurisdiction over the elevation of the houses in many thoroughfares.

Mr. MEASHAM LEE (Karachi) remarked that in his district the local authority owned 72 out of 75 square miles; but even in such a case the problem of providing amenities was real and vital.

Mr. W. STUBBS (Blackburn) said there seemed to be a sort of general idea that the better-class dwellings should be put in one district, the working-class in another, and the mills in another. Coming from a cotton-manufacturing town he thought that was a mistake. Seeing how electricity was coming into general use as the motive power, he saw no reason why houses for the working classes should not be erected in close proximity to the mills.

Mr. PRICE, in reply, said he quite agreed that they could not expect the landowner to give a small number of houses to the acre unless they cheapened development by allowing cheaper roads. With regard to Mr. Munce's point as to alterations of a town planning scheme, he suggested that a scheme should remain in force for a certain number of years, and then come up for amendment if necessary. When he referred to subways he meant that they should be constructed in the main shopping thoroughfares, where there was a lot of traffic. In regard to the situation of factories, his view was those of a more offensive character should be placed together. On a recent visit to Rouen he saw they had planted the gasworks on an island, and it was so surrounded by trees that one had to go up a hill to see it.

The subject of the next paper presented by Mr. J. W. Hipwood, borough engineer and surveyor of Morecambe, was

SEASIDE AMENITIES.

Mr. Hipwood said that in a health resort the elimination, or at any rate the reduction to a minimum, of unnecessary noises was one of the first essentials to be aimed at. In the matter of road making much could be done in the selection or improvement of road surfaces, so that the minimum of noise was experienced. Among the primary requirements was that of spaciousness, which included the provision of wide open spaces, promenades or boulevards. A promenade was to a health resort what a shop window was to a business, and the town's success was often judged accordingly.

One frequently noticed what would otherwise be a pleasing vista disfigured by notice boards, time tables, placards, or other bill-posting stations of various description, and their grouping or transference to a more appropriate position could generally be arranged to the mutual advantage of all.

In the selection of seating for promenades a vast improvement in the effect could be obtained by the fixing of garden seating or furniture of good design, instead of those having the iron scroll arms at the end and the usual plank seating. It was very desirable also for all shelters to have accommodation suitable for use in wet or windy weather, whatever the direction of the wind.

As regarded bandstands, it was essential to provide sufficient shelter from the elements to ensure comfort and health for the performers. The most effective and simplest method known to the author was the provision of sliding screens, which were made in narrow sections and hung to run on an overhead track running round the outer edge of the ceiling and with a track guide round the floor of the bandstand. If the upper two-thirds of the screen was glazed there was very little interference with the view.

The planting of all streets wherever possible with street trees exercised a more favourable, though probably unconscious, influence upon the visitors than in any improvements of much greater magnitude and expense.

In Morecambe the trees which had proved most successful were wych elm, Cornish elm, lime, sycamore, and Lombardy poplar.

It was, of course, a *sine qua non* for a seaside resort to possess a sewerage system above suspicion, and no effort should be spared to prevent any complaint arising either from house drainage or sewers or sewage disposal works. The daily collection of house refuse in properly covered, low-bodied refuse carts was also of primary importance in a seaside town during the season.

In the matter of roads, tar-macadam or wood-block roads would lead in popularity for promenade and main street work as affording freedom from dust or noise, but tar-sprayed and well-drained granite roads followed quickly after as a cheaper and efficient substitute. For the purpose of rendering any roads dustless, where the cost of tar-spraying was too great, the author had used for some few seasons a patented compound which acted as a germicide, and could be applied with an ordinary water-cart. It consisted chiefly of rosin, caustic soda, creosote, and pitch. The roads were treated once a week with 5 per cent solution mixed with water, reduced to 2½ per cent after the first few applications, when the road surface would be found to have been strengthened by the treatment and to have a tar-sprayed appearance.

Among the more important items was the plentiful provision of public lavatories or underground con-

out any extra cost in the water bill.

side public property, it was well to mention the in-

effects could be obtained by their use for all coats except the first. Green, gold, ivory, cream, or white always pleased the eye, and if employed in simple colour schemes satisfactory results would ensue. Enamelled or varnished finishing coats proved a decided economy in the long run, and retained their freshness a much longer time than an ordinary coat.

opinion.

thanks to the author, said that, in regard to pavements, he considered that at the present day the chief trouble was rather with noise than with dust. He thought there should be something done in the way of compelling all vehicles to undergo a test before they were put on the roads.

said the great thing in planting trees in seaside towns was to give the trees adequate protection. He thought that formal planning of gardens on the front

ful, for if they attempted to imitate Nature the whole thing was a sham, and people saw it. Band-stands, he considered, should be kept as simple as possible, and they did not want so much ornament as some of the manufacturers put on the market.

Mr. T. G. Lumb (Blackpool) remarked that if the visitors came in the autumn and saw some of the storms they had to contend with they would quite realise the difficulty of tree planting.

Mr. A. Race (Barrow) said that what pleased him about the works at Morecambe was that, besides being works of great utility, they had been carried out in real good taste. This was a side of the work which was of great importance in all towns, and particularly in seaside and other holiday resorts, but was one which the municipal engineer sometimes neglected.

(To be continued.)

Claridge's Asphalte is specified for the covering of roofs to the new Sheffield Telegraph offices in Sheffield.

Preliminary Studies in Bridge Design.—This little book,* a reprint of articles which appeared in The Surveyor and Municipal and County Engineer, is intended as the first of a series of similar volumes which, taken together, will form a treatise on the design of ordinary highway bridges of moderate spans. This first volume goes further back in the evolution of the bridge than do most treatises, and considers the bridge in its essential elements, that is as the means of providing a crossing for man and beast across a watercourse. The bridge engineer is apt to forget this primary purpose and to consider his bridge merely as a framework or a carrier of stresses. Mr. Ryves, in a refreshingly original manner, has emphasised the necessity for studying natural and economic predispositions, one might say, of the bridge site, with a view toward producing, not the best type of bridge, but the best method of getting the river and the traffic across one another. . . . —*Engineering News*, New York.

ECONOMICAL SUPPLY OF HOT WATER TO ARTISANS' DWELLINGS.*

bedrooms, kitchen, scullery and bath-room combined,

electric light, at a rent of 6s. per week, or, say, £15 10s. per annum (not including rates).

In the kitchen is fixed a range of flues communicating with the copper, built directly at back in the scullery in the usual way. Between the copper and

heat when not required for the heating of the copper. The usual copper furnace door and frame is fixed; in front of this is an airtight door and frame; by this means the copper furnace is made airtight. When the copper is required for washing purposes this door is removed, and the copper used in the usual manner. There are also three soot doors. These give access to any part of the copper flues for cleaning purposes

using gunpowder.

The copper is provided with a cold supply, entering near the bottom, connected direct to main supply, and controlled by a stopcock, an open draw-off being fixed close to the top and continued over the bath, the connections to the copper being easily detached to allow for removal of copper if required without disturbing the brick or other pipes.

The bath is an ordinary 5-ft. (Sienna) roll-top, with brass trap and outlet, the waste being carried to the same outside gully as the sink pipe, all properly trapped. The bath is covered with a door or lid hinged to the wall, so that when the bath is not required for bathing purposes it is let down, and forms a seat or table for the washing tub or tray. The front of the bath is open so that it can be kept clean, and

feet, and can be drawn out when required for bathing

Having so far described the installation, let us see the result. The stopcock was turned on, copper filled, range fire lighted, airtight door placed in position, the horizontal damper lifted. The heat from the range then passed through the flue at back and circulated round the flue of the copper, thence up the chimney, and in less than forty minutes the water was quite hot, although the brickwork in copper and range was quite cold and new. The 10 gallons of water were, in fact, quite hot enough to give one a bath. The next day, after the fire had been working and the cooking done and damper again opened, the water was raised to almost boiling-point in a very short time. . . . This was obtained from the surplus heat, or heat that would have been passing up the back of range flues instead of, as in this case, circulating round the copper and giving the household that which is of all importance—hot water at a minimum cost.

found to be quite hot enough for a bath, although it had been standing during the night.

I daresay some of my critics will say: "But what about the copper? It will in time burn out." So do boilers; they also furr up. So do cisterns, tanks, and all taps and pipes. Why do coppers burn out? Builders and property owners know full well. The cause is not keeping the copper properly filled with water, and the portion above the average water line deteriorates; but by the system here described it will be seen that the copper always stands full of water, and the supply of hot water can only be obtained by turning on the stopcock and running in the cold water at the bottom. This raises the hot water, which then flows out of the top pipe into the bath.

I venture to say, as a practical man, that the life

three times longer than under the ordinary conditions. Another great advantage claimed for this system is

the Association of Engineers of the Royal

CONTROL, MANAGEMENT AND MAINTENANCE OF RURAL ROADS.

To the Editor of THE SURVEYOR.

SIR,—Will you kindly allow me some space in which to reply to the paper by Mr. [illegible] Hawkins, county surveyor of Berkshire, read at the January meeting of the Incorporated Association of County Engineers at Cheltenham, and which appeared, together with a report of the ensuing discussion, in your last issue?

It is quite evident that Mr. Hawkins has satisfied himself that the only chance of salvation for the road and the ratepayer is that they should be bound hand and foot and delivered over to the county council and its surveyor.

"The ability, the enthusiasm, the energy, the element of public-mindedness and patriotism" taking their share of duty to their country. . . . It would appear that most county councils are now alive to the growing needs of localities, and, with the assistance and guidance of the Road Board, they seem to be the natural authority for dealing with all such matters as road management. . . . Those who have efficiently carried out a system of direct management on their main roads could without much trouble design and carry out a system for repairs to all roads on contract, and there is little doubt that all ratepayers would benefit by it. . . . The writer does not put forward any present county scheme as ideal for the movement" —so that for the present the rural district councillor and the rural surveyor are allowed breathing time. When Mr. Hawkins finally decides on the best course to pursue, no doubt both specimens will immediately disappear.

I hold no brief for any rural district council or for any rural district councillor; the latter, as I know him, is a gentleman well able to take care of himself. It may, Sir, and may not be as the best interests of the road and the ratepayer that all roads should be directly controlled and maintained by the county councils, but surely, Sir, the case for the affirmative does not need bolstering in this fashion by one of the junior county surveyors!

Then, again, you report Mr. E. P. Hooley in the discussion: "They knew what rural councils meant. They knew the position of the rural surveyor, who was very much like a toad under a harrow." This is generalising with a vengeance. Just a word as to my own experience as rural surveyor—one of the toads under the harrow!

I was appointed surveyor to the rural district council of Andover in 1897, at which time and until 1912 the main roads were maintained by the rural council under contract with the county council. In 1899 the Andover Rural District Council commenced to use granite on some of their district roads. I have before me a copy of a letter, dated March, 1900, addressed by the Andover Rural District Council to the Hants County Council recommending the use of granite on some of the main roads within the Andover area on the ground that the use of local material on these roads was no longer economical. Granite was not used on the main roads in this district until 1902. The Andover Rural District Council, since 1897, have built eight steel girder and concrete bridges, restored and strengthened numerous other bridges, and have spent upwards of £1,500 on hauling and rolling plant. During this period I have not had a single recommendation refused. So much for the "toad under the harrow" theory.—Yours, &c.,

JOHN WORMALD.

Andover.

ROAD TERMINOLOGY.

To the Editor of THE SURVEYOR.

SIR,—As "Engineer" suggests it, I will most gladly deposit £25 if he can prove that he has "thirty years' personal experience in refining bitumen for road paving," conditionally that he deposits the like amount and he proves it in your columns. With all due respect I think others than your good self should judge. He may be trading on a very scanty knowledge of the refining of bitumen for mastic asphalt, which is as old as the hills. I expect him to prove his intimacy with the manipulation of natural bitumen for road work on the lines on which he has so often written.

I will risk a further £25, for sweet charity's sake, if he can refute the following: That he really has no right to pose as an engineer, as it might lead your readers to believe that he writes as a municipal engineer. That he is interested in a concern now exploiting a patch compound for road work, (he writes on May 1st that pitch has "failed terribly"). He is now selling natural bitumen for road work which is added to pitch, &c., which must be to his knowledge (he writes on May 1st that "natural bitumen should never be mixed or laid in connection with any coal-tar product, as the latter destroys the good properties of the bitumen"). That others interested with his concern have subscribed their valuable support to his remarks in your columns, which are as inaccurate as they are insincere.

I will point out to you the closing remark in my last letter: "When 'Engineer' gives you the same right you have my permission to publish my full name, address and credentials," and will go further and give you permission to hand my name to anyone interested in this discussion who wishes to have it.—Yours, &c.,

NOT SO DUSTY.

CHICAGO ROADS EXHIBITION.

To the Editor of THE SURVEYOR.

SIR,—It will be of interest to manufacturers of road plant in this country to know that in connection with the convention of the American Road Building Association, which takes place this year in Chicago, an exhibition of machinery and material will be held.

The exhibition commences on December 14th, and is to be in the International Amphitheatre, which affords the best facilities of any building in the United States for such an exposition.

There is every reason to believe that this meeting will be the greatest gathering of those directly interested in highway construction that has ever been held anywhere.

I enclose a plan of the building, with information giving the conditions under which the exhibition will be held.

Should any of your readers be interested, I would be glad to furnish any particulars that may be desired. —Yours, &c.,

JOHN HUTCHINSON.

11 Tothill-street,
Westminster, S.W.
July 14, 1914.

Civic Exhibition at Dublin.—The opening of the Civic Exhibition in Dublin, the object of which is to educate public representatives, and the public generally, on sanitation, town planning, and the housing of the working classes, took place on Wednesday. The Countess of Aberdeen is largely responsible for the idea, which appears to have aroused a good deal of interest throughout Ireland. Representatives of fifty-seven corporations and councils in Ireland took part in a procession from the Mansion House to the exhibition.

Motorists and Signposting.—Presiding at the annual meeting of the Automobile Association, which was held in London on Wednesday, Mr. W. Joynson Hicks, M.P., referred to the work of that body in signposting the roads. He said that no doubt local authorities should do the work, but they had too much on hand, and many of them did not do the work they ought. He hoped their signposting would be brought up to the level of foreign countries. Our roads were better than those of any foreign country in the world, but not with regard to direction and sign posts.

Institution of Municipal and County Engineers.

ANNUAL MEETING AT CHELTENHAM: DISCUSSIONS IN ROADS SECTION.

At the Friday sitting of the conference [illegible] section, with the annual meeting of the Institution of Municipal and County Engineers at Cheltenham, Mr. H. T. Wakelam, M.INST.C.E., county engineer of Middlesex, presided over the Roads Section. The first paper submitted for discussion was one entitled

SOME PRACTICAL POINTS ON MODERN ROAD-WORK.

[illegible] author, Mr. [illegible] Maxwell, Assoc.M.INST.C.E., borough and water engineer, Tunbridge Wells.

Mr. J. S. Brodie (Blackpool) remarked that the [illegible] advice by the author, but he for one was not inclined to take that advice. He thought some of it was quite sound advice, but the author went too far. Of course, they all knew that the quality of tar available for this work was variable and unreliable. As engineers it was their business to see that the tar they used for tar-macadam was of the right quality. He hoped nobody would embark on making tar-macadam with a tar that was unsuitable for the purpose, or they would come to grief. In his own town, if they would hand the tar to him quite free, and cart it to his works department free of cost, he would say: "No, I do not want it; I will go elsewhere and pay for it." No tar which was unsuitable should be used at all. Then Mr. Maxwell said: "Good, fine weather is an important factor for successful work." He did not agree with that; but he thought they could lay down tar-macadam in almost all weathers, save and except a heavy thunderstorm, or when 5 in. or 6 in. of snow was lying on the ground. Those might be exceptional circumstances. Then Mr. Maxwell said: "Tar-macadam is hopeless on a weak, yielding foundation." There the author had hit the nail on the head. It was no use putting it on a weak foundation. The first thing was to put their money into their foundation, and begin, as they would a house, putting in a good foundation, and then their superstructure might be worth considering after all. Then Mr. Maxwell said: "Where there is much traffic a continual watch must be kept on the work for some time after it has been completed, which considerably adds to its cost." He did not agree with that at all. If it was properly laid he did not think it needed any watching; it took care of itself. In Blackpool they had some 300 or 400 acres of tar-macadam, and it was giving very satisfactory results. If properly mixed and made it required practically no watching. In regard to the liability to creep, there again he did not agree with the author. He thought with properly mixed tar-macadam the hot weather would have no effect on it whatever. Then the author said: "The cost of tar-macadam is, as a rule, much beyond that of a granite tar-painted surface, and its serviceable life cannot always be so accurately predicted." Neither of those propositions did he agree with. He hoped the author would not consider he was acting disrespectfully in the remarks he had made. They were offered in good faith, and with the intention to correct erroneous opinions on this subject. He offered them as such, and he hoped Mr. Maxwell would not take offence at what he had said.

Mr. E. Willis (Chiswick) said that undoubtedly Mr. Maxwell's paper gave them food for thought. He should like to differ, though he regretted to differ, as to mechanical haulage practically taking the place of horse haulage under the majority of conditions. He thought they had to go carefully—especially in respect of the smaller municipalities—in mechanical haulage. Where they had to fetch their goods a long distance, or cart their refuse over long distances, they could use mechanical haulage with advantage; but he certainly thought they could not do that in the smaller districts. With regard to the collection of information and statistics, he was thoroughly in sympathy with Mr. Maxwell in regard to that matter. Undoubtedly the most careful records should be kept as regarded every department of a municipal office. He thought they could not be too careful in keeping the records of every road in the district, with the maintenance of every road, as far as possible, analysing these results from time to time, and [illegible] they could trace not only the value of certain road material, but they could analyse as to whether there was any special reason for one road costing more than another for its traffic conditions. He should like to emphasise the importance on main roads and important thoroughfares of taking a periodical census of traffic. That should prove useful in bringing the results down to a standard unit.

Mr. W. Gregory Royston said that he made an experiment in 1904 with a road treated with ordinary tar [illegible] The surface was scarified by hand, and 3 in. of granite was put on with ordinary tar and rolled in with chippings. Although it was a very wet season when the work was done it had stood, and was as good as any piece of road which had been tar-painted; it was still standing, and showed very little wear on the surface. The [illegible] which had been done to it had been a little tar-painting in the centre where the traffic had worn it. With regard to steam haulage for road material, he had used that for country work where they had to convey it from 4 to 12 miles from a railway station. They carried double the quantity of material for the same cost, with no more damage to the road—if the drivers were careful—than they had with horse haulage. And it did not interfere with the ordinary traffic so much as horse haulage as on the hills horses were often drawn across the roads to ease them, and this interrupted the ordinary traffic.

Mr. H. Percy Boulnois (Westminster) said he thought Mr. Maxwell's paper was exceedingly valuable. Personally, he thought there was still a large field for tar-macadam. It had many advantages over other forms of road making. It could be laid in almost any weather, and with care it could be laid cheaply and made excellent roads. Wherever he went he found examples of tar-macadam quite equal if not better than modern methods.

Mr. W. H. Maxwell, in replying, said he was pleased that his paper had evoked so many adverse criticisms, and he felt very much indebted to Mr. Brodie for disagreeing with so many points, because unless there was disagreement he did not think there was much food for discussion. He could only say that Mr. Brodie's experience with tar-macadam had been a little more favourable than his own in some respects. The great trouble he had experienced had been with regard to traction engine traffic. There was no other traffic that one feared, so far as tar-macadam was concerned. When they got a 16-ton engine hauling three wagons loaded with bricks almost to breaking point, then he thought a new tar-macadam road did want watching. With regard to tar, it was a thing which did want a lot of attention. His experience was that they got a very good tar one day, and they were likely to get something else the next day unless they were very careful. It was not every corporation that would pay an expert chemist to watch these things. Although he had raised the points one to seven of difficulties in regard to tar-macadam, it was not to discourage its use. His object was to mention some of his own difficulties, and to hear other members express what their experience had been in the hope that others had been more fortunate than himself. With regard to the cost of tar-macadam, that was a very important point, but he supposed that a good deal must depend upon the locality in which it was done. If they could get the stone at an economical rate—limestone, Kent rag, or some forms of granite—they got a cheap tar-macadam; but if they were in a part of the country where it was difficult to get stone, then they had to pay some shillings per ton for carriage, and the price was altogether different. Mr. Willis had said that mechanical haulage should be limited in some of the smaller districts. His point was, what were they to do if they could not get horses and were driven to it? His experience was that he could not get horses, and there was no alternative to mechanical haulage. As to cost, one would not develop mechanical haulage on the roads, but when nothing else was to be got what were they to do?

The subject of the next paper submitted to the meeting was

GROUTING AND PENETRATING METHODS OF ROAD SURFACES, &c.

Mr. George Green, M.INST.C.E., borough engineer, Wolverhampton, was the author of the paper, which will be found on p. 80 of this issue.

Mr. E. R. CAPON (Epsom) moved a vote of thanks to the author of the paper. He had laid Rocmac which had been down for 2½ years, and it certainly did give a good foothold for horses. One trouble was that it was slightly dusty in summertime. He had been in communication with the makers as to tarring the surface, and they had advised him that tar should not be put on Rocmac. Otherwise he had found that roads made with Rocmac were the cleanest he had got.

A MEMBER: Do you say that tar should not be put on Rocmac?

Mr. CAPON: The manufacturers advise me not to tar Rocmac. I have had no experience of tarring it.

Mr. G. W. LACEY (Oswestry) said he wished to hear the opinion of members on the grouting method of construction, because he observed in Mr. Maxwell's paper he had come to the conclusion that this method was less satisfactory than tar-macadam. He also accused that type of pavement of becoming more slippery in the winter time. He had always been under the impression that they could obtain a better foothold with a grouted road surface than with tar-macadam. He was at the present time considering the putting down of a section of Plascom road, with the object of obtaining a surface which would be less slippery than would be the ordinary smooth surface of tar-macadam. With regard to Mr. Green's method of laying Rocmac and Glutrin, the Great Western Railway laid their road with Rocmac on the ordinary method of spreading the Rocmac preparation with the ordinary chippings, and rolling until the material filled the interstices of the stone. He watched that very carefully, and one felt prompted to ask whether the rolling was ever going to cease before they obtained a properly closed crust, and it struck him as a method one would not care to adopt in the centre of the town where they had traffic constantly passing over and hardly able to divert it. It struck him if the material was laid in the form of a concrete it would be a very much better system. He should like to ask whether the laying of Rocmac or Glutrin was less or more by this method than by the ordinary method, and also to what extent afterwards he rolled the crust. He took it that it must require considerable rolling, and made in that form it would bear very little rolling indeed. A Rocmac road was rather a dusty road, and last winter it was a very muddy road too. That was probably due to the heavy amount of rolling and the limestone dust put in to fill up the interstices of the road, and which the rolling did not complete. He was surprised to hear what Mr. Capon had said, because he had heard from one of the representatives of the company that it was advisable to tar the surface. If they had changed their methods perhaps those who had tarred a Rocmac road would give them the benefit of their experience.

Mr. J. EDEY (St. Neots) remarked that previous to last year there was a disinclination on the part of the proprietors of Rocmac to tar the surface, but questioning their representative, he was advised to tar it early in the season, so that before wintry or wet weather set in the tar would have worn off. He was perfectly satisfied with its wearing qualities. He preferred it in some places to tar-macadam, and he could do it at the same price—viz., 2s. 9d. per super. yard. The chief difficulty was rolling. With the concreting process less rolling was required than if laid in matrix, but even then they could reckon on 25 per cent more rolling than with ordinary material.

Mr. E. WORRALL (Stretford): What thickness?

Mr. EDEY: Three inches consolidated. He had also laid tar-macadam for ten years, and for streets in the town he preferred that to Rocmac, because on the latter there was more or less dust, and a good deal of vibration. They could notice the dust of vehicles running off tar-macadam on to Rocmac. But in exposed and outside situations he thought there was a future for Rocmac. He had also used Vianex, which was made by the Barnstaple stone and cement people. That was made the same as Rocmac, and it required less rolling.

Mr. A. J. PRICE (Lytham) remarked that he had not had any experience with Rocmac, though he had seen the little which Mr. Brodie had laid at Blackpool; but, with regard to tar-painting, he had done a fair amount of that with satisfactory results. About nine years ago he tar-painted the principal road along his sea front, and he had never had any necessity to do more than put ¼-in. chippings, with which he had covered the road ever since. In other words, he had been putting a thin coat of granite on to the road, which had practically prevented anything like ordinary repairs having to be carried out. With regard to tar-painting, they must have their tar in a satisfactory condition. All tar-macadam or tar-painting depended upon the quality of the tar. If they had not got a decent tar they could not make a decent tar-macadam with any material. If they got a proper tar they could make a satisfactory tar road with almost any material. They could bind the tar with almost any material. For himself, he had always used granite for sealing the tar upon the roads. It was harder, it did not create any dust, like limestone or softer materials, and he thought they got better value for their money, because it wore longer. With regard to Rocmac, a point in its favour was that it could be laid in winter; but it was not acting in the way it was supposed to do. It was not keeping down dust in summer, and it was muddy in winter. Surely if they had got to tar-paint a Rocmac road, they might as well do it at once, when they could do it as well and cheaply. He did not see any difficulty in laying down tar-macadam, or tar-painting a road and allowing the traffic to go on it. He had laid down a large amount of such work, and never interfered with the traffic. He had always done half a road at a time, and allowed the traffic to go on the other half. A tar-macadam road depended almost as much on the rolling as on the tar. He preferred a very fine granite for sealing the surface, because he believed if they prevented a road breaking up and disintegrating they must have the surface sealed with a fine coat. If the water got into it the road would soon break up.

Mr. P. JOHNS (Maidenhead) hoped the discussion would not close without eliciting some information which would enable them to answer one of the queries raised by Mr. Green—some class of road making compatible with modern methods which it was possible to carry out during the winter months. He, unfortunately, was not able to give any information as to any such method. But he did want to emphasise a point raised by Mr. Green. In a small borough like Maidenhead he found that any horse-hire for road making was required at the same time as the horse-hire for watering. He had twelve horses owned by the corporation. They used under the old methods of water-bound roads to be used economically throughout the whole year in watering and scavenging during the summer months, and for road making in the winter months. Those days had passed away for the majority of their roads, and he had found a great dearth of horses for hire during the summer months. His demands on a fine day for watering, as well as tar-painting, often amounted to thirty horses. They had to be ordered over night, and if rain came on he had great difficulty in finding them profitable employment. If the paper elicited any methods of road making which could be carried out in winter it would be of real benefit. He should like the experience of any of them who had carried out tar-macadam or tar-grouting during the winter months. In the tar-grouting he was carrying out in Maidenhead he used the Ellis James spraying machine. They had been successful in passing Tarvia through the sprayer. It was absolutely essential that the road should receive the sealing coat when dry, and everything depended upon the sealing coat. The success of that method of road making at a cost of about 1s. 9d. or 1s. 10d. per yard, made complete, had been really wonderful, and if any of them had not tried it—he was not advertising Tarvia—they would be surprised at the excellent results which could be obtained, but that could only be done in the finest weather—and there was his real difficulty.

Mr. S. S. HAYWOOD (Brighouse) questioned the suggestion that tarring on a Rocmac road had not been successful. He had had a Rocmac road for five years, and there was the difficulty of dust in summer and mud in winter. Rather against the advice of the makers, he took his courage in his own hands and tarred the road, and in his experience there had been no damage to it. The only difficulty he had

these roads there was not sufficient care taken in the selection of the stone as with a water-bound road, and that must have an effect on the life of the road. Perhaps the author would give some information with ordinary macadam water-bound roads. Then as to pitching and surfacing, Was there any difficulty in getting well pitched? There were places in all roads where the traffic, being concentrated, must wear more than the portion which did not get so concentrated. The question had already been raised with regard to the tar-spraying of these special road surfaces. He was inclined to agree with some of the previous speakers who had pointed out that if they were going to put in special surfaces, and then had to tar them, they were not getting very far forward in road surfacing. It seemed to him they wanted something that would meet all conditions; otherwise they might as well use the old water-bound macadam. Was it possible to get a tar road surface during the winter? His answer was Yes. He would give them a case. One was three winters ago [illegible] towards the end of November. The system he used was the sealing system, putting down a coarse, medium, and fine or sealing coat. The weather was extremely good up to the middle of December, and after then it could not have been worse—it rained every day. The road was carried forward on the three layers: and when they got into this wet weather he was faced with the difficulty of a waterlogged tar-macadam. The length of road that was being laid was unfortunately dead level. He left the sealing coat off until after the Christmas holidays. Fortunately they then got two or three days dry, sufficient to allow him to get on the sealing coat, though he would not say that the tar-macadam was absolutely dry. That road had been laid more than two years, and if they went over it to-day they could not tell which was laid in the bad weather. Last year he was up against a worse proposition, as he had snow come down on tar-macadam, and had to suspend the work until the snow thawed out of the road surface. As soon as the snow had thawed he adopted the same principle as before, and kept on sweeping the water from the snow. Mr. Hadfield, of Sheffield, had just the same experience, and he had his roads so wanted as in summer, and there was no detriment to the road.

Mr. T. Frank (Newark) said some of the speakers had asked for particulars as to a Rocmac road. He laid two lengths of that type of road four years ago, and at that time no Rocmac roads had been tar-painted. Rocmac was particularly useful for roads on a gradient, as the rough surface gave a hold for the horses' feet. Mr. Gullan said they lost the advantage of the proprietary articles if they tar-painted them. But if they could get a road material which could be held together by a rough surface so that the horses could get a hold for their feet on it, it was a great advantage. He found that Rocmac gave that foothold. And the following summer the road, laid on a gradient, was tar-painted. He found the Rocmac in wet weather to be the cleanest road. Rocmac, even if it had no tar upon it, was less dusty than an ordinary water-bound macadam road. They could take the cost of a Rocmac road as being 6d. per square yard over and above an ordinary water-bound macadam road, using the same aggregate. Some had mentioned tar-macadam being carried out in the winter months. He was situate in a district where a good deal of Tarmac was being used. They were making that material so good they could not get it for love or money, and in his district the main roads had to be carried out in the winter months. There was no difficulty or danger in carrying it out if they got the sealing coat put on in dry weather. He had used granite chippings with Tarmac in order to get a different wearing material. The Tarmac was [illegible] granite chippings on that they got two materials wearing at different rates, and they got a rather better footway for vehicular traffic.

Mr. A. G. Bradshaw (Lancaster) said he wished to tell them of an instance of some slag tar-macadam he laid in wet weather. The first piece he laid was on the bridge on the main west road, which carried the whole of the through traffic Skirton Bridge. There was on the bridge a tramway track and an ordinary water-bound piece of road. It became [illegible] to excavate all the water-bound macadam and lay down a wearing surface. So when they had excavated it, and rain came on, there was no means of escape for the water. A heavy thunderstorm came on, and this shallow place filled with water. There being so much traffic on the bridge, it was allowed to sink away, but it left the surface muddy. This tar-macadam was laid, and, despite the condition, it did not seem to have any ill-effect. It had now been there eighteen months, and was in good condition, where the traffic was so great that the ordinary water-bound macadam had to be renewed three times a year. The tar-macadam was a slag macadam, made in Wigan by the Wigan Coal and Iron Company. It was all mixed by hand, and laid on hot plates on which the tar-macadam was allowed to remain all night, so that all surface tar was allowed to cook itself off the stone during the night. He had laid a length of Rocmac, which was laid 5 in. deep, and the cost worked out at 4s. 3d. per yard.

Mr. Price: What is the cost of the tar-macadam?

Mr. Bradshaw: About 3s. 3d. He did not believe in putting a 3-in. coat down; he preferred to put 4 in. It was worth the initial cost. If they laid 3 in., and it was consolidated, if it became consolidated there was very little of the original coat left. If they started with a 4-in. coat they had a little more latitude. As to tar-spraying, he entirely disagreed with those speakers who said that tar-spraying would last through the winter. On the main road of Lancaster they had tried putting it on thin and thick; they had got to get it off again in the winter, especially in the municipal area. Public opinion compelled them to take it off. In the discussion on Mr. Maxwell's paper Mr. Willis had expressed the opinion that surveyors ought to keep very accurate statistics of all the work they had in hand. They had all paid visits to the Local Government Board offices in their career. They had their tale all very nicely thought out, and then they found that the Local Government Board officials knew more about their own town than they did themselves. His experience was that they would not have time to get those statistics pigeonholed. They would never find the efficiency they had in the Post Office and other branches of the Civil Service with the staffs they had in their offices. He should also like to refer to wood paving. They had been laying wood paving for twenty years. They absolutely found that wood pavement was the pavement. They got eighteen years' life out of wood pavement.

The Chairman (Mr. H. T. Wakelam): What kind of wood?

Mr. Bradshaw: Softwood, creosoted deals. They had at times used beech blocks, but they had been a failure, and had not the life that creosoted deal blocks had. There was no doubt that in London they had solved the traffic problem. (A Voice: No!) He meant as carrying the weight they had solved it by wood. He believed they would live to see the day when our highways were kept in the same state of perfection as those of London to-day.

Mr. C. F. Gettings (Worcestershire) asked whether before applying the material the author had found it necessary to put in a foundation. His experience was that where they had an existing tar-macadam road it generally was in the best condition before they applied any concrete construction, and that where they tried to put on a layer which was generally said to be 3 in., but was usually 4 in., they were subject to getting an uneven road. He should like to ask Mr. Green whether he had dried the whole of his stone or whether he had surface-dried it; also what filler he had found best for his mixture, and also what method of distribution he had found best; whether he had found any difficulty in getting an even distribution, and getting the whole of the voids absolutely filled in. His experience was that they were absolutely in the hands of the men, and that in some cases they got their material filled in solid

and in other very traffic-ky. He did not know whether Mr. Green had put out sections of pitch-impregnated work. He had seen a number of cases where it had been decayed himself, where he had thought the work all right to last, and it had merely stood on the top. In pitch-grouting or tar-grouting, either forms of construction, there is the crushing with stones, and under great difficulties in having to use the traffic forward while the work was going on. Previously Mr. Green had been in the position to close up a street while the work was in progress. As to Rochdale, it was certainly said that it could be used in any weather. He was afraid he could not agree with that. He had a case only last [illegible] one of the worst districts in his county, where Rochdale was in part. It was commenced in October, and the work went on very well so long as the weather was good, but immediately they got indifferent weather they found that the material had not set to a sufficient extent to put traffic on it. In that case they had very heavy traffic going over the road from a quarry. There were four or five light tractors going over it daily. It was necessary to construct half the road at a time. Under those conditions it was quite impossible to put Rochdale or anything of that nature to stand [illegible] months. They abandoned the work for the time being, and it was again commenced some few weeks ago. They found that the Rocmac set, and they could put the traffic on in about four days. He was disagreeing with some of the speakers that it was not policy to put tar upon a Rocmac surface. He had found it advantageous in several cases. In fact, if it had not been tar-painted in two cases the road would have been disintegrated. He had been interested in the remarks of Mr. Gullan about putting tar-macadam down in any weather. He was afraid he was in the minority, but he could not altogether agree with what some of the speakers had stated. He was looking at it from the point of view of putting it down, and where they could not divert the traffic. In boroughs where they could divert the traffic, it was different altogether. He had not the advantage of knowing whether Mr. Gullan had been in the position to stop his traffic, or whether he had applied the material hot or cold. It seemed to him, in many cases, where they had tried to keep the traffic going, they had been forced to put it down in the winter, but this last winter he stopped it. He found where they tried to carry on the traffic they got a certain amount of foreign matter carried on to their 1½-in. coat, and he could not agree that it was the best method to let that foreign matter get in the road before they put the sealing coat on. If they got that foreign matter in their 1½-in. coat, he could not conceive how they could get the best life out of their material.

Mr. H. F. GULLAN (Belfast) said the material that was laid was cold tar-macadam that had been made not less than three weeks, much of it considerably more than that period. The material was never sent out fresh. The stuff was allowed to remain in the depot not less than three weeks to mature. The secret as to whether the work could be satisfactorily done in the winter time lay in the material. If they had an inferior mixture, or the stone was not dried when applied, he could understand failure. The traffic was kept going while the work was in progress. It was an 18-ft. road. The road was split in the middle; one half of the road was laid for a distance of 100 yds. or 200 yds., and when the work was completed about 7 ft. 6 in. was opened, and the traffic allowed to take that portion only. The other portion of the road was then laid.

Mr. PRICE asked whether all the stone came out of store.

Mr. GULLAN: Yes. If they put the material on without the tar being properly matured, the ammonia came out on the surface.

Alderman BAINBRIDGE (Stockton) asked whether it was the experience of most of the engineers present when they ordered a 10-ton roller it generally weighed from 13 to 14 tons when they received it. They had ordered one specially to be 10 tons and it weighed 13 tons 12 cwt. They had in their district abnormally heavy traffic, and from Manchester and Sheffield vehicles weighing 40 tons, drawn by two traction engines, had been coming over their roads, which had been laid down with a good tar-macadam surface. Was it their experience that tar-macadam was a suitable road for 40 tons with two heavy engines attached, or would it be more advantageous to put in a concrete foundation, 2 in. or 3 in. of sand, and 4-in. whinstone cubes.

Mr. MEASHAM LEE (Karachi) added his personal thanks to Mr. Green for having put this paper before them, and particularly as it had enabled him to listen to an extremely interesting discussion on the question of treating road surfaces. He certainly should not attempt to criticise any of those methods that had been advocated by various speakers. He could look upon them as giving him information which could be useful to him in [illegible], and being five years out of England it was certainly an additional interest to listen to the discussion. Some of the speakers had referred to their own districts in their own towns. He might say, with regard to his district, they were not troubled with the difficulty of drying their stone, and considering that they only got rain on about ten days in the year, they were not very much troubled whether they should lay tar-macadam in wet weather. He could say they were troubled with dust, particularly as he was in a district mainly composed of [illegible], and they were there with the same traffic as in this country. They had the fast-moving traffic with a large increase in motor vehicles, and they had to make their road surfaces to meet the new conditions. He found that the ordinary commercial tar was not suitable for treating the roads. So far as the grouting of tar-macadam was concerned, he had done some little work in that way, especially as the cost of the tar material which he had to put into the road did not seem to be justified. It was far more satisfactory to put in tar-macadam altogether or do tar-painting. He wished he could get the same results as Mr. Price, who said he had a tar road which had stood seven years. (Mr. Price: Nine years.) He had difficulty in getting his to last seven months. He had come to the conclusion that Rocmac was not the material he wanted in India.

Mr. J. YOUNG (Ayr) said he had laid three or four streets with Rocmac on the Gladwell system, and the concrete method, and he preferred very much the concrete method. If they could get a good, rough surface, and could prevent clogging of the lime chippings on the surface, and get that thoroughly brushed on and tar properly spread, they would get a thoroughly satisfactory road; but they must not attempt to tar-spray a smooth surface of Rocmac; that was his experience. With regard to water-bound macadam, he heard Mr. Boulnois say that the days of water-bound macadam were over. He did not think so. He thought there was some splendid water-bound macadam to be made, and that they would still hold on it, and tar-spray it. He hoped they would when they were kept down to minimum cost, and had to produce satisfactory surfaces for motor traffic. They would find in counties that roads which were tar-sprayed made excellent roads. In Scotland they were somewhat in an experimental stage; they had been hanging on to the skirts of England as regarded tar-macadam. A committee of the Scottish District of the institution had approached and were successful in getting the Road Board to contribute 75 per cent of the cost of eight or nine experimental strips of road in Scotland. Those were being put down this summer, and by the next annual meeting some very educative results would be forthcoming. He was sorry Mr. Walker Smith was not there, or he could have given them details, and how he got the money out of the Road Board.

Mr. J. S. BRODIE (Blackpool): Are the experimental strips all in one district.

Mr. YOUNG: No; all over Scotland. They had selected districts of different rainfalls and climatic conditions, and they required to have these standardised before they could make proper comparisons. As to tar-grouting, he thought that was a satisfactory method of renovating an ordinary macadam road. Laying down 1 in. or 1½ in. of whinstone metalling, roll that dry, put a little chippings on it to fill up the interstices, roll it again, tar it, put on more chippings, and roll it again. He had to lay down a road last autumn on that method, and it had preserved a beautiful skin all the winter. Another he laid 3 in. thick in front of the entrance of an ice factory, where there were a number of motor vehicles going, and it stood exceedingly well. The skin was hardly broken.

Mr. MATTHEW JONES (Chester) said the little experience he had in the tar-spraying of roads might help some in doubt. He tar-sprayed on the average about 80,000 yds. of water-bound surface each year. The average cost ran out at about a penny per square yard. That included the thorough brushing of the dust off the roads, tar-spraying and spreading with granite chippings. He had to pay 7s. 8d. per ton for

granite chippings. One street in Chester, Northgate-street, cost 1s. 6d. or 2s. per yard for resurfacing. He might say that for the past five years Northgate-street had not cost more than a penny per yard for tar-spraying, and was in very good condition. The chippings he put on seemed to fill up and would last for twelve months without getting down to the ordinary macadam. He was a great believer in tar-spraying if it was done in the proper way and the dust brushed off the road. They could put down tar-macadam or Rocmac, and he did not think any makers would guarantee them more than five or six years' life, and then they had got to re-start pitching. A water-bound road tar-sprayed cost 1d. per yard instead of 8d. or 9d. If he were to put down tar-macadam it would cost him 2s. 9d. or 3s. per yard, and in three years he should have to start tar-spraying it.

Mr. A. J. WEBB (Hendon) thanked Mr. Green for the opportunity of discussing this paper, which was of interest to all concerned in road making. Mr. Jones claimed to tar-spray his roads for 1d. per yard super. In Middlesex they could not do it under 2½d. per yard. He did not know what he paid for labour and for carting. Mr. Jones said his material cost 7s. 8d. per ton; he could not understand it. Another point was the water-bound roads. They got on secondary roads very excellent results from water-bound macadam roads when they had been tar-painted the second year; but where they had a constant stream of motor 'bus traffic they could not maintain a good service on the road; it was in waves. He had seen 200 tons of granite put on one-third of a mile of road, and in three months the road was in bad condition. He did not know how they could maintain a good surface on a tarred macadam road with heavy motor traffic. In his experience such roads were not suitable, and would be a failure with the heavy motor 'bus traffic they had at the present time.

Mr. JONES: I took the precaution to say that Chester was a residential city, not a district like Hendon.

Mr. G. W. LACEY (Oswestry) said that a week ago they had a torrential downpour of 2·62 in. of rain falling in the space of an hour. The effect of this was that certain watercourses burst their culverts and rushed down at tremendous velocity through the lower part of the town. Some of those roads were not tar-sprayed. In every case where the road had not been tar-sprayed the volume of water covered the surface, and almost every particle of binding material was washed out of the road: but where the road had been tar-sprayed not the slightest damage was done to the surface. If tar-spraying would stand abrasive action in that way, everyone would see that it must be of great value in withstanding traffic. It would not stand motor 'bus traffic, but his experience had shown him its value as a binder on a water-bound road.

Mr. GREEN, in reply, said Mr. Capon asked as to the tarring of Rocmac. He had the same advice from the makers: "Do not tar-spray it." But he found after allowing it to have one winter over it, with the frost and the rain, the weather had had its worst effect on the lime, and it could be safely done. With regard to tarring, it was quite safe after the first winter or the first six months. Mr. Lacey asked if Rocmac afforded a better foothold for horses. He thought that was one of its strong points. He had laid it on a gradient of 1 in 19. It had a tramway in the centre, and he put Rocmac on because he could not put a smooth, tarred surface. Tarring must make it a little more smooth, but there was a roughness about Rocmac which remained through an ordinary coat of tar-paint. It did take less rolling when made in the concrete form. It was a very considerable saving in labour and in rolling, and therefore cost less. Mr. Edey did not recommend the tarring of Rocmac. He thought they all had their differences. They all had their own opinions. He did not think they could apply any general rule. What might apply in Wolverhampton might not apply in a county, or in every town. The traffic of one town was more muddy and greasy than another town, and they had to make allowance for that kind of thing. Mr. Price had mentioned that he tar-painted his sea front road every year. That applied to himself. He had also miles of Tarmac. He thought it was wise if they had any heavy traffic to tar-paint and coat with chippings every year. It was a very economical custom. The difficulty Mr. Johns had experienced in getting tarred materials was very similar to his own. He had no sooner commenced to make a tar-macadam road than he had to ring up the makers and ask why the material was not coming. The invariable answer was that they had had a breakdown in the machinery. At first he innocently thought they were speaking the truth, but he found all surveyors had the same explanation given to them. It must be very bad machinery was all he could say. He could lay Tarmac for 2s. 6d. or 2s. 9d. per yard.

Mr. J. S. BRODIE: What thickness?

Mr. GREEN: Four inches rolled down to three. He lived within carting distance of the Tarmac works, which was a very great advantage. Mr. Gullan asked the price for the Rocmac. He found he could lay Rocmac or Glutrin with Clee Hill or other similar stone for 3s. 9d. per yard. He was rather near to it.

Mr. MEASHAM LEE (Karachi): What does Clee Hill stone cost?

Mr. GREEN: Nine shillings a ton.

Mr. JOHNS: My granite costs 13s.

Mr. GREEN: With regard to the comparison of life, he should think the life was about three times that of water-bound macadam. They laid all these special things under special traffic, and the prices and the life were not comparable. Then he was asked if he had any difficulty as to pitching. He found that very small indeed. With regard to tar-spraying, it was rather suggested that if they had to tar-spray Rocmac they made it much more expensive. He, personally, tar-sprayed his macadam roads in every case to add life to them, and so that they should continue to give the best results. He understood that Mr. Gullan could lay Tarmac in winter as well as in summer, but, personally, he preferred to do it in dry weather. Mr. Franks, of Newark, seemed to agree with his remarks as to tar-painting upon Rocmac. He knew the roads were very good in Newark, because he was there recently; but he was afraid they had not the amount of traffic they ran against in the larger provincial towns. Mr. Bradshaw did not seem to think that tar-spraying would last through the winter. He thought that depended on the character of the road which was tar-sprayed. He had some roads which had been tar-sprayed for years with never any suggestion of lifting; but he had others which always came up in winter. He had hesitated to tar-spray any road which would not stand the winter through with it on. Mr. Gettings asked about putting in a foundation for tar-macadam roads. He thought that was absolutely necessary. He thought it was a waste of money to lay Tarmac on a road unless it had a good foundation and was drained. Where he tar-grouted in the ordinary way he did not dry the stone. He trusted to doing it in fine weather. He did it with the ordinary refined tar in fine weather. He had no means of drying the stone, and it would be very costly if one had to do that. Rocmac did take longer to set than tar-macadam; but all these roads would be better if allowed to rest a few days before traffic was put on. He always tried to do roads in Tarmac one-half at a time, so that the traffic did not go on it until it had set. Mr. Bainbridge said that 10-ton rollers always weighed more than 10 tons. He had found that a 7-ton roller was an exceedingly useful thing for Tarmac and things of that kind. He had given up a 10-ton roller, and had a 15-ton and a 7-ton. As to Mr Measham Lee, he had no doubt that there were many gentlemen present who would be glad to go over to India and give him expert advice as to laying dust at the proper fee.

Mr. MEASHAM LEE: Would you guarantee success?

Mr. GREEN said, with regard to Mr. Jones, of Chester, he could not do tar-spraying so cheaply. It cost him about 2d. per yard. He cross-questioned his foreman as to why it was costing more, and when he explained that he was putting on more material he complimented him, and he found that the more they used in reason the better it was and the cheaper in the long run.

CHAIRMAN'S REVIEW OF DISCUSSIONS.

The CHAIRMAN (Mr. H. T. Wakelam) said he would like to add a few remarks in connection with what had been said with regard to the different papers. He should like to congratulate the authors and the members on the very interesting and able papers they had had before them for discussion in the Roads Section of the conference. The papers were prepared for criticism, and he was quite sure that the writers would take the adverse criticisms in the spirit in which they had been made by the contributors to the

discussion. He certainly thought that some good should come from the discussions which they had had in connection with the subjects treated by the papers. Mr. Boulnois had said that the traffic on the roads was found to undergo a great change. He thought everyone who had had anything to do with roads during the last two or three years would confirm Mr. Boulnois' statement. There was no doubt that the traffic on the roads was changing in an extraordinary manner in its character. If they stood near to Westminster Abbey for five or ten minutes and noticed the character of the vehicles which passed that spot, and compared them with the vehicles which passed there four or five years ago, no one would dispute the accuracy of Mr. Boulnois' words. Mr. Boulnois also said that proper provision must be made for the new kind of traffic. No one would question that statement. They had to try and obtain materials and systems of management which would meet the constant increase of traffic in all directions, and also the varying character of the vehicles they now saw on the roads compared with what they had to contend with heretofore. Mr. Gullan, in speaking on Mr. Boulnois' paper, raised a very pertinent point as to a practical knowledge of the subject as against a theoretical knowledge. Personally, he was one of those who thought that practice was of a great deal more value than theory in road construction. Common sense was one of the greatest attributes that an engineer could possess in regard to road construction. The theorist sticks to a particular line; at least, that was his experience of the inveterate theorist. He could not look so far ahead as the man with practical ideas could, and as was mentioned by one of the speakers, it was absolutely ridiculous to draw a cast-iron line between theory and practice on the subject of road making. Combine them if they would, but he was a believer in the old saying, "Give me an ounce of practice before a ton of theory." Mr. Sinnott's paper and his remarks were of a very interesting character. Mr. Sinnott was a man of very broad views and experience in engineering works. He looked upon Mr. Sinnott, although he had not been in the ranks of county engineers for more than three or four years, as a great acquisition, because he believed that previously Mr. Sinnott had a large experience in docks and railway work, and he brought to the subject of road maintenance originality of thought. There was no doubt that lateral movement was one of the greatest drawbacks to the maintenance of good roads. They had to meet it, and he was sorry to say that cases arose where they could not meet it at the right moment. In Middlesex he had a case in which it was his duty to put in a kind of carriageway—it was previously an ordinary water-bound macadam road—and unfortunately before they could put in the kerbs the motor-bus services, within six months, cut the road all to pieces, and before they had time to put in supports for lateral movement they had to resurface the road, and put in a temporary support for transverse movement. Now they were laying a 12-in. by 6-in. kerb on a wall of concrete to withstand the outer pressure on that road from the traffic going over it. He happened to see the box which Mr. Sinnott had referred to lying by the side of the road, and although Mr. Sinnott had had a good deal of practice it seemed to him it was like getting a steam hammer to kill a gnat. It seemed to him that the prevention of lateral movement could be carried out at much less cost than by boxes of that kind. As to cutting into roads for laying down and repairing gas and water and other pipes, he was glad to say the Middlesex County Council had a Bill before Parliament—it had passed the House of Commons, and was now going before the House of Lords—in connection with the new arterial road they had to construct, and in that Bill they had a clause to take powers to prevent anybody from interfering with the carriageway at all after it was completed. No movement in connection with the road surface other than resurfacing would ever be allowed on that road. The Parliamentary agents were asked to draft a clause which absolutely prevented any interference by any outside authorities. All sewers, water mains, gas mains, electrical cables, and everything for the use of the residents living on that road would be laid in the footpaths. They were giving them a width of 15 ft. in the footpaths for their work. Everything in the way of gas and water mains and other services would be duplicated on each side of the road. He hoped the Lords would see eye to eye with the Commons on such an important matter. Referring once more to the question of movement, the point as to moisture in the subsoil was put forward as one of the difficulties they had to contend with. He felt inclined to agree. He had a provincial county under his control for some years. He saw Mr. Parker, of Hereford, present, and he had to meet the same trouble as they had in the county, and he would agree with him that moisture and clay were the chief factors they had to meet in transverse movement. They had got it to deal with in towns; but they had more money at their disposal, and could take better and quicker means to prevent it. Also another point was raised by Mr. Thomas as to the laying of large pitchers alongside country roads to prevent this lateral movement. They had all seen Telford's method of road construction. They had seen the large blocks laid in the centre, diminishing in size at the sides of the road. He did not know whether modern practice was going to reverse that. With regard to Mr. Hawkins' paper, he would like to say that county surveyors were not, as somebody said, wishful to boss the show. County surveyors were serving the public and the ratepayers just as the urban and city men were, and they had only one interest to serve, and that was the purse of the ratepayer, and they looked after that as well as they could. They had a very interesting paper from Mr. Wood, of Fulham. On the question of wood paving he could not quite follow his remarks about a cost of 6d. per yard being the denominator to follow as to the introduction of wood paving. Mr. Wood said that any road costing 6d. per yard in macadam was a road upon which they could lay wood paving with advantage. Probably Mr. Wood did not include payments of interest and repayment of principal of loans; he supposed he must have been referring simply to maintenance. No man could lay wood paving and pay off the debt for 6d. per yard. It worked out in Middlesex—and in the last ten years they had laid 100 or 200 acres of wood paving—at a cost of 1s. 7d. per yard per annum, plus 2½d. or 3d. per yard for maintenance. Another remark was as to bituminous roads costing 4s. 6d. per yard and lasting ten years. He only wished he could get such roads in Middlesex. He should like to get a bituminous road to last five years for 4s. 6d., or even 5s. He was glad to hear Mr. Hadfield and Mr. Gullan both promise to let them have further information of the work they were doing in connection with bituminous roads. Mr. Harpur, of Cardiff, made a rather apt remark when he said he would like to have a line of demarcation fixed between bituminous and water-bound roads. With regard to the tar-painting and spraying of macadam roads, he thought the meeting was labouring under a wrong impression as to the cost of such work to Mr. Matthew Jones, of Chester, and Mr. Webb, who said his tar-painting was costing 2½d. He thought the difference in cost arose in this way—in one case the work was done by a mechanical spreader, and in the other by hand labour. In Middlesex Mr. Webb's work was done by hand labour. As to tar-spraying, he remembered that in 1906 he brought up a paper to the institution on tar-spraying and painting, and at that time the question was looked upon askance by members of the institution. He was glad to see those gentlemen had lived long enough to see there was some advantage in tar-spraying, and that some good had come from the practice of tar-painting of the roads in all directions in the kingdom.

This concluded the business of the Roads Section.

(To be continued.)

Automatic Street Lighting System for Troon.—A report of the burgh surveyor on the street lighting was considered at a recent special meeting of Troon Town Council, and it was agreed that automatic lighting should be adopted. Subsequently four tenders for a complete installation of automatic street lighting were opened, and it was agreed that that of Messrs. Alder & Mackay, Edinburgh, amounting to £662 10s., should be accepted.

Coast Sand Dunes, Sand Spits and Sand Wastes. By Gerald O. Case. 5s. nett. London: St. Bride's Press, 24 Bride-lane, E.C.—This work is a treatise on the advantages of the proper utilisation of inblown sand, so as to turn it into a protection against coast erosion, instead of being, as too often at present, an active agent in such erosion and in the laying waste of fertile land. The author draws many of his examples from Scotland. He points out the work that has been done on the Continent in turning sand wastes into pine forests. The book gives an able and systematic treatment of its subject.—*Scotsman.*

Law Notes.

Edited by J. B. REIGNIER CONDER, 11, Old Jewry Chambers, E.C., Solicitor of the Supreme Court

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries should be sent to arrive not later than first post on Tuesday, and, as one side only should be addressed to "The Law Editor," at the office of THE SURVEYOR, accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be quoted. All explanatory diagrams must be drawn and lettered in black ink only, and in such style as to be fit for direct reproduction, i.e., without re-drawing or amendment. Unless these conditions are complied with we cannot undertake to reply to queries.

WATER SUPPLY: FREE SUPPLY: COVENANT.—A writer, who has been [illegible] Director, Mr. Justice Neville held that the obligation to supply water free to the house was discharged, the building having been so altered and enlarged that it had ceased to be the [illegible] existed at the date of the covenant. As regard to the farm buildings, however, he held that they remained substantially unaltered, and that the obligation to supply them was still subsisting, but that the water so supplied must not be used for the purposes of [illegible].

QUERIES AND REPLIES.

In order to avoid confusion queriists are requested to use distinctive words as noms de plume. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

BREACH OF BY-LAWS.—"YPRES" writes: A wooden bicycle shed has been erected in the wharf opposite offices in this town without those carrying out the work first giving notice of their intention to do so, and without submitting plans thereof to my council, as required by Article 92 of the Building By-laws (Model series) in force in the district. The building in its present position is not exempt from the operation of the by-laws, as it is within 5 ft. of the highway and within 30 ft. from the nearest building, and from the boundary of adjoining lands or premises—*vide* Article 2 (*c*). The owners have subsequently slated the roof and sides of the building, but it still contravenes by-laws 11 and 20, which require the walls to be built of incombustible substance. The owners have been asked (*a*) for any explanation they have to offer for their failure to comply with the requirements of the by-laws, and (*b*) to pull down the building, which notice was signed by me and not by the clerk, as provided by Article 99. But before asking my council for instructions to serve a statutory notice upon the company requiring them to show cause why the building should not be pulled down, or that a summons so as to enforce compliance with the terms thereof be issued, I shall be extremely obliged for your advice on the following: (1) Whether the proper procedure is to prosecute the owners for contravention of the by-laws in neglecting to deposit plans, &c., under the provision of By-law 92; or (2) to proceed under the provision of By-law 99, whereby it would be necessary to give the owners notice to show reason why the building shall not be pulled down, &c., which notice, it appears, must be signed by the clerk; (3) whether forms of notices applicable to the case in question can be obtained from the Government printers or elsewhere; (4) and whether, inasmuch as the slate company's offices and wharf (whereon the shed has been built) are on land in their occupation, which, together with the harbour and several other wharves, were constructed under a private Act of Parliament obtained by the predecessor of the present owner of the estate, the building would be exempt under Clause (*d*) of exempted building included in the by-laws which enacts as follows: "Any building (not being a dwelling-house) belonging to any person or body or person authorised by virtue of any Act of Parliament to navigate on or use any river, canal, dock, harbour or basin, or to demand any tolls or dues in respect of the navigation of such river or canal, or the use of such dock, harbour or basin, and used or intended to be used exclusively under the provisions of such Act of Parliament for the purposes of such river, canal, dock, harbour or basin"?

The offices and wharf are leased to the company by the estate, who obtained the Act of Parliament referred to, and who are the harbour authorities; but the building in question does not belong to the harbour authorities, neither are the owners of the building empowered to demand any tolls or dues in respect of the navigation of the river, &c.

1 and 2. In my opinion the more effectual remedy is to proceed under By-law 99. The notice should be signed by the clerk. 3. I cannot say. Inquiry should be made at the printers. 4. In order to bring the building within the exemption it must not belong to the harbour authorities, and (5) be used exclusively under the Act for the purposes of the river, &c. Unless therefore it is used exclusively for the purposes of the river, &c., it is not exempt. But if it is used exclusively for those purposes, and belongs to the harbour authorities, it is exempt. If the harbour authorities are the freeholders, and if the building is attached to the freehold, it may belong to them within the meaning of the by-law, although the site is leased to the company.

HIGHWAY: WELL COVER.—"CORNWALL" writes: There is a public house here which has its front built right up to the edge of the road, and is supplied with water pumped from a well sunk underneath the carriageway. The well has a diameter of 6 ft., and the centre of this is 7 ft. from the front of the house, and out in the carriageway. The covering is granite cover-stones, let down flush with the road surface. There is a lot of traction traffic on this road, and just at this point the road is very narrow, and the traffic crosses the cover-stones and is damaging them; in fact the spot is looking dangerous, owing to the well showing signs of caving in. Will you kindly advise me what action to take in this matter, as I, being the district surveyor, am responsible for the road?

If the highway was dedicated, subject to the existence of the well, I do not think the owner of the public house would be liable to repair the coverstones. See *Robbins* v. *Jones* (9 L.T. 626), *Hamilton* v. *St. Germans, Hanover-square* (29 L.T., 428). Sec. 83 of the Towns Improvement Clauses Act, 1847, provides for the repair of dangerous places *near* a street at the expense of the owner; and sec. 30 of the Public Health Acts Amendment Act, 1907, provides for the repair, protection, or inclosure at the owner's expense of dangerous structures, wells, &c., in any situation fronting, adjoining, or abutting on a street. The former enactment applies to urban districts, and may be put in force in rural districts by order of the Local Government Board. The latter enactment applies to districts in which it has been put in force by an order of the same board. But neither of these sections appears to apply to the case of a dangerous place actually *on* the highway. Assuming that this highway is repairable by the inhabitants at large, and that it was dedicated subject to the existence of the well, I think the coverstones should be repaired by the highway authority.

DAMAGE TO LAMP-POST.—"ALEX" writes: A motor car, while turning a sharp corner, recently, had its steering gear broken, with the result that the driver lost control, knocked down and completely broke a lamp-post. Could I recover for the damage done to the lamp-post? The lamp and the gas under which it is supplied to the council by a private company, but the council are the owners of the lamp-posts and fittings.

If the accident was due to negligence the council could, I think, recover the damage.

We have to draw the attention of queriists to the directions laid down for their guidance in regard to the preparation of diagrams. Rough sketches obviously cannot be made use of, and we should be obliged if correspondents would therefore send only carefully-prepared drawings, preferably about 6 in. in width, and without colouring or wash of any description. Failure to observe these rules will involve the risk of queries remaining unanswered.

Some Practical Points on Modern Road Work.*

By W. H. MAXWELL, ASSOC.M.INST.C.E., Borough and Water Engineer, Tunbridge Wells.

In the planning of new routes, directness of line is usually an important feature to be considered, from an engineering and utilitarian point of view, but leads to monotony in the use of the road, and does not assist enough in comparing unfavourably with the characteristic winding roads of rural England.

As a general rule, it will be more advantageous to carry a new through route past the outskirts of a town, and connect up with some good branch road to the urban area, rather than attempt to carry the new main thoroughfare through the heart of a populated district, as the difficulties and costs of widening existing narrow roads through built-up areas are necessarily excessive, owing to the property and business interests disturbed. Very wide roads are not favoured by shopkeepers, as they are not conducive to good trade, the bulk of pedestrian traffic usually keeping to one side of such a road.

Curves on a new main road should, of course, be as easy as circumstances will permit, but a radius of 100 ft. should be the minimum where fast through traffic is to be accommodated. On this curve, a person travelling along the centre line of a clear 9ft roadway could see approaching traffic within the limits of the road-width about 120 ft. ahead. Under similar conditions, with a 150-ft. curve, a distance of about 150 ft. ahead could be seen. On rural roads, traffic invariably uses the centre of the road in preference, and motorists high speeds require an ample, unobstructed view essential.

The easing of curves invariably quickens the speed and reduces that degree of commendable caution in drivers which formerly existed. On a sharp curve the motorist is bound materially to reduce his speed or perish.

Curves should in all cases be freed from side-sight-blocking obstructions, and for increased safety to cars using the road, a slope on the outside curve should be given a suitable degree of super-elevation.

On a part of the Holyhead road on the north side of the city of Coventry, Telford adopted a ruling or maximum longitudinal gradient of 1 in 35. Such a modern gradient will present no impediment to fast driving, either uphill or down, and is one on which tar-macadam and all modern methods of surfacing may be used with safety, but in hilly country will be difficult to maintain, except by much contouring and consequent increased length of route, or by heavy cutting and bridge work.

Dead-level roads are to be avoided. If the longitudinal inclination is less than about 1 in 100, the surface water will be difficult to drain away, and surface-water drains may be provided. With a longitudinal gradient of 1 in 50, or sharper, the camber may be flattened out considerably, as the natural surface drainage is obtained longitudinally. This flattening of cross-section should not, however, be carried too far, otherwise watercourses will speedily form down the centre of the roadway on steep gradients.

Suitable cambers for different surfaces under ordinary conditions are: Granite macadam, 1 in 25; tar-macadam, 1 in 30, or 1 in 40 on incline; creosoted deal paving, 1 in 36; hard wood and granite, 1 in 45; and asphalt paving, 1 in 50. The longitudinal fall of water channels should not be less than 1 in 100 for a granite channel, and 1 in 150 for asphalt.

IMPROVEMENT OF EXISTING ROADS.

Inadequate Foundations.—The majority of the old highways of this country have come into existence in a more or less haphazard fashion, and in the past the provision made for their maintenance has been uncertain and inadequate. The entire absence of foundations suitable for carrying modern weights brought upon the surface is revealed by the upward movement of the sides of the roadway into the channels—a weakness to be observed generally throughout the country.

Vast sums are now being spent in laying down expensive so-called waterproof surface crusts of various kinds, in order to give an immediate show for the money expended, but the writer is of opinion that wherever there is evidence of underlying weakness money may be more advantageously applied by first putting in proper foundations and drainage. However excellent, well laid or expensive may be the surfacing material, it can never prove really satisfactory on a weak foundation. There will be gradual but constant movement of the road crust, local sinkages of the central portion and rising of the sides, and generally the annual expense of wear and tear of the surface will be greatly enhanced in cases where no solid and unyielding foundation exists.

The initial cost of such work is, of course, necessarily heavy, but where suitable foundations do not already exist it is submitted that it is the only sound course to pursue, both from an engineering and financial point of view, and as essentially a capital work for which State grants on liberal terms should be made.

Thin Crusts.—The wisdom of recent practice in laying thin surface wearing crusts or armourings of asphalt and bituminous preparations over existing macadam surfaces is open to great question, except where an absolutely rigid and dry foundation can be relied upon. In the absence of this, most ordinary road surfaces are subjected to considerable movement under modern speeds and weights, and in these circumstances thin wearing crusts are liable to fracture and disintegrate. Great caution in the selection of a suitable site is necessary, except where laid on a good concrete foundation, which, unfortunately, in most cases, would make the cost of the work prohibitive.

Bituminous Methods.—In what are now known under the general name of "bituminous methods" the presence of coal-tar and pitch as the distinguishing feature, and the main object of all such processes is to exclude water from the crust of the road. These methods consist mainly in the revival and extended use of tar-macadam, pitch-grouting, tar-binders, and other like forms, and in suitable situations and conditions give very serviceable surfaces at a not unreasonable cost, but much discrimination is needed in their application.

The arch enemy of the tar-macadam road is the traction engine, and this cumbersome, vexatious contrivance is, unfortunately, rather in evidence in the writer's district, especially during the spring and early summer months. These engines, with destructive diagonal steel strips on the wheels, weigh over 16 tons on the road, and haul three lumbering wagons weighing about 12 tons each when loaded. Under this burden the very best of tar-macadam work suffers substantial damage. Even after having been laid many months the material, owing to its plastic nature, will slightly soften on a hot day, sufficient to permit of its being crushed out of shape and torn up under traffic of the class named.

A well-made granite macadam road surface withstands this class of traffic very much better than tar-macadam, or any of the bituminous processes.

To the enthusiast for tar-macadam, in addition to the above caution, the writer suggests that consideration of the following points will help to keep him out of trouble:—

(1) The quality of tar available for such work is very variable and unreliable, and requires constant watching to avoid failure.

(2) Good, fine weather is an important factor for successful work. If the weather is too cold there is great risk of too much tar being used, thus causing the tar-macadam to become very soft and easily damaged during the warm weather.

(3) Tar-macadam is hopeless on a weak, yielding foundation.

(4) It cannot be satisfactorily repaired during wet, cold weather. This is important in streets where much opening of trenches for gas, water, electric and other services is likely to be required.

(5) Where there is much traffic a continual watch must be kept on the work for some time after it has been completed, which considerably adds to its cost.

(6) Tar-macadam is liable to "creep" during hot weather towards the sides of the roads, especially in country districts, where the lateral support of a kerb and footpath is not usually available, and some provision to meet this tendency should be made.

(7) The cost of tar-macadam is, as a rule, much

* Paper read at the annual meeting of the Institution of Municipal and County Engineers at Cheltenham.

successful work.

much slippery mud during wet weather.

rial at the bottom, and finished with a fine grade for the surface. A coating of the thickness named is best laid in two layers, but there is no advantage in separating the fine and coarse grades; the same mixed grade material should be used for both coats.

Rolling of tar-macadam is best done with a light steam roller (6 or 7 tons weight), and there is nothing

Tar-macadam may be laid on gradients as steep as

clean. The degree of slipperiness experienced depends greatly on the weather and the skill of the driver.

It is a great mistake to lay tar-macadam or any other bituminous road surface over an existing mac-

scarifying the surface all over and consolidating by rolling to a uniform condition before the bituminous material is laid. Where this precaution has been neglected the old inequalities and potholes in the road crust will soon reappear on the surface of the newly laid coat, as the greater depth of bituminous material over the pothole consolidates more than the thinner coating around.

Experience of recent years has led to the settling down of much preliminary clamour about dust-layers to the very general use of coal-tar. This new demand has brought about a very substantial increase in the price of tar, and, with the continued extension of bituminous methods of road construction, the demand appears likely to exceed the supply, and so set a limit on this form of road improvement unless competitive processes are adopted.

The specially prepared tar for road surface painting

173 gallons to the ton. This is heavier than the weights recommended in the Road Board Specifications, but the tar is found to make very satisfactory work.

Tar-painting is not usually very successful on roads with damp, clayey subsoils, in shady situations, or under trees. A dry, sandy or chalky subsoil is the most favourable for the work, and in these areas operations can be started earlier in the season.

The heavy, complicated, costly tarring machines of early tar-painting days have almost disappeared in favour of much simpler plant and hand work, the latter giving the best results in this class of work.

For town work granite chippings ⅜-in. to ½-in. gauge make the best class of grit for covering the tar. Sand, though usually much cheaper, produces an increased quantity of mud and causes the tar-painting to tear up more readily under heavy traffic.

Shopkeepers—such as greengrocers, butchers and fishmongers—who expose their goods in the open do not usually appreciate the tar-painted road, and some light watering is occasionally necessary to cope with dust blown on to the tarred surface.

Increased attention is necessary on a tarred road to the picking up of horse-droppings and light litter, as these blow about much more readily than on an ordinary macadam road. The writer uses a number of light covered hand-barrows for this purpose on all tarred areas.

In his experience the amount of money spent on road tarring is about equivalent to the saving obtained in ordinary maintenance and wear and tear on the roadways, so that no increase on the total cost of highways arises, while a greatly improved surface is obtained during the summer and autumn months. Tar-painting gives most economical results on secondary roads, culs-de-sac, and other thoroughfares with light traffic, as, in some cases, the tarred surface remains in good condition for several years without repair, and very little attention of any kind is needed.

Repairs.—Systematic inspection of the roadways, and regular and prompt patching or

roller of the convertible tractor type, which is well

quire to be regularly patrolled and repaired, much in the same way as a railway track.

Old screened road metal of small gauge is well suited for patching, as it consolidates quickly.

Ordinary macadam surfaces should not be patched with tar-macadam, as, after a little wear, a most unsightly and intolerably bumpy surface results, owing to want of uniformity in wear of the variegated surfaces.

When recoating a roadway the thoroughfare should be closed wherever possible, and the whole width of road coated and rolled in one operation. Work of this class done in half widths is seldom satisfactory, as rapid wear invariably occurs at the central joint. In cases where this system cannot be avoided it is best, if possible, to first treat about two-thirds of the width, so as to keep the joint out of the centre of the road; but many roadways are too narrow to permit of this being done.

Weather conditions are among the most powerful factors influencing the wear and tear and deterioration of roads. Prolonged rain and heavy traffic following the break-up of frost immediately succeeding a wet period are particularly destructive.

In town streets where a macadam surface has to be renewed about every two years and patched frequently, a wood-paved surface will probably be more advantageous. A maintenance cost of 10d. per square yard per annum is about the economical limit for macadam, and, from the point of view of traffic weight, a load of some 250 tons per yard of width per day is about the maximum for an ordinary macadam surface.

Steam Rollers.—In the opinion of the writer the usual so-called "10-ton" steam roller is much too heavy for the majority of surface recoating work. These rollers, when loaded ready for the road, often weigh nearer 13 to 14 tons than 10, and frequently cause much damage to the new metalling by crushing and weakening it during the process of consolidation. In some cases metal is put on the hard crust of the old road without preliminary scarifying, and rolled down with a heavy steam roller, with the result that the stone, being severely crushed between hard surfaces, is permanently damaged at the outset, and the serviceable life of the new coat thus sadly reduced.

For much of this work the writer uses what is described by the makers as a 7-ton roller of the convertible roller-tractor type already referred to. This machine is found to be of the greatest service for all classes of work as well as for haulage. The small tractor roller can be moved quickly from job to job, and can be converted to a tractor in about a couple of hours. The cost of a first-class machine of this kind, including both roller and tractor gear, would be about £550. This roller, with awning, water, &c., fitted up ready for work on the roads, actually weighs

MECHANICAL HAULAGE FOR MUNICIPAL WORK.

Whatever may be the views held as to the desirability of public highway authorities employing steam, petrol, or other motor vehicles for haulage purposes, the writer has been practically compelled to do so on account of the difficulty experienced during the busy spring and summer seasons in procuring sufficient suitable horses. It is usually impracticable to keep, during the relatively quieter winter months, a full stud of horses sufficient to cope with all work during the busier period of the year, and such work as street watering and road tar-painting greatly accentuates the variation between winter and summer haulage demands. The hiring of the surplus summer requirements affords one way out where the horses can be got; but horse contractors are fast changing to mechanical haulage, thus greatly limiting the supply.

SLIPPERY ROAD SURFACES.

In these days of improved road surfaces, tar-painting, tar-macadam and such like, complaints are, perhaps, a little more frequent in respect of slipperiness, and requests for gritting or sanding are often made. The best plan to overcome slipperiness is to keep the surface as clean as possible by removing (and washing off, if necessary) stiff, pasty mud which is liable to accumulate during the foggy, damp weather of the winter months. Gritting and sanding greatly increases

the production of this stiff, slippery mud, as the surface is speedily crushed by the traffic. The depth of grit, therefore, should be done as sparingly as possible, but scarcely any of the surface should take place.

ROAD SIGNS.

Generally speaking, there is room for improvement in road direction signs. Frequently they are so placed that an approaching traveller cannot read the [illegible] and in some districts distinctive [illegible] should be at the most favourable angle, the letters not less than 3in. in depth, and the mileage stated in bold block figures to the nearest quarter. Strangers motoring long distances [illegible] impossible to quickly gather the name of the [illegible] passing through, and it would be a great convenience to have the name of the village or town boldly erected on the through roads near the commencement of the village buildings.

Signboards or posts are costly to erect and maintain, and the moving reflected image is liable to mislead a careless [illegible] unaccustomed to them.

It is a mistake to multiply danger and caution [illegible]. They should be confined to the most awkward spots and be erected by a public authority. No private signs should appear on a public highway. If too numerous the familiarity of their appearance leads to a general neglect of the warning intended to be conveyed.

CONDUCT OF TRAFFIC ON ROADS.

The education of the general public as to the altered conditions of use of roadways has not kept pace with the development of fast mechanical traffic. The change has been great, and the highways must henceforth be looked upon as lines of communication much in the same way as railways are regarded. Street accidents to pedestrians mostly arise from lack of caution and alertness in crossing, hesitation when halfway across the road, children playing in the road, and neglect of keeping to the "rules of the road."

MOTOR-OMNIBUS TRAFFIC.

There is no doubt that heavy motor-omnibus traffic on roadways is most destructive, and, in some cases, has more than doubled the cost of maintenance. In the writer's district motor omnibuses run frequently between practically all the principal outlying villages, and shortly after a new route has been started a marked increase of wear and tear of the road is apparent, especially in the number of potholes produced, for the creation of which heavy and fast traffic of the motor omnibus type seems to be peculiarly adapted.

Protective clauses in recent private Bills of promoting companies have been accepted by Parliament, empowering the road authorities concerned to recover from the motor-omnibus companies ¾d. per car-mile; but this contribution is inadequate to meet the increased cost of maintenance in some cases.

The tendency of motor-omnibus traffic travelling to and fro over a defined route is to keep to fixed grooves or tracks formed in the road surface, and thus produce longitudinal channels or wheel tracks, which spoil the contour and drainage of the road surface.

The degree of damage done depends upon the class of tyres used, the diameter of the wheels, the width of the rims, the balancing of the vehicle, the proper suspension of the weight of the vehicle by suitable springs, the relation between propelling power and weight, the action of the brakes, and other factors.

STATISTICS OF TRAFFIC.

The [illegible] record of traffic per yard-width of roadway does not in many cases give a true representation of the amount of wear and tear over a roadway. On roads through rural districts with [illegible] amount of traffic a very large percentage of vehicles keep to the centre of the road—in fact, the less the volume of traffic the higher will be the proportion using the centre of the roadway. Thus the sides suffer but little wear, while the centres soon become worn out. The average traffic record per yard-width does not therefore correctly show the conditions which obtain, and a minimum and maximum record is necessary to express the true facts.

Much the same thing often occurs on very wide roads, as a portion only of the width is used by a high percentage of the traffic.

On busy town roads of medium width the traffic is very fairly distributed, and it is mainly to this [illegible] that the average tonnage per yard has any reliable significance.

On some roads, owing to the nature of local industries, the night traffic is quite an important item, and should not be omitted if a true record of actual conditions is to be obtained.

COLLECTION OF INFORMATION, STATISTICS, ETC.

The collection of information and statistics, in reference to roads, traffic, materials, and other like matters, is a useful occupation from many points of view so far as it goes, but the road engineer should be cautious as to the conclusions he may safely draw from the collected data placed before him. So much depends on the actual conditions in any given case, and it does not by any means follow that because a road material has proved satisfactory or otherwise in one place it will necessarily do so in another. A new set of conditions will produce its own set of results, and the engineer must use his judgment in each case according to his local knowledge and experience.

EXPERIMENTS AND TESTS.

Laboratory and other indoor tests of road materials serve a useful purpose in arriving at the physical and chemical properties of the materials, and assist the engineer when the information so derived is seasoned and matured by practical experience on the road. Weather and traffic are of paramount importance in all road-making matters, and there is no test to be relied upon other than that of actual and adequate trial on the road under ordinary conditions of traffic, rain, frost, and numerous other disturbing influences to which any road material must necessarily be subjected.

CLASSIFICATION OF ROADS.

The existing division of roads into "main roads" and "other roads" can scarcely be considered satisfactory owing to the varying policy adopted in different counties in regard to the "maining" of roadways, and a proper classification on a uniform basis is desirable. Since the Local Government Act of 1888 the introduction of motor traffic has greatly altered the conditions in regard to the "through" use of the roads, is responsible for the heavy increasing burden of maintenance, and for the need of reorganising the sources from which a large proportion of the cost is derived.

ADMINISTRATION OF HIGHWAY MAINTENANCE.

Good administration, particularly in reference to the disposition of labour, materials, and plant, is one of the leading factors in highway maintenance essential to efficient and economical work. In urban areas suitably placed central depots, with railway sidings into which materials can be delivered direct, are a great convenience, and involve the minimum haulage of materials. In these days of frequent labour disturbances, as in the case of the railway, dock, and colliery strikes, the necessity of getting all materials on the spot well in advance of requirements has been greatly emphasised, in order that annoying delays may be avoided. Delay in any form means increased cost of the work in hand, frequently entails loss of good weather suitable for the work, and always gives regrettable inconvenience to the general public.

Wherever much work is in progress, constant inspection and supervision is a good investment, and to this end the inspecting staff should be provided with appropriate means of quick and convenient [illegible].

Local materials should be employed wherever of suitable quality, but some counties—*e.g.*, Kent—are particularly deficient in good quality stone suitable for first-class roads carrying considerable traffic.

Over "centralisation" of the practical work of road maintenance is not desirable. It is apt to lead to so-called "red-tape" methods, costly delays, and lack of individual attention.

Road maintenance should be carried out through the responsible highway authorities by the direct employment of labour, thus ensuring a local interest in the work, close supervision, and prompt attention, which is almost impracticable under any too distant and highly centralised system of administration.

Stereotyped standardised methods in many matters connected with road making and maintenance are to be deprecated. Such methods destroy the useful application of personal experience and judgment to individual cases, and so lead to mere routine and lack of interest. It is unlikely that there can be any universal solution of the road problem, inasmuch as local conditions and requirements, character and

extent of the traffic, and for means of obtaining new stone materials at reasonable cost, and the choice must ever be decided by facts in arriving at the most suitable and satisfactory method of treatment in each particular case.

ROAD MAINTENANCE AND REPAIR IN NORTHAMPTONSHIRE.

By Charles S. Morris,
County Surveyor.

The time is rapidly approaching when the present system of road maintenance in Northamptonshire, necessitating short lengths on every road each year—will have to be discontinued and a new system adopted of recoating each road from end to end as and when required. This does not necessarily mean any great increase in the total cost of maintenance—on the contrary, it will probably be cheaper—but simply that the bulk of the materials will be concentrated upon certain roads each year instead of being spread over the whole mileage as at present.

To some extent this policy has already been adopted as the council have in hand the entire recoating of the London Holyhead and other important roads, and it appears to me that the traffic of the present day will ere long demand the adoption of the principle to the whole of the main roads. Certain small surface repairs will doubtless from time to time be necessary to the roads so treated, but it is obvious that roads recoated throughout in any one year will at a given period again require resurfacing throughout, and cannot be dealt with in sections as at present. From a traffic point of view there is a distinct advantage in having the whole work of renewal of each road carried out in a given year, with no further obstruction by road repair operations for several subsequent years, in addition to the truer and continuous surface which can be obtained and maintained by this method.

Existing Difficulties.

With the present method it is a most difficult matter to make a satisfactory joint at the ends of each "Tarvia-ed" coating, which has to be taped off, and even when this is carefully done the more rapid wear of the older water-bound portion soon produces a "step," which is most unpleasant to drive over, and gets more pronounced every day. Patching is of little use, as, unless a bituminous material is used, it is soon worn away, and the application of such material very soon results in the same effect. This applies also to patching water-bound roads with Tarvia or tar-macadam; even when the work is most carefully done and made perfectly level with the surface, in a very short time the greater rate of wear of the older water-bound portion causes the patches to stand up in a series of humps which are nearly as unpleasant to drive over as the holes they have replaced. Patching with ordinary metal is useless, except during very wet weather, as the fast traffic simply throws the metal out of the holes all over the road, where it is ground to dust by the heavier vehicles.

All these difficulties in retaining a true and even surface tend to show the necessity for adopting some form of bituminous or other binder which cannot be easily displaced by fast traffic, and which can be readily and satisfactorily repaired when damaged. The volume, weight, and speed of the traffic on the main roads is undergoing a remarkable change, and we are now faced with the fact that the majority of the existing water-bound roads are totally inadequate to carry the ever-increasing motor traffic. The advent of heavy motors and tractors sorely tried the roads, but the addition of motor bus services has proved the "last straw." Many of the roads, which a year or two ago were in a very good condition, have been almost ruined by the passage of these vehicles, and there is apparently no option but to reconstruct them with a bituminous binder. The work of reconstructing and widening about 50 miles of the principal roads is now in hand, but I notice that many other of the main roads are showing evidence of considerable damage, and the council must ere long be prepared to meet a large expenditure on these roads. It is a "penny wise" policy to allow a road to be practically destroyed before carrying out the repair or reconstruction of it, as the longer the work is delayed the more costly it will be. It is far cheaper to recoat a slightly worn road than to reshape a rutted or hole-bound road before recoating.

Reconstruction Schemes.

Many county councils have submitted to the Road Board schemes for the reconstruction of their principal main roads, and although Northamptonshire has also done so in some 20 miles, the time is rapidly approaching when a further scheme will be necessary for the widening and resurfacing of a considerable portion of the remainder. Apart from the financial side of the question, towards which the Road Board will no doubt give substantial help, the greatest difficulty will be to obtain a sufficient supply of materials, as the granite quarries from whom our present supplies are obtained have in almost every case more orders than they can deal with, and to go farther afield for materials will mean a large addition to the cost of the work. This difficulty, however, will probably be overcome, providing sufficient notice is given of our requirements, as many of the quarry owners would put down additional machinery if the demand for road material warranted it. The work of reconstructing a large mileage of roads cannot be taken in hand at a few weeks', or even months', notice, as there is an enormous number of details to arrange before the work can be commenced, and the work cannot be efficiently and economically carried out unless sufficient material is obtained in advance to keep the men and steam rollers fully employed. I therefore propose to submit such a scheme to the Roads and Bridges Committee during the current year in order that we may not be faced with the difficulty of having to deal with this matter at short notice, or when the roads have been so damaged as to entail a very large expenditure to restore them.

The total cost of the whole of the works on the county main roads . . . amounts to £131·07 per mile, and the nett cost to the council £91·26 per mile. The estimated expenditure for the current year is £5,882 gross and £3,660 nett, or £175·64 and £105·89 per mile respectively.

Waterproofing of Cement. In the new municipal swimming baths which are being erected in Salisbury, Rhodesia, the cement waterproofing powder Pudlo has been specified.

Proposed Walsall Improvements.—The Walsall Corporation Bill, which seeks powers with regard to tramways, trolley vehicles, motor omnibuses street improvement and the construction of a new street, and to make further provision in connection with the local gas and electricity undertakings was, on Monday, ordered for report and third reading by a Committee of the House of Lords.

A Glossary of Road Terms. By H. Percy Boulnois. Manstead St Bride Press, Limited, 24 Bride-lane Fleet-street, E.C. Price 2s. Mr Boulnois has achieved far more than he may imagine by this production of his pen. He set out to standardise the nomenclature of road terms; in addition he had made a valuable addition to English literature. To the uninitiated it is like reading a new language: Mr Boulnois says it isn't anything like "complete." At any rate, it is a valuable *vade mecum* which no one has attempted before.—*Portsmouth Times.*

Berkshire Roads.—In his ninth annual report, Mr. J. Frod. Hawkins, county surveyor of Berkshire again draws attention to the damage caused to the surface of the roads in the county, especially in the North District, by traction haulage and carting from the fields on to the roads during wet weather and after slight frosts, no attempt being made by the carters to scrape the mud from the wheels. Mr. Hawkins points out that if more consideration were shown the surface would not be licked up and that there would be a saving in the cost of repairs, as these lengths would require sheeting less often. It appears from the report that the Newbury, Ilsley, Abingdon, and Oxford road is fast becoming one of the most important roads in the county. Originally, practically only a sheep track, it has now become the main trunk road from Southampton to the North, and will at an early date require reconstruction. "This expense," the county surveyor observes, "would certainly be beyond the finances of the county, and when such reconstruction is undertaken a large portion should be borne by the Road Board."

The Surveyor

CROYDON RELIEF ROAD.

THE SCHEME NOT TO BE ABANDONED.

The scheme for the making of a relief road for Croydon—a by-pass road from Thornton Heath Pond to Purley—is now, in all essentials, again at the stage at which it was before the Local Government Board inquiry, reported in our issues of May 23 and May 30, 1913. The Local Government Board has refused to sanction the loan representing Croydon's initial share in the enterprise, and, without condemning the scheme, takes the view that Croydon's share is too large. The Road Board has now, however, offered to grant an additional sum of £19,000 towards the cost of the road, bringing the board's total contribution up to £49,000. That this additional sum will be expended on additional works not in the original estimates does not alter the fact that Croydon's £20,000 now becomes a somewhat smaller proportion of the whole sum to be spent. On this ground the Croydon Borough Council decided, at a recent meeting, again to ask the Local Government Board to sanction the expenditure.

Essentially, therefore, the position is unaltered, though the additional expenditure on the junction of the relief road and the existing main road at Purley makes the project a better one from the engineering point of view. The Ecclesiastical Commissioners have raised their contribution from £5,000 to £7,000, but it is understood that this is with the stipulation that certain works shall be carried out, the cost of these being estimated at about £1,450. The closing of a bridle road is also made a condition of this offer, and as opposition to this course is to be expected it is probable that the borough council will refuse the offer of the commissioners.

The total cost to the borough must, in the first place, be discounted by the fact that certain works of improvement, estimated at £24,000, would probably be regarded as necessary in any case in the near future, these works being included in the scheme. On the other hand, the responsibility of the borough would not be limited to its contribution to the capital cost. The borough would have to maintain the road and light it, and would also, when and where necessary, have to carry out sewering and the kerbing and channelling of those parts of the road not provided for in the estimates. It is impossible to forecast the probable amounts of Imperial and Road Board contributions towards maintenance, but these might be important. As regards such civic developments as the borough may put in hand, it is difficult to understand the position of those who oppose the scheme on the ground that there may be heavy expenditure in this direction. If the borough develops the road as a street and puts in sewers, it will only be because these works are needed, apart from the question of the road as a thoroughfare. The advocates of the scheme cannot be held responsible for the possibility that the mere existence of the road may induce the borough into unjustified expenditure, which is what the opponents of the project are afraid of, if there be any reason in their objections on this score.

The present estimate is in excess of the cost of the road as a by-pass for through traffic. The proposed width of 40-ft. carriageway is much greater than the widths of the present main road in its narrower stretches, and yet these widths fully suffice for through traffic, as may be proved by observation at times when there is much through traffic but very little local traffic. The congestion is caused by standing vehicles, and partly by cross-traffic when Croydon itself is busy. A 20-ft. road, even if it took three-quarters of the through traffic, would amply suffice for present needs, and there are several places on the route where the saving in cost by adopting a width of 20 ft. or 25 ft. would be much greater than that represented by the reduction in width of the carriageway itself.

From the economic point of view the project is an excellent one if it be regarded as confined to the provision of a road for through traffic, provided with wide footways, which could be made narrower in the future if the amount of traffic became much greater; but, regarded as a civic speculation, the scheme is weak, inasmuch as considerable parts of the route are in land that does not lend itself to building developments of a suitable kind—that is, of a kind that would justify the provision of a main street, kerbed and channelled, and used as a trenching ground for sewers, water pipes, and other conduits. If the Local Government Board were prepared to take the view that the civic speculation is justifiable, the matter could properly be left to the local authority. But this is not now the position, and it seems hardly likely that the board will be impressed by the slight reduction in the proportion of Croydon's initial share of the cost. The attitude of the board suggests, on the contrary, that some other solution would be more acceptable. One solution would be for the Road Board itself to make the road, in which case it might be decided to reduce the scheme to the provision of a relief road only, making no provision for a street with house or shop frontages. The other solution would be for the borough council to adopt a similar policy, in which case, if the Road Board were prepared to maintain its grant at the amount at present offered, Croydon's share in the initial cost would be reduced to a very small sum, or to zero, and the responsibilities of the borough for future works and for maintenance would be also greatly reduced.

Toronto Sewerage Scheme.—The new sewerage system for North Toronto, which the city must construct under the terms of an agreement by which the township of North Toronto was annexed to the city, is estimated to cost more than £800,000. Two systems were considered originally; one contemplates separate sewers for storm overflow and for ordinary purposes, at a cost of more than £1,200,000. The alternative system, which is the one recommended, will have sewers to serve both purposes, at an estimated cost of £823,851. The system is to be in two divisions, one with lateral sewers, trunk sewers, outlets and disposal plants. The sewage from the lateral sewers—144 in number—will flow into thirteen local trunk sewers, extensive enough to provide for the future development of the district. The sewage disposal plant will include tanks for the treatment of storm water and Imhoff tanks for sewage, and the plant will be so built that additions can be made as required without disturbing the general plant. The second division of the system, states the *Contract Record*, will be somewhat similar. There will be 139 lateral sewers, seven local trunk sewers, two storm outlet sewers, and one outlet sewer.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to the Editor, St. Bride's House, 21 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section," as the Editor and publishers are not invited to submit problems for consideration and answers to the questions which appear for the contributions considered to be the most useful. Prizes, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

QUESTIONS.

Last week answers are invited to the following questions:

405. Disinfection. Sketch and describe a form of [illegible] suitable for use in a town of 30,000 inhabitants.

407. Surveying. Describe a method of setting out curved curves by means of offsets. (M.C.E.)

409. Road Construction.—Give a specification for the conversion of a [illegible] into a granite setted road suitable for heavy commercial traffic. (Junior.)

410. Removal of Sand Bar.—A certain stream which discharges into the sea has become silted up, and stranded at its mouth, by the formation of a sand bank 100 yds. by 10 yds. by 3 yds. What steps should be taken to prevent a nuisance, and to insure that the stream will be self-cleansing by the action of the tides? (Steeplus.)

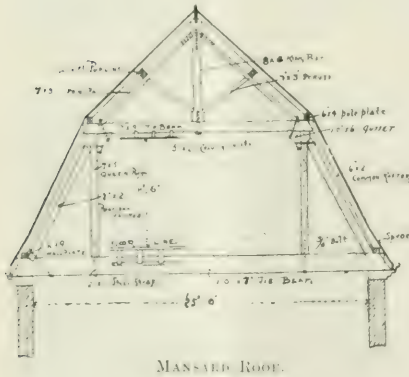
411. Foundations for Chimney Shaft.—What calculations are necessary for finding the width and depth of concrete for the foundation of a square furnace chimney shaft, 150 ft. in height, on a gravel soil, and built in accordance with the London Building Act, 1894? (Student.)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

406. Building Construction.—Sketch a mansard roof, showing timbers; also a dormer window in an ordinary roof. (Junior.)

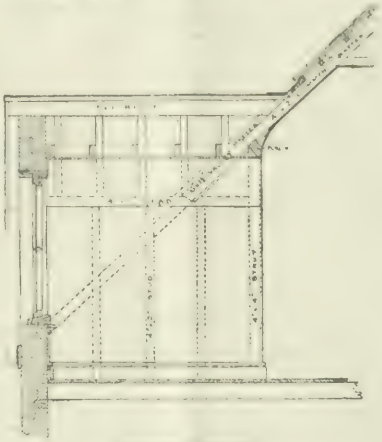
In a mansard roof the king-post truss is placed immediately over the queen-post truss. Sketch shows mansard roof in detail, but the timbers shown in the sketch would be sufficiently strong for a roof of 35-ft. span. The tie beams, queen-posts and



Mansard Roof.

king-post, principals, &c., should be of pitch-pine. The sketch shows two gusset pieces to reduce the stresses upon the fastenings. Mansard roofs are used in large buildings to obtain the maximum amount of cubic space without obstructing light and air. (Sanitas.)

The following sketch shows a dormer window in an ordinary roof.



Dormer Window.

ARCHITECTURAL COMPETITION.

AUSTRALIA'S FEDERAL PARLIAMENT HOUSE.

The Australian Government announces an international architectural competition for the purpose of selecting the architect of the Parliament House, and, possibly, incidentally an additional architect for other Government structures of the new Federal capital city, Canberra.

Only tentative outline sketch designs for the building are requested, and eight prizes, aggregating £6,000, are offered, the first being £2,000, in addition to commission for service at the scale of the Royal Institute of British Architects.

The designs may be submitted in either Melbourne or London by the end of March, and will be judged by the following jury of architects, whose decision will be final: Messrs. George T. Pope, of Australia; John J. Burnet, of London; Victor Laloux, of Paris; Otto Wagner, of Vienna; Louis H. Sullivan, of Chicago.

The programme will be issued to any practising architect on application to the High Commissioner for Australia in London or any British Ambassador to whom copies are being forwarded.

International Municipal Conference.—The mayors of some of the most important cities of the United States, together with a number of ladies and gentlemen identified with municipal matters, will arrive in London this week end, and on Monday next will attend the opening of an International Municipal Conference at the Anglo-American Exposition, Great White City, Shepherd's Bush, London, W., with Viscount Peel, the chairman of the London County Council, as president. A number of mayors from various parts of the United Kingdom, and members of city and borough councils, municipal officials, together with a large number of persons interested in municipal self-government, have accepted the invitation sent out by the Earl of Kintore, chairman of the Executive Committee of the Anglo-American Exposition, to attend this conference, and it is hoped that the result of the deliberations will have an important influence upon municipal matters generally. The conference will sit from Monday, the 20th, till Saturday, the 25th, from 10 a.m. to 5 p.m.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Ammanford U.D.C. (July 14th. Mr. P. M. Cross-Clarke).—£1,400 for the construction of a steel bridge over the Loughor at Manly, Pantyffynon. It was stated that the bridge is estimated to cost £3,500, and that contributions had been promised towards it by Carmarthen County Council £1,000, Swansea Rural District Council £300, Llanelly Rural District Council £250, Pontardawe Rural District Council, £250, and the Buckley estate £75.

Darlington T.C. (July 13th. Mr. R. H. Bicknell).—£11,400 for works of private street improvement, £8,372 for resurfacing streets with tar-macadam and £3,991 for the widening and improvement of Haughton-road.—With respect to the Haughton-road scheme, it was stated that the road was part of the main road from Barnard Castle to Stockton. The North-Eastern Railway Company proposed at an early date to centralise their goods departments on land on the south side of the road, and the result would be that the heaviest traffic in the borough would be diverted on to this road.

Dublin T.C. (July 7th. Mr. P. C. Cowan).—£77,800 for electricity purposes, and £5,000 for the public lighting department in connection with the conversion of gas lighting to electric lighting.—Mr. Allan, secretary of the Electricity Committee, said the period of "speculative extensions" was at an end, and it had been decided, the Board of Trade having given sanction, to try the new system of suspension lighting now becoming so popular in England. This system would, he said, be adopted in narrow streets running off main thoroughfares.

Hull T.C. (July 14th. Mr. Geo. L. Pepler).—This was an inquiry into an application by the town council for authority to prepare a town planning scheme, partly within the city and partly within the rural district of Sculcoates, under the Town Planning Act of 1909.—The deputy clerk, Mr. G. C. Knox, stated that under a scheme of town planning the corporation hoped to have the power to limit, to a reasonable extent, the number of houses that should be erected on a given unit of land, and so prevent the creation of slums. They hoped to have the power to control the style of construction of buildings, and to decide where offensive trades and factories should be placed. The area with which it was proposed to deal was situated on the north-eastern boundary of the city, containing 913 acres, and was very likely to be developed at an early date.

Llanelly R.D.C. (July 15th. Mr. P. M. Cross-Clarke).—£41,253 for sewerage and sewage disposal in Llanelly and Pembrey. Mr. E. J. Silcock, Westminster, the engineer, gave details of the scheme, and Dr. Evan Evans, medical officer of health, testified that the proposed works were necessary in the interests of the public health.

Midhurst R.D.C. (July 13th. Mr. R. G. Hetherington).—£780 for the purchase of land and the erection of four cottages in the parish of Chithurst, under the Housing of the Working Classes Act.—The inspector stated that, according to the board's reckoning, there would be a deficit of £7 3s. "Supposing it is necessary to make the two sides of the balance-sheet tally," he said, "what do you suggest—reduce the cost or increase the rent?" The clerk, Mr. J. M. Furneaux, replied that he thought the council would be inclined to raise the rent to 4s. 3d. or 4s. 6d. They did not want to erect jerry-built cottages. He thought there would be a demand for the cottages at a higher rent. Mr. A. G. Gibbs (surveyor), Dr. S. Child (medical officer), and Mr. S. E. Stratford (sanitary inspector) gave evidence in support of the scheme.

Wellington U.D.C. (July 3rd. Mr. W. O. E. Meade-King).—£2,038 for the erection of new council offices, a fire brigade station, and public conveniences in the centre of the town, on a portion of the land recently occupied by houses which had to be pulled down for the widening of North-street and the town hall corner. Mr. Howard, the architect of the new buildings, gave details of the scheme and presented the plans.

APPLICATIONS FOR LOANS.

Bournemouth T.C. £1,000 for drainage and other works at the cliffs.

Beckenham U.D.C. £2,800 for the extension of the recreation ground.

Chapel-en-le-Frith R.D.C.—£2,000 for works of sewerage.

Croydon T.C.—£19,000 for the council's share of the cost of the proposed relief road from Thornton Heath to Purley.

Cudworth U.D.C. £6,000 for works of sewage disposal.

Harrogate T.C.—£2,177 for private street improvement.

Harwich T.C.—£2,140 for workmen's dwellings.

Heckmondwike U.D.C. £200 for electricity mains.

Horbury U.D.C.—£4,000 for a public hall.

Lisburn U.D.C.—£3,500 for the provision of a technical school.

Loughborough T.C.—£640 for a school clinic.

Richmond (Yorks) R.D.C.—£700 for works of water supply.

Swansea T.C.—£101,990 for the erection of 500 workmen's houses.

Ulverston R.D.C.—£700 for works of sewerage.

Wakefield T.C.—£4,440 for street widening and improvement.

LOANS SANCTIONED.

Bideford R.D.C.—£2,346 for a housing scheme.

Brighton T.C.—£1,500 for alterations to the North-road electricity station.

Edinburgh T.C.—£220,000 for the purposes of the electricity undertaking.

Grantham T.C.—£448 (for thirty years) for cemetery extension.

Halstead U.D.C.—£1,500 for the erection of six workmen's dwellings.

Hampton U.D.C.—£1,150 for the construction of an open-air swimming bath in Bushey Park, to be repaid within twenty years. The work is to be carried out departmentally under the surveyor, Mr. S. H. Chambers.

Littlehampton U.D.C. — £710 for public conveniences.

Lowestoft T.C.—£3,800 for an open space.

Melton Mowbray U.D.C.—£2,150 for the provision of a refuse destructor.

Poole T.C.—£250 for a refreshment pavilion in the public park.

Rochford R.D.C.—£750 for workmen's dwellings.

Swinford (Ireland) R.D.C.—£16,791 for labourers' cottages.

Turton U.D.C. — £8,735 for works of sewage disposal.

Winchcomb R.D.C.—£17,000 for works of water supply.

MARSHALL STEAM TRACTORS.

At the Highland and Agricultural Society's Show, which opened at Hawick on Tuesday, Messrs. Marshall, Sons & Co., Limited, Britannia Ironworks, Gainsborough, are the exhibitors of a 7-n.h.p. traction engine, a 5-ton steam tractor, a portable engine, and three threshing machines.

The traction engine is the firm's usual single-cylinder type, for 150 lb. working pressure, with gearing arranged on the three-shaft principle, designed for two speeds and incorporating the "Marshall" four-pinion system of differential gear.

The steam tractor, 5-ton compound type, with side-by-side high and low pressure cylinders, conforms in every respect with the requirements of the Heavy Motor Car Order. All the mechanical details are compactly arranged, but at the same time careful attention has been bestowed to ensure the requisite accessibility to parts requiring periodical supervision.

The firebox of the boiler, which is constructed for a working pressure of 200 lb. per square inch, incorporates the firm's cambered crown, a design which, it is claimed, considerably reduces the gross weight of the engine by the abolition of girder-roof stays. It also promotes economy in fuel consumption, and prolongs the life of the firebox, as, owing to the fact that the crown of the firebox is easily accessible, it can be readily kept clear of deposit, and therefore at its maximum efficiency.

Mechanical Filters.—Messrs. Mather & Platt, Limited, Manchester and London, have issued a new booklet dealing with their patent mechanical filters. Among the distinctive feature of the filters in question are a special washing gear, and the reduction to a minimum of the quantity of wash water. All the valves of the apparatus are at one level, and can be operated from the ground.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Have we not reached the stage in town planning when we could do with fewer papers and discussions? Has not the time arrived for more action and less talk, and are we not rather glutted with information and advice upon the subject?

* * * *

How long will it take us to find out what the working classes really want in the way of accommodation in their dwelling houses? Do they or do they not require a parlour, or is a living-room-kitchen the acme of their wishes? Do they require a bath, or is it only used as a coal receptacle? Is a washhouse a necessity, and in the country must they have a bicycle shed? Are not these and many other questions the problems that beset the designer of the model "workman's dwelling"?

* * * *

Would it not be well if there could be given many more papers of the eminently practical type of Dr. John Cox's at the Blackpool Congress on the "Destruction and Prevention of Household Pests," in which he gives very simple and useful suggestions as to the manner in which rats, mice, blackbeetles, bugs, earwigs, mosquitoes, flies, &c., can be destroyed and their breeding minimised?

* * * *

May not the same be said of Mr. W. C. Tyndale's paper on "The Sanitation of the Country House," in which the author points out the various defects to be found in so many large country mansions, and the simple manner in which these defects may sometimes be remedied under skilful advice?

* * * *

Would not the Admiralty be well advised to ascertain if Dartmouth is in the insanitary condition pointed out by one of the Local Government Board's medical inspectors, with a view to placing it "out of bounds" for the cadets at the Naval College? Whence does this institution receive its milk and food supplies? And should not the "authorities" be on the alert?

* * * *

Why is the present period called "the age of stress and rush" when nearly everybody takes a tram, 'bus, tube or taxi whenever they want to go even a short distance? Was not the real age of stress and rush when people had to walk instead of riding luxuriously in a vehicle as is now the custom?

* * * *

How long will Londoners put up with the dislocation caused to traffic by the leisurely manner in which all street work in the Metropolis is carried out? For instance, when will the work in Fleet-street, which has already seriously disturbed the traffic for months past, be finished?

* * * *

Is it a fact that there is now on the market a sand or metal drying machine which will dry and heat sand to a temperature of 600 deg. Fahr. at the rate of 1 cwt. per forty-four seconds, or 4 tons per hour, or 12 tons of metal in the same time? If so, will it not greatly assist in the construction of roads on modern lines, and tend greatly to cheapen their cost?

* * * *

Have not the North Country members of the Institution of Municipal and County Engineers some cause to complain that the presidents are not often chosen from the North, when it is considered that out of the last seventeen presidents only one came from a town north of Crewe?

* * * *

How many surveyors interested in the important question of housing of the labouring classes in rural districts went to see the exhibition of designs for country cottages at the Surveyors' Institution? Was it not a very public-spirited action of the proprietors of *Concrete and Constructional Engineering* to offer upwards of £200 in prizes for the best designs of cottages built of concrete which could be erected for £125, and give the accommodation of parlour, kitchen, scullery, three bedrooms, and the necessary sanitary accommodation? But could any of the designs which were shown be erected for the money under the present wages difficulties?

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works on which particulars appear below:—Buildings: Barnsley £20,000, Derbyshire £12,000, Pittenweem £11,000, housing and town planning: Nottingham; roads and materials: Bradford; sewerage and sewage disposal: Audley £8,000, Morpeth £10,000, Skipton £8,700, water, gas and electricity: Birmingham.—Particulars of other works projected will be found in our "Local Government Board Inquiries" pages.

BUILDINGS.

Amesbury R.D.C.—The surveyor, Mr. J. T. Hewens, has received instructions to prepare specifications for the proposed bridge at Newton Tony. The plan provides a roadway of 22 ft., with a clear waterway of 12 ft., and the bridge is to be erected immediately in line with the road to the railway station.

Ballymoney U.D.C.—The council have received a report from a committee on the proposal to establish a public abattoir, and have adjourned the consideration of the matter.

Barnsley T.C.—The council on Tuesday adopted the recommendations of the special committee on the new town hall scheme, estimated to cost about £20,000.

Belper R.D.C.—The surveyor, Mr. Robert C. Cordon, reported recently that he had received fifteen sets of plans for the construction of a bridge over the river Derwent at Allestree. They were referred to the special committee appointed to deal with the scheme.

Derbyshire C.C.—It has been agreed to build a new stone bridge over the Derwent at Baslow, according to plans prepared by the county surveyor, Mr. J. W. Heaton, the cost being estimated at £12,000.

Gower R.D.C.—It has been agreed to borrow £1,900 for the construction of a sea wall at Penclawdd to protect the main road from the encroachment of the sea at high tides. Mr. F. H. Glynn Price, the Duke of Beaufort's agent, has given permission for the widening of the road at the danger spot by 40 ft.

Hammersmith B.C.—As part of a larger scheme it is proposed to build a one-story building for the official staff, at an estimated cost of £6,000.

Harwich T.C.—The tender of Messrs. James & Ling, of Dovercourt, at £459, has been accepted for the completion of the groyne and landing-stage at Dovercourt.

Manchester T.C.—The Baths Committee have instructed the city architect to prepare plans for wash baths and wash-houses on a plot of land near Lower Moss-lane, Hulme.

Pittenweem T.C.—The council have adopted a scheme, estimated to cost £11,000, for the erection of a new town hall.

Ramsgate T.C.—It is proposed to extend the lavatory accommodation at the cliffs, at an estimated cost of £965.

Romford U.D.C.—It has been decided to construct a public convenience at Laurie-square, at a cost of £950.

Selkirk T.C.—The council have accepted the gift of swimming baths from Provost Allan and a number of other gentlemen, and have consented to allocate a site for the buildings.

Southampton T.C.—A resolution has been passed approving in principle that improved municipal offices should be provided at an early date, and a special committee has been appointed to go into the question.

Wandsworth B.C.—The provision of a mortuary and coroner's court is still under consideration. Some months ago the council accepted the offer of the London County Council to sell a site, with frontages to York-road and Barchard-street, for the sum of £1,210, provided an arrangement could be arrived at by which a coroner's court could be erected in conjunction with a mortuary, the London County Council paying a sufficient rent for the use of the court. At the suggestion of the London County Council a conference was held between their architect and the borough engineer, Mr. P. Dodd, and certain modifications were made in the plans. The estimated cost of the building, according to the modified plans, is £6,140, of which £3,762 is attributable to the coroner's court (including £692 for the site), and £2,378 for the mortuary (including £518 for the site).

Witham U.D.C.—The question of converting the old town reservoir into swimming baths has been referred to the Waterworks Committee.

HOUSING AND TOWN PLANNING.

Alcester R.D.C.—A scheme has been adopted for the provision of twelve workmen's cottages.

Crewkerne U.D.C.—The surveyor, Mr. B. Slade, has received instructions to complete plans and prepare tenders for twenty workmen's dwellings.

Gildersome U.D.C.—Plans and designs are invited for the erection of twenty houses at from £200 to £270 apiece.

Harwich T.C.—The council have approved the plans and specifications of the borough surveyor, Mr. F. H. French, for the erection of workmen's dwellings in the parish of St. Nicholas. Scheme I. consists of eight houses, to be built at a cost of £1,760, including the price of the land and legal costs, and Scheme II. of two houses at an inclusive cost of £380.

Horsham R.D.C.—The Local Government Board have approved generally of the council's housing proposals for Cowfold.

Irvine T.C.—A somewhat extensive housing scheme has been adopted, including the provision of ten double cottages and fifteen blocks of houses.

Londonderry No. 2 R.D.C.—A scheme has been passed for the erection of thirty-seven additional cottages.

Nottingham T.C.—The council on Monday adopted the scheme of the Housing Committee for the erection of workmen's houses in the Carter-gate area. The scheme involves the construction of several new streets.

St. Columb R.D.C.—A decision has been reached to build six workmen's dwellings on 2½ acres of land at Trekenning Four Turnings, which have been purchased for £200.

Stafford T.C.—A site costing £1,730 has been purchased for the erection of workmen's dwellings.

Taunton T.C.—The Health Committee have been empowered to advertise for tenders for the erection of twelve more workmen's dwellings in String-lane, similar to the existing houses erected by the council, but they have been asked to consider the principle of limiting the erection of future houses to the borough boundaries.

ROADS AND MATERIALS.

Antrim C.C.—A sum of £120 has been voted for the improvement of the footpaths of Carrickfergus.

Ballycastle R.D.C.—The council have agreed to a proposal to construct 8 miles of new road between Ballycastle and Cushendall, by Cushleake, subject to a grant from the Road Board of half the cost.

Barnard Castle R.D.C.—The surveyor, Mr. L. Simpson, has received instructions to carry out a scheme of improvement in Harwood-road.

Bradford T.C.—The purchase of properties in various streets has been sanctioned by the council for the purpose of schemes of widening and improvement.

Dawley (Salop) U.D.C.—A revised scheme, estimated to cost £297, has been adopted for road repairs at Jigger's Bank, and the county council will be asked for a contribution.

Dublin T.C.—For the more effective sweeping of the roads the Cleansing Committee intend to provide motor water wagons and an electrically-driven sweeping machine.

Dunbar T.C.—The Road Board have sanctioned a grant of £200 and a loan of £1,200 for a road improvement scheme.

Dundalk R.D.C.—Improvements estimated to cost

Essex C.C.

Fareham R.D.C.—The surveyor, Mr. J. F. Whitear,

Huyton-cum-Roby U.D.C.—Powers have been

Lewisham B.C.—It was stated recently, in the course

mittee, that in the last two years the borough

nearly £40,000 on the roads, and all they had re-

Littlehampton U.D.C.—The Road Board have

Melton Mowbray U.D.C.—It has been agreed to

Rugby U.D.C.—The dangerous corner at the top of Sheep-street is to be improved under a scheme of

it having been agreed to pay £1,900 for the land necessary for this purpose.

Totnes T.C.—An intimation has been received from the county council that they are prepared to defray half the cost of widening High-street, after deducting the Road Board grant of £1,000, their contribution not to exceed £1,250.

SEWERAGE AND SEWAGE DISPOSAL.

Audley U.D.C.—The consulting engineer, Mr. M.

sewage disposal scheme for the Audley side of the district, at an approximate cost of £30,000. At the same time the council have approved a scheme for the Talke portion of the district, estimated to cost £8,000.

Battersea B.C.—It has been agreed to proceed with

Belper R.D.C.—It has been resolved to carry out

Bulkington U.D.C.—The plans of a scheme of sewerage have been completed and forwarded to the Local Government Board for approval.

Chipping Norton T.C.—The corporation have received the formal sanction of the Local Government Board to the new scheme of sewerage and sewage disposal, and have instructed the engineers, Messrs. Berrington, Son & Watney, of Wolverhampton and Westminster, to invite tenders for the carrying out of the scheme.

East Molesey U.D.C.—A scheme of flood prevention

East Westmorland R.D.C.—The council have instructed Messrs. Taylor & Wallin, civil engineers, of Newcastle-upon-Tyne and London, to prepare a scheme for, and report fully upon, the drainage of a section of the village of Tebay, including the railway station.

Hendon U.D.C.—Referring to the receipt of tenders for works of extension at the sewage farm, which had been referred to the surveyor, Mr. S. S. Grimley, for tabulation and report, Councillor Ford, at a meeting recently, said now that they had got the result of the work of the surveyor and his staff on this big scheme, he thought the occasion a fitting one on which to record on the minutes a vote of appreciation of the work carried out in the surveyor's department, and he formally moved that. Nothing he could say would add to what they all knew of the work that the surveyor and his staff had put in. Except in so far as they were compelled for the purposes of the Provisional Order inquiry to seek outside advice, the work had been done entirely in the surveyor's department, to the saving of a very large sum of money, something considerably more than the whole of the salaries of that department for a year. He thought the council should record its appreciation of that work. Mr. Ford said it was the biggest single scheme they had in hand in the district, and would be so for some time. Councillor Gardner seconded, and

Leyburn R.D.C.—As a result of a report by one of their inspectors, the Local Government Board have made a series of recommendations for the improvement of the Leyburn sewerage.

Mexborough U.D.C.—For the sewage works extensions now being carried out by the council, under the engineer, Mr. Fenwick Carter, an order has been placed with Adams-Hydraulics, Limited, York, for two of their "Cresset" sprinklers, each of 116-ft. diameter. The contractor is Mr. Cliff, of Mexborough.

Monaghan U.D.C.—The Local Government Board have forwarded to the council the copy of a report by one of their inspectors, Dr. Bryan O'Brien, stating that the sanitary condition of the town was very bad, and could only be remedied by a proper sewerage system.

Morpeth R.D.C.—A scheme of sewage disposal is to be carried out at an estimated cost of £10,000.

Northallerton R.D.C.—The surveyor, Mr. T. G. Easdale, has received instructions to prepare the plan of a scheme of sewerage for Osmotherly.

Prestatyn U.D.C.—The council have adopted a sewerage scheme proposed by Mr. Blizard, consulting engineer, subject to the acceptance of a scheme already adopted provisionally for a discharge on ebb tide only.

Romford R.D.C.—The council have referred to the Upminster Parish Council a report by Mr. W. Fairley, consulting engineer, on the proposed scheme for the drainage of that district.

Skipton U.D.C.—The council on Tuesday approved of extensions to the sewage works estimated to cost £8,700. The scheme provides for an additional sedimentation tank, two new filters, 95 ft. in diameter, a storm-water tank, four humus tanks, and an additional sludge lagoon. When the proposed works are completed they will deal with a dry-weather flow of 700,000 gallons per day. Application is to be made to the Local Government Board to sanction the scheme and the borrowing of the money.

Walsall T.C.—On the presentation of the Sewage Farm Committee's report on Monday, the committee and the borough surveyor (Mr. J. Taylor) were congratulated on the completion of the new sewage purification works for less than £30,000.

Warwick T.C.—It has been found necessary to increase the loan for improvements at the sewage disposal works by £1,000.

Wealdstone U.D.C.—The council have accepted the tender of Adams-Hydraulics, Limited, York and Westminster, for six of their "Cresset" revolving distributors. The engineer is Mr. Herbert Walker, surveyor to the council.

Westhoughton U.D.C.—The Sanitary Committee recommend a further instalment of the water-carriage system, at an estimated cost of £2,000.

WATER, GAS, AND ELECTRICITY.

Aberdeen T.C.—The Lighting Committee recommend the provision of between fifty and sixty new street lamps.

Belper R.D.C.—The surveyor, Mr. Robert C. Cordon, has reported on the scheme for supplying the village of Allestree with water, and the matter has been referred to a committee.

Birmingham T.C.—The council on Tuesday adopted a report by the Water Committee, which recommended the council to proceed at once with the provision of a third pipe on the syphon sections of the aqueduct from the Elan Valley to Frankley, and that the committee should be instructed to submit designs and an estimate for the work. The council also approved designs and estimates for a balancing reservoir at Highter's Heath, Yardley Wood, and authorised the Water Committee to advertise for tenders, and to proceed with the work.

Bridgwater R.D.C.—A tender of £604 has been accepted in connection with the Othery water supply scheme.

Frome U.D.C.—The council have approved the plan of the surveyor, Mr. F. W. Jones, for laying out the proposed new suction-gas plant at the pumping

station, and have directed the surveyor to obtain tenders for the new offices. The estimated cost of the power is £1,100, and it is hoped to save from £350 to £400 a year by the installation.

Kidderminster R.D.C.—The surveyor, Mr. G. J. Shepherd, has received instructions to prepare plans and estimates for a water supply for the parish of Chaddesley. The council have also decided to forward to the Local Government Board the plans for the water supply of Wribbenhall for their approval.

Lurgan U.D.C.—Arrangements have been completed for the purchase of the local gas company's undertaking for £40,000.

Poole T.C.—Extensions to the waterworks, estimated to cost £28,840, are recommended in a report by Mr. A. P. L. Cottrell, of Westminster.

Renfrew C.C.—The construction of the Bennan Loch waterworks for the supply of Eastwood and Mearns has been completed at a cost of over £20,000.

Taunton T.C.—The accounts of the electricity undertaking for the past year show a nett balance of £178, and from the profits of the water undertaking £500 has been paid over to the rates.

Walsall T.C.—It was reported on Monday that the sanction of the Board of Trade had been received to the erection of the new electricity works on the site proposed by the town council. In presenting a report from the Gas Committee, Mr. Venables mentioned that it was proposed to expend £10,000 upon various improvements.

MISCELLANEOUS.

Cardiff T.C.—The council on Monday adopted a proposition approving of a crematorium in principle, and asking the Parks Committee to report on the subject.—The Public Works Committee submitted a recommendation that the city engineer, Mr. W. Harpur, be allowed to hire a motor car when necessary, whereupon Sir John Courtis moved the reference back of the minute with a recommendation that the committee should consider the advisability of buying a car for the use of the city engineer. Sir John said that when he was in Canada he found that all the chief city officials were provided with motor cars. The time had come long ago when the city engineer of Cardiff and the electrical engineer should be provided with a motor car each, to facilitate the discharge of their duties. Councillor A. J. Howell seconded, and said it was time that the departments of the city were run on business lines. Alderman W. Roberts, chairman of the Public Works Committee, explained that the recommendation was intended to be an experiment for a year to ascertain the relative cost of buying or hiring a car, and Sir John Courtis withdrew the amendment.

Swansea T.C.—The General Purposes Committee, in response to an application from the promoters of the Gower Light Railway for a contribution towards the cost of the construction of the line, recommend the corporation, subject to certain conditions, to contribute a sum of £5,000. The Gower Council has already made a similar contribution, and in the event of that of Swansea being confirmed by the council, the Treasury has power to make a contribution of an equal amount to those made by public authorities—or, in this case, £10,000.

Town Planners at Birmingham.—The members of the International Garden Cities and Town Planning Association, who are on a tour of an educational character, arrived in Birmingham yesterday, and were welcomed by the Lord Mayor (Lieut.-Colonel Martineau) at the Council House. The company included representatives of France, Germany, Holland, Italy, Poland, Russia, Spain, Canada, Australia, India, and America. In the course of the proceedings a paper on the progress of town planning in Great Britain was read by Mr. Henry R. Aldridge, secretary of the National Housing and Town Planning Council. Mr. Aldridge suggested that the standard of a normal, healthy home for a workman's family should be three bedrooms, a large living room, a scullery, and a bath, and, wherever possible, a parlour. Many thousands of English artisans already enjoyed homes of this standard, and, given adequate public attention to the housing question, we were within measurable distance of securing it as the normal type of a workman's home in industrial England.

PERSONAL.

Mr. S. A. Hill-Willis, surveyor to the Tilbury Urban District Council, has received an increase of salary.

Mr. T. W. Plews, surveyor to the Startforth Rural District Council, has had his salary increased by £20 per annum.

Mr. O. M. Prouse, surveyor to the Ilfracombe Urban District Council, has been voted an increase of salary of £20 per annum.

Mr. G. W. Lacey, borough surveyor of Oswestry, has received an increase in his salary of £50 per annum, making it £300.

Mr. R. M. Stone, assistant county surveyor of Somerset, has been appointed county surveyor for the Northern Division of Devon.

Mr. A. E. Smith, surveyor to the Hay Urban District Council, has been appointed surveyor and inspector to the Petersfield Urban District Council.

Mr. Henry Gregson, surveyor to the St. Annes-on-Sea Urban District Council, who has resigned, has been retained as consulting surveyor, at a salary of £100 per annum.

Mr. G. H. Jack, county surveyor and architect of Herefordshire, has been voted unanimously an increase of salary by the county council. This is the fourth increase he has received during his term of office, extending to seven years.

Mr. C. W. Leney, surveyor and inspector of the East Preston (Sussex) Rural District, has had his salary reconsidered and fixed at a total of £173. The council have also agreed to appoint an assistant surveyor at a salary of £65 a year.

Mr. A. Stanley Northover, assistant to Mr. E. Plummer Davies, engineer and surveyor to the Tisbury Rural District Council, was last week appointed assistant surveyor to the Kidderminster Rural District Council. Mr. Northover served as articled pupil with Mr. Davies.

Mr. Thomas Cole, ASSOC.M.INST.C.E., formerly secretary, and now consulting secretary, to the Institution of Municipal and County Engineers, has entered into private practice as a consulting engineer with the firm of Pollard & Tingle, 31 Old Queen-street, Westminster.

Mr. F. W. Macaulay, at present the Elan water supply resident engineer, was on Tuesday last appointed by the Birmingham Town Council supply engineer, at a salary of £1,200 per annum. The council also authorised the Water Committee to appoint a temporary assistant engineer, at a salary not exceeding £600.

Mr. Francis Wood, M.INST.C.E., F.G.S., whose paper on "The Economies of Modern Methods of Road Construction," read at the annual meeting of the Institution of Municipal and County Engineers at Cheltenham, was reproduced in THE SURVEYOR of last week, is the engineer and surveyor of the Metropolitan Borough of Fulham, and has occupied that position twelve years. He is a native of Liverpool, and was trained at the Walker Engineering Laboratories under Dr. H. S. Hele-Shaw, LL.D., F.R.S., Liverpool University. He has occupied various positions, serving as assistant under the municipalities of Wakefield and Leicester, and as chief at Bacup, Lancs. He is the author of "Practical Sanitary Engineering" and "Modern Road Construction." He has made a special study of the use of bitumen in road construction, and was awarded the Triennial Prize of 750 francs by the International Road Congress, 1913, for the paper that would best promote the construction and maintenance of roads for modern traffic.

City of London Improvement.—At the meeting of the City Corporation last week sums amounting to £37,000 were voted for acquiring interests in property required for the widening of Leadenhall-street. A plan for disposal of the surplus land by public auction or private treaty was also approved.

London Borough Councils and Electricity.—The Metropolitan Borough Councils Standing Joint Committee has resolved to appoint a special committee, to consist of representatives of the London borough councils owning electricity undertakings, to consider the desirability of taking immediate steps to provide a joint supply for the metropolitan area.

£5,000,000 FOR COTTAGES.

A Bill [illegible] the Government proposes to [illegible] millions of money in assisting the development of housing accommodation in the rural areas and an additional two millions for housing the [illegible] engaged on Government works where sufficient dwellings were not available, was introduced [illegible] in the House of Commons by Mr. Runciman, President of the Board of Agriculture. Mr. Runciman said the Government had decided that the [illegible] should be three in a central authority and so far as the agricultural districts were concerned they had decided to entrust it to the Board of Agriculture. The three millions for rural housing would be under the control of the Government Department, and not of private individuals. The Treasury had undertaken to borrow the money by means of terminable annuities for a term not exceeding thirty years. The rents would not provide for the repayment of the money after thirty years, and the Government, while letting the houses on an economical basis, would make the period of repayment more nearly approach the age of the cottages. The sinking fund on the land would not be charged to the occupiers of the cottages. The Bill was read a first time.

In the House of Commons on Monday a question was put as to whether it was proposed under the Bill to provide houses for agricultural labourers in purely rural districts only or in semi-industrial areas also, where they were apt to be crowded out of the available cottages by the higher paid employees of more profitable industries; whether it was proposed to let all Government cottages at a full economic rent representing 5 per cent upon the capital outlay; whether a garden would be provided in every case; and, if so, what would be its minimum area.

Mr. Runciman said the answer to the first part of the question would be found in Clause 1 of the Bill. It was the intention of the Government that all the cottages provided should be let at an economic rent, but he was not prepared to accept absolutely the questioner's definition of that phrase. Gardens would be provided wherever necessary; the size would naturally depend upon various circumstances, and he was not prepared to pledge himself to a minimum.

"Three Towns" Amalgamation.—The Bill to confirm the Local Government Board Provisional Order granted to Plymouth for the amalgamation of the Three Towns (Plymouth, Devonport, and Stonehouse) was approved by the Select Committee of the House of Commons on Wednesday.

FOR OTHER ADVERTISEMENTS

See End of Paper.

WANTED, in North Staffordshire, an expert [illegible] man to manufacture Tarred Slag. Apply Box [illegible], office of THE SURVEYOR, 24 Bride Lane, Fleet Street, E.C. (1,798)

ESSEX COUNTY COUNCIL.

HIGHWAYS COMMITTEE.

ASSISTANT TO THE COUNTY SURVEYOR.

Applications are invited for the appointment of a General Engineering Assistant on the Staff of the County Surveyor. Candidates must have had previous experience in the Office of a County Surveyor and be capable of taking charge of Bridge and Road Construction.

Salary £250 per annum, rising by annual increments of £10 to a maximum of £270. Age not to exceed 40.

The appointment will be subject to three months' notice given or received. No superannuation or pension [illegible] to the appointment.

A medical examination will be a condition precedent to the appointment.

Applications, with not more than three recent testimonials (copies), both as to ability and good character, to be received at the office of the County Surveyor, Chelmsford, not later than Wednesday, August 5th.

PERCY J. SHELDON, M.INST.C.E.,
County Surveyor.

Chelmsford.
July 15, 1914. (1,797)

PEWSEY RURAL DISTRICT COUNCIL.

DISTRICT SURVEYOR.

Applications are invited for the Appointment of District Surveyor.

Salary £90 per annum. The person appointed will be required to devote his whole time to the service of the Council. He will also be required to give a Bond for £200 in an approved Guarantee Office.

Applications, in Candidate's own handwriting, stating age and previous experience, together with copies of three testimonials of recent date, must reach me not later than the 8th August next.

ROBERT DIXON,
Clerk to the Council.

Pewsey.

URBAN DISTRICT COUNCIL OF DENTON.

EXTENSIONS OF SEWAGE DISPOSAL WORKS.

The above Council invite Tenders for the construction of twelve New Circular Percolating Filters, together with Humus Tanks, Automatic Dividing Chambers, and other works in connection therewith.

Plans may be seen, and General Conditions, Specifications and Forms of Tender may be obtained, at the office of Mr. Jno. B. Cooke, Engineer and Surveyor to the Council, Town Hall, Denton, near Manchester, between the hours of 9.30 and 11 in the morning of any week day after Tuesday, the 21st July, 1914, upon payment of three guineas, which sum will be returned on receipt of a *bonâ-fide* Tender.

Tenders, sealed and endorsed "Sewage Works Extensions Contract No. 4," must be sent in to me so as to be received by me not later than Saturday, the 15th August, 1914.

The Council do not bind themselves to accept the lowest or any Tender.

WM. RICHARDS,
Clerk to the Council.

Town Hall, Denton,
Near Manchester.
July 15, 1914. (1,799)

BOROUGH OF MARLBOROUGH.

CAST-IRON PIPE SEWER.

The Corporation invite Tenders for the laying of about 276 yds. of 6-in. Cast-iron Pipe Sewer in the College Grounds.

Plans may be seen, and Specifications, Quantities and Form of Tender obtained, at the office of the Borough Surveyor, Mr. G. Parker Pearson, Assoc.M.Inst.C.E., Marlborough, on the deposit of half-a-guinea, which sum will be returned on the receipt of a *bonâ-fide* Tender.

Sealed Tenders, endorsed "Sewer," to be delivered at my office not later than 10 a.m. on Wednesday, the 29th inst.

The Corporation do not bind themselves to accept the lowest or any Tender.

E. LLEWELLYN GWILLIM,
Town Clerk.

Marlborough.
July 15, 1914. (1,796)

BECKENHAM URBAN DISTRICT COUNCIL.

TO TAR-MACADAM CONTRACTORS.

The Beckenham Urban District Council invite Tenders for the Supply and Delivery to Bromley South Railway Station (L.C. & D.Rly.) of 150 tons of 1½-in. Tarred Slag.

Specifications and Forms of Tender obtained on application to Mr. John A. Angell, Surveyor, on and after 18th July, 1914, on the production of a receipt from the Collector for a deposit of £1, which will be returned on the receipt of a *bonâ-fide* Tender.

A clause will be inserted in the Contract providing that the Contractor shall pay to the employees the wages generally accepted as current for workmen engaged on similar work in the Town where the work is executed.

Tenders, duly sealed and endorsed "Tenders for Tarred Slag," to reach undersigned not later than 4 p.m., Monday, July 27, 1914.

The Council do not bind themselves to accept the lowest or any Tender.

(By order)
F. STEVENS,
(1,795) Clerk of the Council.

REINFORCED CONCRETE ROAD FOUNDATIONS.

establish the finished road surface. If, for instance, wood blocks are to be used instead of a shallow type of concrete strength crust rather than to carry out a general excavation to a greater depth. In all these cases the use of a reinforced-concrete strength crust may be considered as an alternative to other methods of obtaining a crust of sufficient strength. The proper

position of the reinforc[illegible] number of considerations and can only be determined [illegible] applied mechanics. [illegible]y, however, there are [illegible] in which the position of the reinforcement [illegible] available.

To meet these cases [illegible] being in the running in competing methods in a far larger [illegible]ons, the British Reinforced [illegible] applied in a number [illegible] set fairly close together [illegible] red length, and they can therefore be put [illegible] the minimum of obstruction to traffic and [illegible] per square yard when the strongest meshes are required, and it is supplied in a considerable range of strengths. A rough test calculation, assuming that the strength crust had to bridge a weak spot, showed that a reinforcement in one of the middle strengths of the series would give to a 9-in. concrete crust an [illegible] reinforced crust would serve a purpose which could not be served by a plain concrete crust however great its thickness.

[illegible] the relatively light bars which are used in this reinforcement may easily be cut through by chisels at the same time as the concrete. The cutting of these bars, breaking their continuity, would, of course, make it somewhat more difficult to make good after trenching than it is in the case of plain concrete; but this would not necessarily cost more than making good with plain concrete, and could usually be made more effective. For really permanent strength crusts which need hardly ever be disturbed, the reinforced concrete has a decided advantage over plain concrete which, especially under the conditions of rural roads, has a much greater tendency to crack with the lapse of time. In some cases, where the natural foundation [illegible] for the wearing crust to rest upon, [illegible] to crack. In this direction the use of a light reinforcement in a thin concrete crust is worth consideration, and may, perhaps, be considered promising of development.

In a pamphlet which they issue the British Rein[illegible] which, though sanguine, are by no means extravagant, with respect to the merits of reinforced-concrete strength crusts for roads, and if to the useful simplicity of their main idea this firm add the subtleties of design necessary to meet specific difficulties, they should obtain a fair share of the work of road construction in the near future.

The Civil Engineer's Work Why, [illegible] by the [illegible] AND COUNTY [illegible] remarkably [illegible] is full and methodically arranged. The book is published by the St. Bride's Press, Limited.—*Liverpool Courier.*

Metropolitan Water Board's New Offices. At a [illegible] Water Board approved of the estimate of £100,000 in respect of the [illegible] head in Rosebery-avenue, and appointed Mr. H. Austen Hall (author of the selected design) architect, to carry out the work. The General Purposes Committee were instructed to obtain and submit tenders for the erection of the building.

Japanese Street Pavings.—An American consular report states that modern street pavements are as yet practically unknown throughout Japan. Outside of the business districts of the more important cities [illegible] of footpaths for pedestrians. As a rule these streets, when paved at all, are macadamised as cheaply as possible, and their condition in the congested traffic districts is generally very unsatisfactory. It is stated that in the city of Tokio, which has a population of about 2,000,000 persons, there is but one steam roller used in this work. A few experiments in street paving were recently conducted in Tokio under the direction of the city authorities, but with poor results. In these experiments wood blocks coated with a thin covering of asphalt were used, and the streets paved with this material are already showing signs of wear.

SOME RECENT PUBLICATIONS.*

[illegible] Hall.

[illegible] neering literature is so well understood, that little [illegible] tion than an indication of the nature and extent of the new matter. But for the convenience of engi[illegible] and [illegible] [illegible] [illegible]

MOTOR OMNIBUS TRAFFIC.

LORDS' COMMITTEE AND MIDDLESEX BILL.

On Friday last a Select Committee of the House of Lords passed the Middlesex County Council's Bill to authorise the construction of a road 3 miles long and 80 ft. wide from Chiswick to a point on the Great West road at Hounslow, giving a new route from the West of England, and relieving the congestion of Brentford High-street.

As is well known, a clause of the Bill enables the county council to charge the omnibus companies three-eighths of a penny per car-mile towards the expenses of maintaining the road, but it was reported on Monday that the decision of the Committee will not be accepted as final by the companies and that an attempt will be made to have the Bill recommitted.

Among those who gave evidence were the city surveyor of Westminster, Mr. J. W. Bradley, and the borough engineers of Marylebone (Mr. J. P. Waddington) and Fulham (Mr. F. Wood), who expressed the view that motor omnibus traffic did no special damage to well-constructed highways. It was also asserted that if a charge of anything like three-eighths of a penny per car-mile were levied upon the motor omnibus services throughout London the companies' profits would be eaten up and the whole of the services would be stopped.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. J. S. PICKERING, M.INST.C.E., Borough Surveyor and Water Engineer, Cheltenham.

MEETING AT HACKNEY.

A meeting of the institution is to be held in the Metropolitan District at the Town Hall, Hackney, to-morrow (Saturday), the 18th inst.

PROGRAMME.

2.15 p.m.—By kind permission of the chairman and members of the Town Hall Committee, members will assemble in the council chamber and will be welcomed by the Mayor of Hackney, Councillor Chas. Winkley, J.P.

Discussion on paper, "Notes on the Refuse Destructor Works and Electricity Undertaking of the Borough of Hackney," by Mr. L. L. Robinson, M.INST.C.E., M.INST.E.E., borough electrical engineer.

2.30 p.m.—Special meeting. Confirmation of Articles of Association and by-laws.

Discussion resumed.

3 p.m.—Leave town hall in motor conveyances (fare 2s. 6d.) to visit refuse destructor and electricity works, the latter including extension of buildings, boiler-house, coal bunkers, transporter, &c. Mr. Robinson has kindly consented to be present and accompany the members through the works, pumping station, filter-beds, &c., of the Metropolitan Water Board at Lea Bridge, thence to King Edward VII. reservoir, Chingford, to inspect the Humphrey pumps, &c., by the kind permission of Mr. Wm. Booth Bryan, M.INST.C.E., member of the institution, chief engineer of the Metropolitan Water Board, who will be present and accompany the members.

Return to town hall for tea, by invitation of the hon. secretary, Metropolitan District.

NORMAN SCORGIE, M.INST.C.E.,
Hon. District Secretary.

Hackney.

EASTERN DISTRICT MEETING AT TILBURY.

An Eastern District meeting will be held at Tilbury on July 25th.

PROGRAMME.

10.15 a.m.—Members will assemble at Tilbury Dock Railway Station, where they will be received by the chairman of the urban district council (Mr. Alexander Brennan, J.P.).

10.20 a.m.—Inspect underground convenience, Broadway (opposite railway station), section of Tarmac, &c.

10.30 a.m.—Enter premises of Tilbury Dock, by kind permission of Mr. C. R. S. Kirkpatrick, M.INST.C.E., and pass through existing docks to the works for Tilbury Dock extension (Messrs. Topham, Jones and Railton's contract, in parts by Walter Scott & Middleton, contractors). Inspect these works being: (*a*) The block-making yard, and ballast washing and screening plant; (*b*) general excavation in progress between dock and river; (*c*) concrete mixing plant in progress; (*d*) construction of new shed No. 1 and railways in progress. Driving of "Simplex" piles for foundation of sheds Nos. 2 and 3.

12.15 p.m.—Members will proceed to the works of construction of new river jetty (Messrs. Perry & Co.'s (Bow), Limited, contract). Inspect cylinder sinking, pile driving, and reinforced concrete construction.

12.35 p.m.—Members will proceed across main entrance lock and two dry docks, and by way of quay on east side of basin to Tilbury Hotel.

1 p.m.—Members will partake of luncheon at the Tilbury Hotel.

2 p.m.—Discussion on paper, by Mr. S. A. Hill-Willis, on "Tilbury and Some Particulars of a New Sewerage Scheme in the Adjoining Rural District."

2.45 p.m.—Members will proceed by motor conveyances to the World's End and through the adjoining rural district to Stanford-le-Hope: (*a*) To inspect river frontage purchased by Midland Railway Company; (*b*) to proceed to and inspect Tilbury Fort gateway and septic tank installation.

3.30 p.m.—Arrive Stanford-le-Hope sewage disposal works.

4.15 p.m.—Members will return from Stanford-le-Hope *viâ* Tilbury North Ward, passing *en route*: (*a*) Site for housing North Ward; (*b*) site for housing South Ward; (*c*) private streets improvements works (in progress); (*d*) Tilbury mortuary and post-mortem room.

4.45 p.m.—Tea at the Tilbury Hotel at the invitation of Mr. S. A. Hill-Willis, followed, if desired, by further discussion on paper.

J. A. WEBB,
Hon. District Secretary.

Great Stanmore.

CLEETHORPES MEETING.

A meeting of the institution will be held at Cleethorpes on September 19th.

SCARBOROUGH MEETING.

A meeting of the institution in the North-Eastern District will take place on Saturday, September 26th, at Scarborough.

EAST MIDLAND DISTRICT.

It is hoped that a District meeting will be held in South Leicestershire in the near future.

J. W. DUDLEY ROBINSON, B.SC.(LOND.),
Secretary.

92 Victoria-street,
Westminster, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. HORACE BOOT, M.I.E.E., M.I.MECH.E.

EASTERN AND NORTH-EASTERN DISTRICT.

A visit will be paid to Hunstanton on August 14th, 16th and 17th.

There will be no business or other meetings, and ladies and friends of members (including family parties) are specially invited. It will form purely a trip to the seaside, with the opportunity for members to meet on a purely friendly footing.

Arrangements will be made for luncheon (at 1.30) and tea (at 5.30) at the Railway Hotel on the Saturday, and it is hoped that all attending will meet at those times. (Approximate cost for luncheon and tea, 2s. 9d. per head.)

Those who desire may make the one-day trip only, but those seeking accommodation for an extended period (two or three days or more) are advised to notify me at the earliest possible date, not later anyway than July 24th. Full particulars of Hunstanton, with a list of hotels and boarding-houses,

Yorkshire, will be held at Harrogate on Saturday, September 12th.

39 Victoria-street, S.W. *Secretary*

APPOINTMENTS VACANT.

OLDHAM. [illegible] Borough Surveyor.

RICHMOND. [illegible] July 23rd. [illegible] North-road, for the corporation.—Mr. J. H. Brierley, borough surveyor.

STOCKPORT. [illegible] July 24th.—For making up certain roads, for the corporation.—Mr. J. Atkinson, borough surveyor.

GREENOCK.—July 25th.—For paving with granite [illegible] Master of Works.

BRAINTREE.—July 27th.—For the supply of 700 [illegible] Mr. H. H. Nevill [illegible]

WINCHESTER. July 27th. For repairing and adamising work, for the corporation.—Borough Engineer.

WIGAN. July 27th. For paving portions of Chapel-lane and Poolstock with granite setts, for the corporation.—Mr. A. T. Gooseman, borough engineer, King-street.

WATFORD.—July 28th.—For making up certain roads, for the urban district council.—Mr. D. Waterhouse, engineer.

WOODFORD.—July 28th.—For the supply of broken granite and hire of steam rollers and scarifiers, for the urban district council.—Mr. W. Farrington, surveyor.

BIRMINGHAM. July 28th. For paving at High street, Harborne (creosoted deal), Ryland-street, Ledsam-street, and Booth-street (granite setts and creosoted deal), and concrete foundations for Durax paving in Harborne-road, for the corporation.—Mr. Henry E. Stilgoe, city engineer and surveyor.

EDMONTON.—July 28th.—For providing and laying creosoted deal blocks, for the urban district council. —Mr. C. Brown, engineer.

COLCHESTER.—July 29th.—For laying about 10,000 sq. yds. of wood-block paving, partly on cement concrete foundations, including the removal of existing granite sett paving and macadam, for the corporation.—Mr. Harold Collins, borough engineer and surveyor.

LLANTRISANT. July 29th. For making up certain streets, for the rural district council.—Mr. T. Saunders, surveyor, School-street, Pontyclun, Glam.

PERTHSHIRE.—July 31st.—For the reconstruction of 25 miles of road through Glen Dochart, Glen Falloch and Strath Fillan, in the parish of Killin, for the Western District Committee.—Mr. W. L. Gibson, engineer and surveyor, Post Office Buildings, Dunblane, Perthshire.

BLACKROCK.—August 1st.—For the construction of a road, for the urban district council.—The Clerk.

HASTINGS.—August 3rd.—For the supply of 2,000 tons of broken granite, for the corporation. —Mr. P. H. Palmer, borough engineer.

ALFRETON.—August 10th.—Offers for a steam roller built by Messrs. Aveling & Porter in 1893.—Mr. R. F. Wood, surveyor.

Sanitary.

ROMFORD.—July 18th.—For the construction of stoneware pipe sewers, and road work, for the rural district council.—Mr. W. J. Grant, surveyor, 16A South-street, Romford.

TILBURY.—July 18th.—For the removal of house refuse, for the urban district council.—Mr. T. A. Capron, clerk.

ROTHERHAM.—July 20th. For laying stoneware pipe sewer, for the rural district council.—Mr. B. Hey, engineer, Imperial Buildings.

BRADFORD.—July 20th. For the construction of a circular outfall sewer in tunnel, for the corporation.—Mr. J. Watson, Town Hall.

FAREHAM.—July 20th.—For the provision and laying of about 465 yds. of 12-in. sea outfall pipe, about 87 yds. of 3-in. pipe, concrete cradle blocks, concrete piling and driving, laying about 8,000 yds. of 12-in., 9-in., and smaller stoneware pipe sewers, about 900 yds. of 12-in., 7-in. and 6-in. cast-iron pipe sewers, construction of manholes, ventilation and flushing chambers, storage tank, and other works, for the rural district council.—Mr. W. Cobbett, engineer, West-street, Fareham, Hants.

HALTWHISTLE.—July 20th.—For the construction of sewage disposal works, for the rural district council.—Mr. J. F. Parker, engineer, Post Office Chambers, Newcastle-on-Tyne.

DONCASTER.—July 21st.—For scavenging work, for the rural district council.—Mr. G. W. Cowley, sanitary inspector, 7 St. George-gate, Doncaster.

MACCLESFIELD.—July 21st.—For work of sewerage, for the corporation.—Mr. S. C. Baggott, borough surveyor.

SEDGEFIELD.—July 22nd.—For the removal of house refuse, for the rural district council.—Mr. J. W. [illegible] inspector, Blackgate, Coxhoe.

DENTON.—July 22nd.—For the construction of about 1,000 yds. of 12-in. stoneware pipe sewer, partly in tunnel, and other works connected therewith, for the urban district council.—The Surveyor, Town Hall, Denton.

HORSFORTH.—July 25th.—For sewage works extension, for the urban district council. — Mr. H. Raven, engineer.

SOUTHGATE.—July 28th.—For laying surface-water sewers, for the urban district council.—Mr. C. G. Lawson, surveyor.

CANNOCK.—July 29th.—For the supply, delivery, and placing in filters of about 3,400 cub. yds. of cold-blast furnace slag, and 1,845 cub. yds. of granite filling, washed and screened to the required size at the sewage farm, for the urban district council.—Mr. Robert Blanchard, engineer and surveyor, Council Offices.

AXMINSTER.—July 29th.—For the construction of sewage disposal works, for the rural district council.—Messrs. Phillott & George, engineers, 31 Promenade, Cheltenham.

PORTHCAWL.—July 31st.—For the construction of certain lengths of stoneware and iron sewers of 9, 12, and 21 in. diameter, and concrete tube sewers of 30 in. in diameter, manholes, flushing tanks, and sea outfall, for the urban district council.—Messrs. J. Taylor & Sons, Caxton House, Westminster, S.W.

CHIPPING NORTON.—July 31st.—For the provision and laying of about 3,600 yds. of earthenware pipe sewers, manholes, and ventilating columns, also extension to existing outfall works, construction of percolating filters, separating tanks, humus tanks, and other appurtenant works, for the corporation.—Messrs. Berrington, Son & Watney, Prudential Chambers, Lichfield-street, Wolverhampton, and 28 Victoria-street, Westminster, S.W.

BARRY. July 31st. For sewage disposal works extension, for the urban district council.—Mr. J. E. Aldersley, engineer and surveyor.

PORTSLADE.—August 4th.—For the construction of main surface-water sewer and outfall works, for the urban district council.—Messrs. Chatterton & Alford, 9 Victoria-street, Westminster, S.W.

RUNCORN. August 7th. For the construction of sewers and sewage disposal works, for the rural district council.—Messrs. J. Diggle & Son, 14 Victoria-street, Westminster, S.W., and Hind Hill-street, Heywood, Lancashire.

RUNCORN. August 7th.—For laying steel tube, cast-iron and earthenware pipe sewers, flushing tanks, storm overflows, manholes, ventilators, sedimentation tanks, percolating filter (including reinforced concrete construction on the Kahn system), engine and pump-house, pump well, and other appurtenant works, for the rural district council. Messrs. J. Diggle & Son, 14 Victoria-street, Westminster, S.W., and Hind Hill-street, Heywood, Lancashire.

FLEET.—August 13th.—For the construction of about 16 miles of stoneware and cast-iron sewers, brick, concrete, and cast-iron manholes, flushing tanks, ventilating shafts and columns, cast-iron rising mains, air mains, engines, compressors, ejectors, and other works incidental thereto, for the urban district council.—Mr. T. J. Moss-Flower, engineer, 28 Victoria-street, Westminster, S.W.

ALEXANDRIA.—December 8th.—For the construction of a sewerage system, for the municipality.—"M. le Président de la Commission Municipale d'Alexandrie," Alexandria.

Miscellaneous.

HOWDEN. July 24th. For the construction of a 12-in. trial boring in the parish of South Newbold, and for testing the yield of water therefrom, for the rural district council.—Mr. Percy Griffith, 20 Victoria-street, Westminster, S.W.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

JULY.

18.—Junior Institution of Engineers: Visit to Tunnel Portland Cement Works, Purfleet.
18.—Somerset Surveyors' Association: Meeting at Williton, 2 p.m.
18.—Institution of Municipal and County Engineers: Meeting at Hackney.
18.—Institution of Municipal Engineers: Northern District Meeting at Alnwick.
25.—Institution of Municipal and County Engineers: Eastern District Meeting at Tilbury.

AUGUST.

15-17.—Institution of Municipal Engineers: Visit to Hunstanton.

SEPTEMBER.

19.—Institution of Municipal and County Engineers: Meeting at Cleethorpes.
26.—Institution of Municipal and County Engineers: Meeting at Scarborough.

APPOINTMENTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

COUNTY BOROUGH OF ROTHERHAM.
BOROUGH AND WATERWORKS ENGINEER'S DEPARTMENT.

The Rotherham Corporation invite applications for the position of Assistant to the Waterworks Engineer.

Salary £120, rising by £5 per year to £140.

Applications, on Forms to be supplied, and accompanied by copies of three recent testimonials, must be received by the undersigned not later than July 28th, 1914.

Canvassing, directly or indirectly, will be deemed a disqualification.

CHAS. L. DES FORGES,
Town Clerk.

Town Hall, Rotherham.
July 13, 1914. (1,790)

BOROUGH OF CHEPPING WYCOMBE.

The Town Council invite applications for the appointment of Clerk in the Borough Surveyor's Department.

Candidates must be shorthand writers and typists, and have a good knowledge of accounts as kept in a Municipal Surveyor's Office. Salary £78 per annum.

Applications, stating age and qualifications, with not more than three recent testimonials, endorsed "Surveyor's Clerk," must be delivered to the undersigned not later than noon on Wednesday, the 22nd July, 1914.

Canvassing will be considered a disqualification.

T. J. RUSHBROOKE,
Borough Engineer and Surveyor.

25 Easton-street,
High Wycombe.
July 6, 1914. (1,774)

COUNTY BOROUGH OF SWANSEA.
APPOINTMENT OF BOROUGH ESTATE AGENT AND VALUER.

The Corporation of Swansea invite applications for the appointment of Borough Estate Agent and Valuer.

Salary £400 per annum, payable monthly.

Applications, stating age, qualifications, and experience, accompanied by copies of not more than three recent testimonials (which will not be returned), endorsed "Estate Agent," to be sent to me the undersigned (from whom particulars of the duties of the office can be obtained) not later than 12 o'clock noon on Tuesday, the 21st July, 1914.

Canvassing, either directly or indirectly, will be a disqualification.

H. LANG COATH.
Town Clerk.

nd printed copies of their applications and testimonials to the members of the Highways Committee, a list of whom can be obtained on application.

The person appointed will be required to devote the whole of his time to the duties of his office.

Applications must be sent in to the undersigned not later than the 31st instant.

Further particulars of the terms of the appointment can be obtained from the undersigned.

CHRISTOPHER L. COWLARD,
Clerk of the County Council.

Bodmin.
July 3, 1914. (1,765)

BOROUGH OF WORKINGTON.

The Corporation of Workington require the services of an experienced Road Foreman, and are prepared to receive applications from persons whose age must not exceed 45, and who must have a thorough experience in modern road construction and maintenance, including tar and bituminous bound roads, sewer construction, and all other duties which generally appertain to the office.

He must also be thoroughly experienced in the supervising and organisation of manual and team labour.

Preference will be given to candidates who have held a similar position under a Local Authority, and who are also able to cycle.

The salary will be £2 5s. per week.

Applications, in candidate's own handwriting, stating age, experience, present and previous appointments, accompanied by three recent testimonials, to be sent to the undersigned, endorsed "Road Foreman," by Tuesday, the 21st instant.

Canvassing will disqualify any candidate.

H. BOWMAN WILLIAMS,
Borough Engineer and Surveyor.

Town Hall, Workington.

Minutes of Proceedings.

Road Tolls, Road Taxes, and Heavy Motor Vehicles.

A very critical period has been reached in the development of the highway system and of road locomotion in this country. On the one hand there is the acceptance by a Parliamentary Committee of the principle of the toll-gate on single lengths of road forming parts of the highway system of the country; and on the other hand there is the announcement, reported on another page, that a Select Committee is to be appointed "to consider the whole position with regard to motor omnibuses and trolly vehicles running in the neighbourhood of great corporations." Should these services pay for the upkeep of the roads, and if so, how much? That is the question to be considered, involving, it may be pointed out, the further questions What is the "neighbourhood," and what is a "great corporation"? Now, in actual fact, motor omnibuses, motor coaches, and other heavy public service and touring vehicles inflict more wear and tear upon the roads in places remote from great corporations than they do in and near the towns, and it seems therefore that it would be much better to consider the contributions of these services as a part of a general system of vehicle taxation. We already have the simple and convenient petrol tax, and, if more money is needed, a general and graduated wheel tax, or axle-weight tax, could be imposed, and could be collected much more easily and cheaply than a tax based upon the demarcation of areas which are in many cases rapidly changing in character. Considering, moreover, that tramways and wire-bus systems involve an interference with the highway and a fixity of route, neither of which exists in the case of free vehicles, it seems only reasonable that the latter class should be treated on its merits, and as though the fixed route systems did not exist. Surely, it is worth while to preserve the truly highway character of our road system by imposing whatever taxes may be necessary upon the vehicles or their mileages, without reference to areas or routes. That London motor omnibuses should pay, say, ¾d. per mile while running on the Great West Road, and nothing per mile in London itself, nor in the open country to the west of this road, seems, on the face of it, to be an illogical and inconvenient arrangement. It is likely, too, to lead to the making of attempts to utilise other roads which will be less fit to stand such traffic, and in the end the country will be forced to regard the vehicle itself or its mileage, or both, as providing the only possible basis for taxation. The payment by the Imperial Government of half the cost of great main roads, and a quarter the cost of another class of roads, will wipe out at one stroke the case for taxation to meet heavy local wear and tear caused by public service vehicles. Tolls and local omnibus taxes would be very unpopular, for it is obvious that a 2-ton limousine motor car conveying one rich banker to and fro between the City and his country house in Surrey or Hertfordshire would wear the roads to a much greater extent per passenger than would the ordinary public service vehicle in the suburbs.

It may be pointed out that on Monday last the House of Lords passed the third reading of the Middlesex Bill; but the Paymaster-General, in suggesting that the matter of the toll should be "hung up until the question could be considered as a whole," seems to have implied that the toll on this road could not be regarded as permanently fixed unless it should turn out to be in accord with arrangements made on a wider basis and [illegible] generally. As regards the Great West Road project, we may refer our readers to THE SURVEYOR of May 15th, pp. 793-794, noting that the estimate of Imperial contributions should have been stated as about £2,500,000, not £4,500,000. The considerations set forth in these pages seem to point to the conclusion that the toll-gate system should not be revived on English highways, and we believe that the objections to direct local taxes are quite as strong, especially in view of the fact that indirect taxation may be quite as effective [illegible]

Sewage Purification by Aëration: Manchester Experiments.

So much interest has been [illegible] by various statements that have been made from time to time with regard to the possibilities of purifying sewage by aëration, that we much regret that we are unable to print the whole of the paper upon "Experiments on the Oxidation of Sewage Without the Aid of Filters," which was read by Messrs. Edward Ardern M.Sc., and William T. Lockett, M.Sc., in April last at a meeting of the Manchester Section of the Society of Chemical Industry. On another page we reproduce the conclusions arrived at as a result of the investigations made; the full text of the paper, with tables, appeared in the Journal of the society for May 30th, a copy of a reprint of which has just come to hand. In previous references to similar

experiments so have extended these investigations into the possibilities of future developments in sewage purification in what appears to us to be the right direction, especially as the results, so far, indicate a great advance in the solution of the problem of sludge disposal. At the same time, we have pointed out that the next step is to ascertain the cost of the process when carried out on a large scale under ordinary working conditions. It was quite natural that the authors of the paper in question, which dealt with laboratory experiments, should hesitate to give any definite figures as to the probable cost of the system on a large scale; but in the course of the discussion there were brought forward some particulars which may be interesting to those who have been watching the experiments with interest.

In the first place, it would appear that satisfactory results have been obtained with six hours' aëration, and allowing a similar period for manipulation, it would appear to be possible to use a set of tanks twice in each twenty-four hours, which means that the capacity of the necessary tanks for dealing with the dry-weather flow should be equal to one-half the daily dry-weather volume. If allowance is made for dealing with three times the dry-weather flow as sewage proper, then the total tank capacity needed would be one and a-half times the dry-weather flow. Special arrangements will, of course, be required to ensure the thorough mixing of the air with the sewage in such large tanks, and some special means will have to be devised for aërating the sludge and keeping the "activated sludge" in intimate contact with the sewage as appears to be necessary. Then, with regard to the volume of air required, it was stated by Mr. Ardern in his reply to the discussion that in the case of the experiments they used about one-fifth of a cubic foot of air per square foot of tank area per minute; but that in practice very much less than this would suffice. If we take 50 per cent of the above-mentioned quantity, and assume the depth of sewage in the tank to be 6 ft., we find that each 1,000 gallons of sewage would require 2·7 cub. ft. of air per minute, or 972 cub. ft. for the six hours during which aëration is taking place. If we have understood the figures aright and our calculations are correct, each 1,000 gallons of sewage would require about 1,000 cub. ft. of air, delivered at the rate of 2·7 cub. ft. per minute. If we now apply these figures to a concrete case with a daily flow of 1,000,000 gallons, we find that 1,000,000 cub. ft. of air would be required in twelve hours, so that the necessary air-compressing plant would have to be capable of delivering 14,000 cub. ft. of air per minute. No information was given as to the pressure under which the air should be delivered, so that we are unable to estimate the horse power required, and although the pressure will probably not be great, the delivery of such a comparatively large volume of air will necessitate the use of air-compressors of considerable size.

These observations are not made in any captious spirit, but simply to indicate, from the information at present available, the chief points which must be considered in any further investigations which may be made on a practical scale. Nothing but praise is due to Messrs. Ardern and Lockett for the admirable manner in which their laboratory experiments have been arranged and carried out, and for the extremely interesting paper in which the results of their work have been made public.

* * *

Organisation.

The recognition of the great importance of scientific organisation is a very striking feature in the modern business world, and inasmuch as the chief spending department of a local authority must be run on business lines if the interests of the ratepayers are to be properly guarded, it will be seen that the power to organise is an essential qualification for the municipal engineer. There can be little wonder, therefore, that the paper on "The Organisation of a Municipal Engineer's Department," which was read at Cheltenham by Mr. Edward Willis, the engineer and surveyor to the Chiswick Urban District Council, was received with special interest. At the outset Mr. Willis very aptly defined good organisation as the efficient and harmonious working of each section of every department, with no friction or wasted time where two sections overlap or become interwoven. Considerations of space preclude us from dealing in any detail with each of the eleven sub-departments which were suggested. The paper, which we reproduce practically in full elsewhere, was of so thorough and practical a character, however, that we advise our readers carefully to peruse it. Due stress was, of course, laid upon the necessity for *esprit de corps*, in order to insure that perfect harmony in working from which alone the most beneficial results can be obtained, but Mr. Willis recommended in addition that every assistant should continue his studies, and always strive to learn and know more than is necessary to enable him merely to carry out his immediate duties. This is a very sound principle, and one which should be carefully noted by every young assistant who desires to rise in his profession. The discussion which followed upon the reading of the paper partly turned upon the responsibility of a chief for the welfare of his staff, one member remarking that every surveyor "ought to assist his assistants." The principle is a right one, and is, we believe, generally acted upon. The knowledge on the part of an assistant that he has the sympathy of his chief is the greatest possible incentive to loyalty and hard work. Another point of discussion, raised by Mr. J. S. Brodie, was as to whether certain of the sub-departments with which the paper dealt were properly included in the scope of the legitimate duties of a municipal engineer. The departments specially mentioned were refuse collection and disposal, sanitary administration, fire protection, and stores and depots. Mr. Brodie's criticism, however, did not receive any general endorsement, and at the most merely amounted to a suggestion that the author of the paper had erred on the side of thoroughness.

* * *

The Euston-road Building Line Appeal.

Questions of more or less difficulty have from time to time arisen in connection with the subject of the building line in London streets. Sec. 75 of the old Metropolis Management Act of 1862 prohibited the erection of buildings beyond the general line of buildings—if the distance of that line did not exceed 50 ft. from the highway—without the consent of the Metropolitan Board of Works. The London Building Act, 1894, repealed this section, but re-enacted it with the substitution of the consent of the London County Council for that of the defunct board, and with the important addition that the general line of buildings should, if required, be defined by the superintending architect, by a certificate to be issued within a month after the application therefor. It is to be observed that this provision does not empower the architect to prescribe the general line, but only to define it. The line exists independently of his certificate, and the latter is only evidence of where the line is. Moreover it has been held that in determining the general line the architect ought to have regard to the frontage of houses previously existing, and

which may be rebuilt, as well as to those still standing, also that he should determine the extent of the space above which the line is to be laid down. An appeal from the architect's decision lies to the Tribunal of Appeal constituted by the Act, and a further appeal lies from that Tribunal to the High Court on questions of law.

The recent case of *Clark and Others v. London County Council* was concerned with the building line of a certain section of the north side of the Eastern road, and presented some peculiar features. This road, it appears, was laid out in the year 1756 under an Act which provided that no building should be erected on new foundations within 50 ft. of the highway. The original buildings were accordingly set back to the 50-ft. line, with forecourts. But subsequently, and prior to the passing of the Act of 1862, another row of houses of varying heights was erected on some of the forecourts on new foundations, 11 ft. only from the kerb, in contravention of the earlier Act. In 1867 the owners of these then unlawful buildings memorialised the Board of Works with a view to legalising the 11-ft. line, and the board, on the recommendation of the late Mr. Vulliamy, not only authorised the continuance of the buildings in question, but also consented to future buildings being built up to the same line. In 1909 an owner was about to erect a building up to the 11-ft. line, when it was objected to, and the superintending architect, being required to define the building line, certified it as being the old 50-ft. line. The Tribunal of Appeal confirmed his certificate. The Divisional Court were divided in opinion, Mr. Justice Lush being against upholding the architect's certificate, and Mr. Justice Ridley in favour of it. The Court of Appeal agreed with Mr. Justice Lush. They held that the council could not override what had been authorised and approved in 1867 by the Board of Works as the general line of building frontage, and that that was now the general line of building for the portion of the road in question. The owner's appeal was therefore allowed.

* * *

Smoke Abatement.

Among the nuisances which may be abated summarily under the Public Health Act, 1875, is "any chimney, not being the chimney of a private dwelling-house, sending forth black smoke in such quantity as to be a nuisance." From a legal point of view, therefore, the domestic fireplace is above suspicion, but, as was shown by Mr. J. C. Dawes in a paper on "Air Pollution by Coal Smoke," which he read at the Royal Sanitary Institute Congress at Blackpool, hygienically it is the arch-offender. This is a fact, however, which has only been fully recognised in recent years, for the phraseology of the Act of 1875 is reproduced in the Public Health (London) Act which was passed sixteen years later. So far as factory smoke is concerned much good work in the direction of abatement has already been accomplished. Indeed, manufacturers themselves have been convinced of the economic wastefulness of the production of large quantities of black smoke. In the case of the ordinary householder, however, there is a strong sentiment to be overcome before any substantial improvement is achieved; but now that it can be said with truth that the domestic hearth is doing much more harm than the mill or factory furnace, it is surely time that some organised effort should be made for the education of public opinion on this important subject. The practical result of the presence of smoke in the atmosphere may easily be seen in time of fog. As Mr. Dawes observed, it is only necessary to contrast the clean cloud which envelops a country district with the poisonous pall which hangs over a town, in order to see the difference which exists between the ordinary standard of the purity of the air in the two places. Moreover, the harmful effect of the obscuring of the sun's rays is itself a serious matter, for the sun is the greatest and cheapest disinfector which is possible. Mr. Dawes' paper dealt thoughtfully with a most important question which ought to be kept constantly in the forefront in hygienic propagandist work.

* * *

New Examinations.

The decision of the council of the Institution of Municipal and County Engineers to hold special certificate examinations in town planning and county and highway engineering respectively is thoroughly justified by the great importance which has been assumed by these subjects in recent years. The regulations and syllabuses which were issued recently show that the new examinations are not intended in any way to supplant or interfere with the old "Testamur" examination. They are meant rather to afford candidates a chance of demonstrating their special knowledge of these subjects, and there is little doubt that the opportunity is one which many will be eager to seize. The first examination will be held in October next. The syllabus in town planning comprises a general knowledge of Part II. of the Housing, Town Planning, &c., Act, 1909, and the Local Government Board regulations thereunder, the suitability of an area for town planning, natural features, buildings, building lines, streets, and the provision of parks, open spaces, playing fields, and allotments. The examination in county and highway engineering is equally comprehensive, and in each case the written papers will be supplemented not only by a *viva voce* examination, but also by practical field work. In addition, all candidates must produce drawings certified by the engineer under whom they are working, or by some other responsible person approved by the council of the institution, as having been prepared solely by the candidate himself. The secretary of the institution will be pleased to answer any inquiries on the matter.

* * *

The Cole Testimonial.

The decision to mark the retirement of Mr. Thomas Cole, ASSOC.M.INST.C.E., from the office of secretary to the Institution of Municipal and County Engineers by the presentation of a testimonial is one which will meet with approval in all quarters. It would be impossible to estimate the share which Mr. Cole has taken in evolving from very small beginnings the large and flourishing organisation which now exists, and the debt which is owing to him, both by the institution and the profession, is one which can never be discharged. Those who know Mr. Cole best are confident that he will value the testimonial, not only in proportion to its value, but in direct ratio to its representative character. In the words of the circular which has been issued, it will gladden the heart of the late secretary in his retirement if he can be informed that every member of the institution has contributed within the very modest limits which have been fixed. Mr. Cole's energies are by no means yet exhausted, and, as we were able to announce in our last issue, in addition to acting as consulting secretary to the institution he is entering into a partnership with a view to private practice. His many friends will unite in wishing him every success in his new venture, and in hoping that his advice and experience will be available for many years to come in the interests of the institution to which he is so much attached.

Fourth Annual Report of the Road Board.

IMPORTANT DEVELOPMENTS: COUNTY SCHEMES: GRANTS IN GREATER LONDON: CONDITIONS IN SCOTLAND AND IRELAND.

The report of the Road Board for the financial year ended March 31, 1914 [illegible] to which reference was made in last week's issue, is a very interesting document, setting forth the policy of the board with regard to different areas and different classes of roads, and recording the methods and purposes of the grants and loans allotted in the preceding twelve months. Very important observations are made with reference to conditions in Ireland, in Scotland, and in the London area, and the board's [illegible] and recommendations with regard to these areas are set forth in very plain terms. Comprehensive schemes are in hand for the improvement of [illegible] in each of these areas, and the board [illegible] a great advantage of being prepared beforehand with schemes for works to be undertaken in periods of trade depression.

	£
Grants made and indicated up to 31st March, 1914	3,829,105
Balance available at 31st March, 1914 for grants on assumption that receipts to 30th September, 1915 may be anticipated	2,170,895

PURPOSES OF GRANTS AND LOANS.

The purposes for which grants and loans have been made are shown in tables, separately, for the three parts of the United Kingdom, but it will be sufficient to reproduce here the table for the kingdom as a whole, the more important of the figures for England and Wales, and for Scotland and Ireland, being separately stated below.

Classification.	From May 6th to 31st March 1913.		During year ended 31st March 1914.		Total to 31st March 1914.	
	Grants.	Loans.	Grants.	Loans.	Grants.	Loans.
	£	£	£	£	£	£
Improvement of road crusts	913,400	105,170	987,174	283,292	1,900,574	388,462
Road widenings and improvement of curves, gradients, and corners ...	88,068	1,200	76,186	9,656	164,194	10,956
Road diversions	24,250	—	29,066	3,664	53,275	3,664
Reconstruction and improvement of bridges ...	14,177	—	22,415	280	66,892	280
New roads and bridges	60,578	—	22,920	—	83,498	—
Total	1,130,732	106,470	1,137,711	296,892	2,268,433	403,362
Less loans repaid	—	4,767	—	27,337	—	32,104
	1,130,732	101,703	1,137,711	269,555	2,268,433	371,258
Total grants and loans, less repayments	£1,232,425		£1,407,266		£2,639,691	

The receipts from motor spirit duties amounted to £789,703, an increase of £105,393 over the year 1913; [illegible] carriage licence duties £666,248 (increase £117,353); interest and profit on investments and loans, £86,447 (increase £29,649); total, £1,481,398 (increase £252,395). Administrative expenses amounted to £15,690; payments under grants to £639,713; under loans, £296,892. The gross total of payments was £952,295, or, deducting £27,336, loans repaid, a nett total of £924,959. An adjustment of these figures, crediting outstanding sums, shows that the motor spirit duties really yielded £757,334 in 1914, an increase of 7·8 per cent; and the carriage licence duties £570,815, an increase of 15·6 per cent.

In view of the intervals between the dates of "indicating" loans and grants, and the dates at which the money is actually paid over, the board feels justified in indicating grants and loans to an amount of £414,025 in excess of nett income.

AMOUNT AVAILABLE FOR GRANTS AND LOANS.

The board are convinced they can in making grants anticipate income for a period of at least eighteen months. They are therefore at the present time making grants on the assumption that they can safely indicate a sum of about £2,200,000 in addition to [illegible] up to March 31, 1914. The following statement has been compiled to show how that figure has been arrived at:—

	£
Receipts of the fund from May, 1910 to 31st March, 1914	4,810,818
Estimated receipts from 31st March, 1914 to September, 1915 ...	2,270,000
	7,080,818
Less Administrative expenses to 30th September, 1915—	80,818
	7,000,000
Set aside for works to be carried out in a period of trade depression and meanwhile used for other loans for road improvement, [illegible] to the extent of £1,384,757 have been redeemed, but the additional amount can be provided out of floating balances of grants)	1,000,000
	6,000,000

ENGLAND AND WALES.

Classification.	During year ended 31st March, 1914.		Total to 31st March, 1914.	
	Grants.	Loans.	Grants.	Loans.
	£	£	£	£
Improvement of road crusts	865,839	254,654	1,566,832	350,390
Road widenings and improvement of curves, gradients and corners ...	68,179	9,156	149,650	10,456
Road diversions	27,076	3,404	43,001	3,404
Reconstruction and improvement of bridges	19,713	—	57,898	—
Total	1,003,727	267,214	1,901,779	364,250
Total grants and loans less repayments	£1,245,747		£2,230,067	

SCOTLAND.

	£	£	£	£
Improvement of road crusts	61,593	21,764	191,778	27,477
Road widenings and improvement of curves, gradients and corners	7,297	500	12,088	500

Total ...	72,688	22,804	221,384	28,517
Total grants and loans, less repayments	£94,308		£248,717	

IRELAND.

	£	£	£	£
Improvement of road crusts	59,736	6,874	141,964	10,595
Road widenings and improvement of curves, gradients and corners ...	800	—	2,456	—
Road diversions	700	—	700	—
Reconstruction and improvement of bridges	60	—	150	—
Total	61,296	6,874	145,270	10,595
Total grants and loans, less repayments	£67,212		£164,907	

In England and Wales there was an expenditure of £22,920 on new roads and bridges, bringing the total under this head to £83,498; but there has been no expenditure on new roads and bridges in Scotland, nor in Ireland.

As regards grants and loans indicated, but not yet formally made, amounting to £2,542,917, detailed classification is not possible; but, apart from the sum of £400,000 for the proposed Brentford loop road, the bulk of this sum will be expended on the improvement of road crusts.

With respect to the expenditure on road crusts, paragraph 16 of the report may be quoted in full, as follows:—

"The experience hitherto gained by the board as to the views and requirements of highway authorities, and as to the condition and needs of roads throughout the country, has confirmed them in the opinion expressed in previous annual reports, that the most pressing and the most universal need is the strengthening and improvement of the crusts (which include consolidation as well as surface coatings) of existing roads. In a few districts important roads are so narrow that they need widening before any other improvement is attempted, and these cases are specially dealt with as applications are submitted to the board; but the general need of most rural and inter-urban roads is that they should be made as rapidly as possible fit to carry the increasing motor traffic satisfactorily to the road user, and without undue deterioration of the road surface. This is the view almost universally expressed by the representatives of highway authorities in charge of rural and inter-urban roads. Consequently, the board have concentrated their efforts towards assisting the improvement of road crusts, and after the important roads requiring this kind of improvement have been dealt with, they will be able to assist more freely than they have hitherto done other kinds of road improvement."

With reference to reconstruction, it is pointed out that the amount of such work which can be undertaken is limited by the difficulty of providing for the initial cost. The board have therefore encouraged as a rule, except in special cases, be directed from the more important main roads to roads of lesser public importance.

"In those cases where a district road of real importance has not been maintained in consequence of some definite limitation of policy on the part of a county council, or has, owing to changes in the character or volume of the traffic, become of such importance that it should be declared a main road, and the county council are prepared to 'main' it, the board always endeavour to give favourable consideration to applications for advances for the purpose of enabling the district council to carry out the works required to be done as a condition precedent to the maining of such roads."

As an example of this policy, the road from Lewes to Newhaven is to be improved at a cost of £33,619, the Road Board making a grant of £17,619, and the East Sussex County Council and the district council making each a contribution of £8,000, and this road will be declared a main road.

The total length of district roads which are being improved by means of advances, and which will be maintained as main roads by the county councils, is 74 miles, of which 26 miles are in England and 48 miles in Wales.

GRANTS IN GREATER LONDON.

Since, under the conditions of the London area, it is impossible for the board to make grants to the county council for the improvement of main roads, so that the benefit may be shared by all the ratepayers, as in other counties, the board has decided to make an allotment of funds in the area of the Metropolitan Police District, or Greater London.

The board have provisionally allocated, for the purposes of works in Greater London, a sum of £960,000 out of the total amount of £6,000,000 shown to be available for grants up to the present time.

County.	Mileage included in the scheme.	Total expenditure proposed.	Grant.	Loan.	Total initial expenditure of county council.	Periods over which repayments of loan are spread.
		£	£	£	£	
Buckinghamshire	8	27,407	14,000	6,200	13,207	4 years.
Cambridge	21	28,693	15,773	10,000	12,920	5 years.
Cheshire	23	37,247	—	30,000	37,247	5 years.
Durham	31½	55,003	15,800	9,400	39,203	5 years.
Hereford	22	37,430	13,963	19,000	23,467	up to 6 years.
Middlesex	5	30,668	5,431	23,700	25,237	7 years.
Montgomery	15	23,942	6,500	15,000	17,442	6 years.
Northampton	14½	60,030	19,000	25,000	41,030	5 years.
Oxford	63	109,324	56,321	31,450	53,003	3 to 6 years.
Soke of Peterborough	5½	14,985	7,185	7,800	7,800	6 years.

East Sussex	20	54,678	22,278	30,500	32,400	4 to 6 years.
West Sussex	29	41,041	16,000	25,000	25,041	7 years.
Warwickshire	40	90,950	46,675	23,410	44,275	6 years.
	367½	689,758	265,926	294,585	423,832	

several highway authorities to undertake comprehensive schemes, with the help of grants, and loans free of interest. The above table gives particulars of schemes in one Welsh and thirteen English counties.

Since the average cost per mile is between £1,800 and £1,900, it is clear that the work of reconstruction is to be carried out very thoroughly. These schemes enable the highway authorities to obtain suitable plant, to make favourable arrangements for the supply of materials, and to economise by concentrating work on a single straightforward job. As regards widths, the board, "although fully favour as much land as possible being secured between fences for footpaths or grass margins, do not encourage the widening of the metalled portion of carriageways through rural areas beyond 18 ft., as they are of opinion that this width is generally adequate for traffic purposes except in the immediate vicinity of towns."

MAIN AND DISTRICT ROADS.

Every application made by a district council, whether by a direct application or through a county council, is considered by the board; but the main roads usually include a large proportion of the mileage of the most important roads in a county, and a grant to a county council relieves all district ratepayers in the county, while a grant to a district council benefits only the ratepayers of the particular district.

"Unless, therefore, the district work possesses some feature of general public importance which entitles it to special consideration, it does not appear to the board that, either in the interest of public traffic or in the interests of the ratepayers, the funds available

This provisional allocation has been dealt with as follows:—

	£	£
Allocation as above		960,000
Less Grants made and indicated		
Construction of new Brentford Loop Road	400,000	
County boroughs in Greater London	55,000	
Metropolitan borough councils	127,000	
Highway authorities in extra London ...	220,000	
		802,000
Balance now available for grants by anticipating income up to 30th September, 1915		158,000

The above-mentioned provisional allocation has been made in the ratio of population as between the area of Greater London and the rest of the United Kingdom. The board consider that the population ratio is the most favourable basis for London which they can legitimately adopt at the present time. It gives London, owing to its dense population, a considerable advantage as compared with districts having a lower population density in relation to the roads which they are obliged to maintain.

As regards the claims which are made for London on the ground that consideration should be given to the large amount collected in London from motor licence duties and the consumption of motor spirit, the report is explicit and convincing. "The general public interest must be considered. . . . It is easy

[illegible] metropolitan area."

The board have therefore decided to allot not more [illegible] on the basis of population ratio."

SCOTLAND

"Scottish authorities contend that the roads in their districts, which are used by through motor traffic, would not call for exceptional expenditure if it were only a question of maintaining the roads for [illegible] To admit this contention would ignore the obligation which rests on the authorities to maintain the roads in [illegible] through or local, but the board recognise that, while substantially the whole cost of maintenance has to be borne by local authorities, there is sound justification for the attitude adopted, and in dealing with cases of the character referred to they have endeavoured as far as practicable to meet the special circumstances of the districts by contributing so far as their funds would permit exceptionally large proportions of the total expenditure on road crust work in respect of which applications have been made to [illegible] having regard to local circumstances."

IRELAND.

In Ireland there is a serious administrative and financial difficulty in that only about a quarter of the total of duties on motor vehicles is collected. The amount of duty collected in the year ended March 31, 1911, was £19,057, and in the year ended March 31, 1913, only £16,567, estimated as a little over 25 per cent of the proper total. The board, in making grants, feel compelled to take into consideration the steps taken in each county to collect the duties.

"Progress in road development work in Ireland is seriously handicapped by the existing system of administration under which county councils, although the maintenance of all rural roads rests with them, are unable to incur any expenditure, even on roads of the first importance, until such expenditure has been proposed and approved by rural district councils.

"It appears to the board to be very desirable that this system should be altered by legislation at an early date so as to secure that the highway authority responsible for the execution of maintenance work should be able to determine the work to be done and the expenditure to be incurred. It would be essential as a preliminary to such legislation that the roads should be classified. . . ."

WORKS IN PERIODS OF TRADE DEPRESSION.

It is pointed out in the report that it is essential that works intended to be carried out in periods of trade depression should be settled in advance. Otherwise delay would occur just when progress with work and expenditure became desirable. Very few schemes have yet been suggested, and the board is considering what steps can be taken to encourage and facilitate proposals. The [illegible] character as to afford the maximum employment of labour. Ordinary street widenings in urban areas would not usually be suitable, but the board is prepared to consider such schemes when the highway authorities have acquired, or are willing to acquire, the necessary property, and seek the help of the board towards proposed expenditure on labour and materials.

Change of Address. Messrs. S. H. Morden & Co., Limited, announce that they have removed from 11 Tothill-street to Morden House, Westminster, S.W.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

* * * *

What is this we hear about some special electrical treatment at Liverpool which renders milk perfectly immune from dangerous bacilli? How does it differ from ordinary sterilised milk, and is it free from the objections there are to such milk?

* * * *

Is there any truth in the contention raised by some local authorities that the conversion of privies, pail closets, &c., into water-closets tends to throw an extra burden upon the sewage disposal works? Is there not the other argument that the collection of the refuse from these out-of-date "conveniences" is saved? And should not this saving be more than a set-off against any small addition to the sewage disposal works?

* * * *

What has been the experience in this country of wind-engine water pumping installations? Have there been any large number of such installations for public water supplies, and how many have been "scrapped" as being useless? Is not the wind a too uncertain factor to be relied on, even if ample provision for storage is secured?

* * * *

Will not the proposed imposition of ½d. per mile run by motor omnibuses on the proposed Great West Road out of London defeat the very object for which this road is to be made? Will not the omnibuses naturally prefer to still use the "free" road through Hammersmith, and the congestion of the traffic be as bad as ever? What do the shopkeepers in the "free" streets say to the proposal?

* * * *

What will be the outcome of Dr. Gilbert Fowler's and Mr. Mumford's experiments on the oxidation of sewage without the aid of filters? If the process can be applied successfully on a large scale, will it not be a mere question of £ *s. d.* as to whether it will not supersede the present tank plus filtration methods in vogue? Is not the paper given by Messrs. Ardern and Lockett to the Manchester Section of the Society of Chemical Industry on this subject well worthy of our most careful consideration?

* * * *

When will the Road Improvement Association let us know the result of the 100 guinea Horseshoe competition? Have they found a shoe which will not damage the surface of our roads and at the same time keep a "horse on his legs" under all conditions of gradients, slipperiness, and so forth?

* * * *

Will the gas fire ever be as popular as the coal fire? Although it may be more economical, clean, convenient, and give sufficient heat, can it ever replace the friendly and cheerful, if often varying and exasperating, coal fire? Is there not a depressing sameness about a gas fire in a sitting-room?

* * * *

Is it not rather a shock to find that the Camberwell Borough Council still retain a "refuse" siding close to the Southwark Infirmary, although they have repeatedly been urged to do away with it? Is it a matter of surprise to find that the proximity of this refuse siding produces dangers, dust and flies, and that there are several cases of enteritis among children in the infirmary which are alleged to have broken out through this cause?

* * * *

Was it not on the introduction of Hancock's steam carriage on the roads that the wiseacres of those days succeeded in squashing the attempt to introduce mechanical traction on the roads by leaving deep, new metal on the surface, and by other equally barbarous methods? Does not history repeat itself when we find that Parliament is trying similar methods of "squashing" the motor omnibus? Is it not a fact that ever since the introduction of mechanical traffic the law has endeavoured to put obstacles in the way of progress? And is it not nearly always the case that law and science are antagonistic?

Institution of Municipal and County Engineers.

MEETING AT HACKNEY.

A meeting of the Institution of Municipal and County Engineers was held in the Metropolitan District at the Town Hall, Hackney, on Saturday afternoon, when there were present Mr. J. S. Pickering, president, in the chair, and Messrs. J. Pullar Barbour (Paisley), E. J. Barnes (Stafford), L. M. Bell (Penang), J. Birch (East Ham), A. W. Caine (Stoke Newington), W. Nisbet Blair (St. Pancras), C. A. Clews (Derby), J. W. Cockrill (Great Yarmouth), T. Cole (Westminster, consulting secretary), R. Collins (Enfield), W. R. Collins (Lowestoft), A. C. Cousins (Hornsey), A. E. Darby (Bethnal Green), E. J. Elford (Southend-on-Sea), A. Gladwell (Eton), A. D. Greatorex (West Bromwich), A. J. Green (Hampstead), W. Harpur (Cardiff), F. Harris (Tonbridge), P. T. Harrison (Chelmsford), T. W. A. Hazard (Battersea), L. R. Impey (Ipswich), P. G. Killick (Finsbury), H. Leadbetter (West Ham), T. N. Mc Reath (Plymouth), F. E. Marsh (Singapore), F. Massie (Wakefield), A. P. Piggott (Stoke Newington), W. H. Prescott (Tottenham), J. W. D. Robinson (Westminster, secretary), N. Scorgie (Hackney, hon. district secretary), G. M. Seels (New Malden), J. P. Spencer (Tynemouth), H. E. Stilgoe (Birmingham), H. D. Strange (Dorchester), W. Stubbs (Blackburn), W. H. Taylor (Aylesbury), R. J. Thomas (Buckinghamshire), H. T. Wakelam (Middlesex), H. A. White (Battersea), J. Williams (Hampstead) and O. E. Winter (Hampstead).

The members were received in the council chamber by the Mayor of Hackney (Councillor Charles Winkley, J.P.), who said that in welcoming the representatives of the institution he was welcoming men of business, men who had very great responsibilities thrust upon them, and whose advice members of local authorities had to rely on to guide them in the discharge of their duties. Councillors had to look to them continually for their advice, and unless they were able to give good, sound advice on every occasion when it was required, it stood to reason difficulties would be experienced. Feeling the responsibility that rested upon them, the members of the institution made a practice of visiting different parts of the country with the object of exchanging ideas, and of seeing what was being done in other districts, utilising the information they obtained for the benefit of their own towns. It was a great pleasure to him to welcome the institution to Hackney, and he was sure that under the guidance of their engineer, Mr. Scorgie, they could rely on not going away without seeing much that would be of interest to them. Apart from the electricity and destructor works which they were to visit later, he might refer to the condition of their roads. Hackney was a very large borough and had considerably over 100 miles of streets, and speaking as a motorist he could say there were few boroughs that could boast of such road surfaces as they had. He trusted their visit would be of advantage, and at the same time of very great pleasure to them.

The PRESIDENT expressed appreciation of the presence of his Worship, and returned thanks for the very kind welcome which had been accorded to the members. Their esteemed friend Mr. Scorgie had, with the assistance of Mr. Robinson, the borough electrical engineer, and Mr. Bryan, chief engineer to the Metropolitan Water Board—who was one of their members—arranged a programme from which he was sure they would gain a very great deal of information that would not only be beneficial to themselves, but profitable to the authorities whom they represented. As mayor of that important borough, he was sure his Worship would recognise the advantages to the community of an institution such as theirs. As the responsibilities of local authorities increased year by year, so the work of the municipal and county engineer gained in importance and became more exacting; and it was owing to the educational facilities afforded by their institution that they were better able to discharge the duties that devolved upon them as public officials. The official who stayed at home with the object of gaining experience in his own particular town was not likely to carry out his duties as efficiently as the engineer who rubbed shoulders with his *confrères*; and it was therefore very desirable in the interests of the public that local authorities should give every facility and encouragement to their officials to attend such meetings as that. The mayor's very kindly welcome that day showed them that his Worship was in sympathy with their objects, and they were exceedingly obliged to him.

The MAYOR acknowledged, and looked that he considered it only a part of his duties to give facilities for such gatherings as that, realising that the more they were able to rub shoulders, exchange ideas, and criticise each other's work, the better it was for the authorities they represented.

ALTERATIONS IN ARTICLES OF ASSOCIATION.

The ordinary meeting was suspended at this point for the holding of a special meeting.

The SECRETARY read the minutes of the special general meeting held at Cheltenham on June 24th last, when resolutions as to alterations in the Articles of Association were passed.

The PRESIDENT formally moved the confirmation of the minutes, Mr. A. D. GREATOREX (West Bromwich) seconded, and it was agreed to.

The ordinary meeting of the institution was then resumed and consideration given to the subjoined paper:—

NOTES ON THE REFUSE DESTRUCTOR WORKS AND ELECTRICITY UNDERTAKING OF THE BOROUGH OF HACKNEY, N.E.

By LEONARD L. ROBINSON, M.I.E.E., M.I.MECH.E.,
Borough Electrical Engineer.

The electricity works were opened on October 31, 1901, and since then a general supply of direct current at 240 and 480 volts has been given for all purposes except traction.

The Hackney Council's area of supply consists of the whole of the Borough of Hackney, as defined by the Hackney Electric Lighting Order, 1893. The area is 3,299 acres, the population about 230,000, and the rateable value £1,250,000.

DESTRUCTOR UNDERTAKING.

The author's department has nothing to do with the collection of the refuse, this work being done by contractors under the supervision of the medical officer of health.

The contractors' vans are weighed as they enter the works, the contents are then tipped into the hoppers of elevators, and the vans are reweighed as they leave, so that an accurate record is kept of the weight of refuse received, and the figures thus obtained are used for works statistics as well as forming the basis upon which the contractors' accounts are paid.

There are three buckets and rake elevators, each driven by a 7½ b.h.p. series wound motor, which are each capable of raising from 10 to 11 tons of refuse per hour. The author's experience of these elevators has not been at all favourable. They are very expensive to maintain, liable to serious breaks down, and their capacity seriously limits the rate at which vans can be unloaded at the rush times, which occur between 11 a.m. and 1 p.m., and 5 p.m. and 7 p.m.

The total amount of refuse to be dealt with in a year is about 39,000 tons, but there are times when over short periods it is desirable to unload vans at a much greater rate than 20 tons per hour, to which the elevators limit the working, as it is generally necessary to have one of the three sets of plant out of commission for repairs.

Storage bins are provided over the cells with accommodation which is supposed to be sufficient for a day's supply of refuse; but the character of the refuse varies greatly, and when it is bulky the storage accommodation is too small, and much labour and time is lost in trimming down, in order to make the most of the accommodation. From the storage bins the refuse has to be raked into the charging doors of the furnaces, and this, again, is a laborious job owing to the varying and often binding nature of the refuse. The whole of the elevating and storing plant is a forcible example of what ought not to be done, and the author greatly favours the skip system of collecting, storing, and cell charging, a very excellent example of which is installed at Rotterdam.

The destructor proper consists of three units of plant, each as follows: Elevator and storage bins, as described above. Four furnace cells, two of which

keep the dampers tight, and therefore much valuable heat is lost to the chimney.

of refuse burned per twenty-four hours is 15 to 16 tons per cell with a 3-in. water gauge draught at the fans. Three 15 b.h.p. electrically driven fans are for the work. Each of the three boilers is a Babcock & Wilcox and has a heating surface of 2,852 sq. ft., and an integral superheater of 389 sq. ft.

and 10 ft. in diameter. It serves both the destructor and the old coal-fired boiler-house. A lining of fire-brick with air space is carried up inside about 80 ft. There is a Green's economiser of 258 tubes at the boilers and the coal-fired boilers in the electricity works. It would be much wiser to have a small economiser behind each boiler, but the economiser as at present arranged doubtless serves to some extent to use much of the heat which escapes into the by-pass flues.

The clinker is taken from the cells in steel wheel barrows and wheeled to the cooling yard, whence it is carted at a cost of 1s. 4d. per ton. It will be observed that the destructor is an old one, and far from up to date; but it is by no means lacking in interest, as it is a good object lesson as to what should not be repeated in future designs, and from its faults the author possesses valuable data as to the kind of lay-out that should be adopted when the time comes to build a new destructor.

The following data is taken from the author's report for one year ended March 31, 1913, that being the eleventh completed year in which the destructor had been in operation.

During the year 39,019 tons of refuse have been destroyed. The largest quantity received in any one day was 212 tons, and the smallest quantity 53 tons, the average daily quantity being 128 tons. From the total quantity of refuse delivered 269 tons of tins, scrap metal, &c., and 17,203 tons of clinker, flue dust, and fine ash were removed.

The following is an analysis of the dust destructor

consists of the difference between the electricity and destructor departments. The loan charges on the destructor capital are borne by the [illegible] and a proportion of the charges on the capital of that [illegible]. For the purpose of estimating the value to the local council, we [illegible] and endeavour to estimate a value [illegible] determined by experiment extending over a week, and at present stands at 3·51 lb. This figure is multiplied by the number of units generated during the year, and the product turned into money at the average price paid for coal during the year. From this sum the actual total price paid for coal is deducted, and the balance represents the credit due to the public health department for the heat supplied.

It is doubtful whether the system is really a satisfactory one, but it is extremely difficult to find a better system. However, it probably saddles the electricity department with a heavier boiler-house cost than it would have to meet if it were independent of a destructor. For instance, the boiler repairs which are undertaken by the electricity department are heavier than with coal-fired boilers, and the economiser, which would last for many years if dealing only with the flue gases from coal fires, requires complete renewal every five or six years when subject to the corrosive action of destructor gases. Then, again, the steaming of the destructor is variable, and the electricity department cannot rely upon getting most steam at the time they want it most. Probably, if the value were ascertained, as set out above, and subjected to a deduction of 20 to 30 per cent, the result would more nearly approximate the true value of the services rendered.

ELECTRICITY UNDERTAKING.

The electricity works adjoin the destructor works, and, as explained in the last section of this description, both works share the same chimney.

Coal is obtained by barging from ships in the Thames up the river Lea, which also supplies the condensing water. Make-up water to the hot well and water for domestic purposes is secured from the London chalk by means of an 8-in. bore artesian well 460 ft. deep. A compressed-air lift pump is installed, and can supply about 6,000 gallons per hour.

The original boiler-house contains eight Babcock & Wilcox land type boilers. Four have each a heating surface of 2,852 sq. ft., with integral superheaters of 389 sq. ft. two have each a heating surface of 4,020 sq. ft. with integral superheaters of 452 sq. ft., and two have each a heating surface of 4,226 sq. ft., with integral superheaters of 660 sq ft.

The working pressure is 200 lb. per square inch, and the draught and the natural draught of the chimney 200 ft. high. . . .

Item.	1911/1912.	1912/1913.	Cost per ton. 1911/12.	Cost per ton. 1912/13.	Rise.	Fall.
	£ s. d.	£ s. d.	d.	d.	d.	d.
Oil, waste, water and stores	52 14 10	55 11 3	0·38	0·34	—	0·04
Repairs, &c.	300 12 7	623 8 6	3·01	3·83	0·82	
Wages of workmen and sick pay	3,270 6 7	3,235 0 6	20·05	20·20	0·15	
Repairs and maintenance	302 14 3	727 19 1	3·07	4·48	1·41	
Clinker disposal	1,044 15 11	1,090 4 7	6·20	6·39	0·19	
Rents, rates and taxes	111 8 9	423 14 5	2·52	2·61	0·09	
Management expenses, &c.	210 10 8	265 17 7	1·30	1·64	0·34	
Total working costs	5,092 3 7	6,420 15 11	37·13	39·44	2·33	

In addition to the foregoing expenditure for the year 1912-13, the repayment of principal and interest amounted to £2,732 19s. 11d.

The nett expenditure upon the destructor revenue account, after crediting the value of the heat transferred to the electricity undertaking, £2,293 13s. 9d., and sundry receipts, £240 0s. 5d., was £6,620 1s. 8d., which is at the rate of 3s. 4·7d. per ton.

The capital cost of the works was:—

	Total expenditure to 31st March, 1913.
	£ s. d.
1. [illegible]	2,569 17 0
2. To buildings	16,969 3 1
3. To plant	19,543 11 7
	£39,082 11 8

[Here follows a statement of refuse received and by-products removed during a period of eleven years.]

It may be of interest to say a word on the vexed

The feed pumps are situated in a room at one end of the boiler-house over the hot well. There are three Weir steam pumps and one Hayward Tyler motor-driven turbine pump, the latter being the most popular and doing the greater part of the work. There are also two small electrically driven three-throw Worthington pumps. The condensed steam is freed of oil by aluminia sulphate in a home-made plant, and reused with the addition of make-up water from the artesian well. The water is soft, and the boilers only require opening up once a year.

In the old engine-room there are six sets of triple-expansion condensing engines, two of 300-kw. capacity by Willans & Robinson and Holmes, two of 600-kw. capacity by Bellis & Morcom and Holmes, one of 1,500-kw. capacity by Bellis & Morcom and Westinghouse, one of 1,500-kw. capacity by Bellis & Morcom and Dick Kerr.

All the condensers are of the surface-condensing type, with motor-driven circulating water and

Edwards' type air pumps. The condensing water is taken from the river Lea through two 18-in. pipes through a suitable screen to chambers, and discharged on a 27-in. pipe some distance down stream. Although the river is canalised, no trouble has been experienced with over-heating, because there is a large traffic on the river, consequently over 3,000,000 gallons per day are used by the locks, and thus a frequent change of water is provided.

Although the engines [illegible] cannot compete with the economy of turbines, they have done good service, and during the first nine years of the history the undertaking held the proud position of having the lowest cost of generating and distributing in the Metropolis, and it was only eaten by Stepney and Poplar, which have modern turbines installed, upon which the bulk of their load is placed. . . .

EXTENSIONS.

Some few years ago it was realised that the original mains had been laid down altogether too conservative lines, that larger generating sets must be installed, and that to continue the generation and transmission at low-tension direct current would not be economical. The author therefore prepared a scheme involving the ultimate expenditure of some £200,000. The general outline of the new scheme provides for the generation of three-phase alternating current at 6,000 to 6,500 volts at 50 periods on the three-phase system. Part of this supply will be converted at the Millfields-road works, for which purpose a 1,000-kw. La Cour converter is being installed, and as the old engines become obsolete they will be scrapped, and their places taken by synchronous motors driving the existing dynamos, which will be good for many years to come. The three-phase supply will also be transmitted to substations in the area of supply, and converted to direct-current at the supply pressure, or, in cases of very large supplies, the raw mains may be looped into consumers' premises to give supplies of three-phase current.

The new building is built on to the old works, and is a steel-frame structure with concrete panels, roofed with reinforced glass and asbestos tiles.

The turbine-room follows the line of the old engine-room, and the boiler-house runs at right-angles to the turbine-room. Parallel with the turbine room are a basement for cables and air filters, ground-floor gallery for mess-room, and E.H.T. switchgear, and first-floor gallery for engineers' offices and control board.

The turbine-room is of sufficient size to accommodate one 3,000-kw. turbo-alternator, and two 5,000-kw. turbo-alternators. The 3,000-kw. set is in course of erection, and the first 5,000-kw. set is on order.

The boiler-house is being erected in two sections, the first of which is nearing completion; the total accommodation for eight 30,000-lb. to 40,000-lb. per hour boilers, the first two of which are in course of erection. Above the boilers there is accommodation for large economisers and ejector-type induced draught plant. At the northern extremity of the site a steel-frame concrete building is being erected for housing the circulating water pumps, and adjacent thereto is the screening chamber for the water intake. Above the boiler-house there is a large coal bunker in four compartments, having a total capacity of about 1,300 tons, which is fed by a duplicate telpher plant with a capacity of 40 tons per hour. . . .

OUTPUT AND REVENUE.

The present output of the works is about 8,584,246 units sold per annum, and the maximum load last year was 5,254-kw. The load factor is about 18 per cent to 21 per cent. The capital at March 31, 1914, was £411,207. The surplus revenue in each year, after providing for interest and redemption, has been: 1903, £2,254; 1904, £5,516; 1905, £5,478; 1906, £4,094; 1907, £2,886; 1908, £1,412; 1909, £1,718; 1910, £6,124; 1911, £7,708; 1912, £9,519; 1913, £8,882; 1914, £7,024.

The author trusts that he has managed to touch upon the chief points of interest in the Hackney undertaking. These short notes cannot be claimed to be fully descriptive, but they have had to be prepared at short notice, and the author will be glad to answer inquiries which members of your institution may care to make.

DISCUSSION OF MR. ROBINSON'S PAPER.

Mr. E. J. ELFORD (Southend-on-Sea), in proposing a vote of thanks to Mr. Robinson, asked if the latter could give some further particulars in regard to the home-made plant used for separating oil from condensed steam. It might be interesting to some of them. There was only one other point he would like to mention. Mr. Robinson spoke of the turbine pump as being one of the most popular in connection with the old plant, yet in the new plant they had adopted the reciprocating type. Was there any special reason for that?

Mr. A. GRAFWELL ELSOM, secretary, said he understood nothing about electricity, but he thought the thanks of the meeting were due to Mr. Robinson for taking the trouble to compile the notes as he called them—descriptive of the Hackney electricity and refuse destructor works, which ought to prove exceedingly useful to them when they in turn had their undertakings.

Mr. R. COLLINS (Enfield), referring to the author's statement of refuse received and by-products removed over a period of eleven years, inquired whether Mr. Robinson could give the increase in population each year.

Mr. W. HARPUR (Cardiff) observed that the cost per ton of refuse burnt appeared to be rather high, and asked whether any explanation of that could be given.

Mr. W. NISBET BLAIR (St. Pancras) said he had also been looking at these figures. He could not see how one could make 20·2d. per ton for labour in destroying refuse. The total cost in his district was 1s. 4d. There was a figure for electricity included. He took it that referred to power supplied to the works; but was there no credit given for heat supplied by the destructor?

The PRESIDENT (Mr. J. S. Pickering) expressed his personal thanks to Mr. Robinson for coming in at a late hour to write the paper, which would be exceedingly useful to them. He thought they could take a lesson from his remarks, inasmuch as he had given them examples of what ought not to be done. He took it from that that he was not responsible for the works he had described, but many of them were rather inclined to hide bad work. The cost of the refuse destruction seemed to be exceedingly high, and he thought Mr. Robinson would agree that with a more modern destructor he would be able to reduce it. Mr. Blair had stated that the cost at St. Pancras was 1s. 6d., but at Cheltenham they rarely exceeded 1s. per ton. Everything depended on circumstances, however. He had been struck with the high percentage of clinker—45 per cent which showed that the combustion was not very thorough. One generally got about 33 per cent.

The vote of thanks was passed.

Mr. ROBINSON, in replying, stated that the oil-eliminating apparatus to which Mr. Elford had referred was originally an old Goodman's softener for dealing with very hard water they received from the town main. After a time they decided to bore their own well, and they were lucky enough to strike water which was fairly good for boilers without any treatment. Formerly the water was treated by coke filters, but that became too troublesome an operation, so he moved up the old tanks of the Goodman filter, and arranged that the water coming in was pumped up into a sort of horizontal turbine which, in revolving, discharged a large portion of its water direct to the reaction tank, at the same time a large portion was trapped off and went into the reagent tank. The reagent they used was alumina sulphate. As to the question why, if the old turbine pump was so popular, he did not adopt that class of pump in the new works, at the time the new works were designed the turbine pump had only just been put to work, and on starting gave a deal of trouble. Eventually it had to go back to the makers and was entirely reconstructed. It was now giving perfect satisfaction. With regard to the increase of population, he had not got those figures, and he did not think that any were available. He believed, however, the population of Hackney was now more or less stationary. The cost per ton of destroying refuse was admittedly high, but the same thing applied to all the London stations. The labour question there—especially in connection with that work—was extremely troublesome, and no doubt a great deal was added to the cost by the elevators and the amount of trimming. Out of 20·2d. per ton for destruction, he did not think more than 1s. or 1s. 2d. could be allocated to the destruction of the refuse. The rest was due to handling by bad methods. The charge for electricity was fairly high, for the elevators consumed a lot of energy, which was supplied at ¾d. per unit. That was fairly low, and they would observe that there was a credit of £2,293 for the power obtained from the burning of the refuse.

[illegible] the year 1829 an Act of Parliament was obtained to [illegible] Lea between Lea Bridge Mills, in the parish of St. [illegible] of St. Mary's, Stratford, Bow. The company purchased the Lea Bridge Mills and the Hackney waterworks, and made their intake on the Hackney side of the river Lea, and constructed a reservoir also in the parish of Hackney, and a channel was cut parallel to the River Lea Navigation from Lea Bridge to supply water to the then existing reservoirs at Old Ford, the intake being thus above all tidal influence. In the [illegible] Act of Parliament was obtained enabling the company to carry their intakes further up the river, to abandon the intake at Lea Bridge, [illegible] at Walthamstow, and to make at Lea Bridge on the Essex side of the river, and to convert the reservoir on the Hackney side of the river into filter-beds. At the same time the open channels for conveying water to Old Ford were abandoned, and a large cast-iron main laid from Lea Bridge to Old Ford to conduct the filtered water to the pumping plant at the latter station.

The Lea Bridge works cover an area of about 60 acres, the filter-beds, twenty-five in number, nearly 25 acres. There are two wells in the chalk, with a total length of heading of about 2 miles, and numerous boreholes have been sunk below the bottom of the headings.

The pumping plant consists of four vertical triple-expansion engines capable of lifting 52,000,000 gallons daily; three Cornish, 29,000,000 gallons; two compound rotary pumping engines, 8,000,000 gallons; one compound horizontal, 3,000,000 gallons; four turbines, 2,750,000 gallons; triple-expansion Worthington, 10,000,000 gallons; in addition, two horizontal engines for pumping water from the wells to the surface of the ground.

THE KING GEORGE'S RESERVOIR

This is situated partly in Middlesex and partly in Essex, the nearest railway station being Enfield Lock (Great Eastern Railway). The top water area of this [illegible] when [illegible] contain 3,073 [illegible]

[illegible] practically [illegible] the [illegible] and carry [illegible] and [illegible] at the present time. The extreme length of the reservoir at water line is 1 mile 1,190 yds. The main banks of the reservoir contain about 2,400,000 cub. yds. of earth, of which 253,000 cub. yds. are puddle. The inner banks are lined with about 105,000 sq. yds. of concrete and brick paving.

A brick channel takes the "stored" water in a southerly direction to Chingford Mill, where it joins former channels connected to the chain of reservoirs commencing near Higham Hill.

All the other reservoirs are filled by gravitation with the exception of the Banbury and Lockwood reservoirs, which can only be filled to half their capacity in this manner, and water is pumped into them from a pumping station ½ mile south of Chingford Mill by three vertical compound pumping engines, attached to which are centrifugal pumps each capable of delivering 40,000,000 gallons per day into the reservoirs.

The Humphrey pumps have created unusual interest by reason of the fact that the plant is unique in waterworks construction. There are four pumps with a capacity of 40,000,000 gallons per day each, and one pump of 20,000,000 gallons capacity.

Each pump may be looked upon as a gas engine and pump combined, but without piston, crosshead, connecting rod, crankshaft, flywheel, bearings, gearing or stuffing boxes.

The action of the pump can be best understood by picturing a horizontal pipe connected by two bends at its ends with a vertical closed-top combustion chamber and an open top water tower respectively. The parts thus connected are nearly full of water, forming a heavy mass or column, which is made to oscillate under the action of the explosion. This oscillation is quite free, and occurs in such a manner that the movement of water causes the intake of a fresh combustible mixture, the compression of the mixture, the explosion and expansion which give the power stroke, and the exhaust of the burnt products. There are thus four primary movements of the water during each cycle, two being from the combustion chamber towards the tower, and two in the opposite direction. With the explosion of one pump 12 tons of water can be delivered into the reservoir.

On returning to Hackney the members were entertained to tea at the town hall by Mr. Scorgie.

THE CHELTENHAM MEETING: GENERAL ENGINEERING SUBJECTS.

Mr. T. W. A. Hayward, vice-president, occupied the chair at the meeting at Cheltenham at which papers on General Engineering were taken, the first of these being the following:—

ORGANISATION OF A MUNICIPAL ENGINEER'S DEPARTMENT.

By Edward Willis, Assoc.M.Inst.C.E., F.S.I., Engineer and Surveyor to the Chiswick Urban District Council.

A thorough knowledge of organisation is most important to every engineer and surveyor having the management of any large town or city. It is also especially important to the young engineer appointed to a small district, since, although he will not have a large staff, it usually becomes necessary systematically to apportion his time and the time even of an assistant, pupil, or office boy, in such a manner that it can be utilised to the best advantage, and no portion of the necessary work appertaining to his department be neglected. . . .

In approaching the subject the author is met with the initial difficulty of the large variation in the work and responsibilities that the municipal engineer has to undertake, and he therefore proposes to deal briefly with only those duties which appertain to practically all appointments, while he will touch but very lightly upon those branches of the department which in large towns and cities are often placed under a separate head, but which in the smaller towns are usually added to the multifarious responsibilities placed upon and undertaken by the modern municipal engineer and surveyor.

Assuming that it is possible to create a new and complete department, the author would suggest the following main headings as the basis of its organisation:—

(*a*) Highways.
(*b*) Sewerage and sewage disposal works.
(*c*) Architectural work and supervision of buildings.
(*d*) Open spaces, parks, and pleasure grounds.
(*e*) Collection, removal, and disposal of house refuse.
(*f*) Sanitary administration, including public conveniences.
(*g*) Housing and town planning.
(*h*) Fire protection and extinction.
(*i*) Stores and depots.
(*j*) Miscellaneous.
(*k*) Establishment and staff.

The real essence of good organisation is the efficient and harmonious working of each section of all departments, with no friction or wasted time where two sections overlap or become interwoven. It is often in this overlapping between the separate sections of a department that most difficulties arise, loss of time is incurred, and individual character, ability, and tact are required to avoid friction.

In the creation of a department for a new small urban district it will probably be found that a very small staff will be allowed for a considerable amount of work, and this must result in several sections of the work being thrown upon one individual. If, however, the scheme is properly thought out and organised, its development will be automatic with the increased prosperity of the district, and no reorganisation, with its consequent possible upheavals and heartburnings, should ever become necessary.

It may be desirable before dealing with the above sub-headings to say a few words about the *personnel* of a staff.

In considering the smallest type of urban district,

it may be assumed the staff of the municipal engineer's department consists of one man, described in that most comprehensive word "The Survey." If his council are particularly generous he may have the advantage of a pupil and office boy. In this case but little organisation of staff will become necessary, but the organisation of work is a *sine qua non* if the administration of the district is to be efficient, and no harm can result from the scheme of such work being considered on broad, but definite, lines. In fact, the man that can grasp and deal with his work on broad lines is individually the most useful and best organised, provided he can likewise appreciate the importance of detail.

In the case, however, of an average municipal engineer's office in a town of, say, from 10,000 to 50,000 inhabitants, the circumstances are undoubtedly very different from the foregoing. The borough or district is probably already in a flourishing condition. It may be a quiet town, or it may be rapidly developing, the latter being probably the case in a town or suburb immediately adjoining the Metropolis or some of the great cities of the Empire, or in one which is being developed owing to the creation of a thriving industry within its boundaries.

Any schemes for expansion or possible decentralisation must therefore be anticipated and provided for, the individual abilities of each member of the staff should be appreciated to a nicety, the work in each section of the department should be defined and systematic; supervision should be accorded to all; absolute punctuality should be enforced, and integrity of thought as well as of deed should be fostered.

It might be here mentioned that some officials, while being absolutely above reproach in financial matters, still have not grasped that absolute integrity includes principles as well as actions, and the head of a department who can feel that not only integrity, but absolute loyalty to himself, permeates every member of his department is indeed fortunate, and such a knowledge is very helpful when the anxieties and worries of dealing with the numerous members of a large corporation weigh unduly heavily upon him.

It cannot be too much emphasised that a true *esprit de corps* should exist in every official, from the highest to the lowest, to ensure that perfect harmony in work which gives the most beneficial results to the council and ratepayers at large, and therefore any scheme which an engineer can advance to further this spirit will not only redound to his credit, but will probably add to his popularity, and make every individual member of the staff willingly throw his whole energies into his daily work, and not cavil or murmur when the exigencies of the public service necessitate hours of overtime, often without any thanks from his council.

HIGHWAYS.

As the construction and management of highways created the necessity for the surveyor and engineer, so it still ranks as one of the most important duties attaching to his department, and in the majority of districts it is organised as a separate section or sub-department.

The number of men engaged in maintenance and supervision must of necessity be governed by the area and the traffic throughout the district, but in practice the author advises that existing highways should be dealt with separately from the construction of new highways, since the latter largely consist of private street works and street improvements, and as such are subject to more detailed drawing and office work than the maintenance of existing roads.

The author is of opinion that even in a small district it is wise to make one man responsible for the administration of this sub-department, so that the entire maintenance of the existing roads and footpaths of a district are in his hands. He would then have charge of watering, scavenging, and repairs, including all team labour, manual labour and stores used upon public highways.

The question of improvements to existing highways and lighting in a small district is also left in this official's hands; but where the administration of a large town or city is to be dealt with, he is of opinion that the supervision of both improvements and lighting can be relegated to two other officials, who can personally report to him and specialise in their particular work.

Some engineers require personal reporting daily from the head of each sub-department, and this system has many advantages. At the same time the author has found in practice that there are equally great disadvantages, since in his own experience he has wasted hours in obtaining access to his chief to report sometimes comparatively trivial matters, and the procedure he has adopted in his own office is to obtain all reports in writing from the foregoing officials, who attend for interviews only when required.

Before concluding these observations on existing highways the author would like to emphasise the desirability of not only recording the materials and labour expended on repairs through the outgoing stores notes, but also the advisability of keeping abstracts, charts, and maps of the district showing exactly, from time to time, with the date attached, the amount of recoating carriageways or repaving footpaths carried out each year, and, as far as possible, the prime cost should be kept of all such work and reduced to a definite standard.

While advocating this the author must admit he has been unable, with a limited staff, to keep entirely to this standard of perfection; but he still advises the continuance of such a system as being ultimately conducive to both economy and efficiency.

With reference to watering, he has made a practice of attaching to each water van a small skeleton map of the beat, with positions of all road-watering posts shown thereon, as this tends to prevent the continual waste of time which will constantly occur where the number of road-watering posts is limited, and enables a better check to be maintained over the employees.

The question of scavenging with gangs or one-man beats is a vexed question, and in most districts too little money is spent on this important work. The quality of the labour also is often far from satisfactory, any man being considered fit to handle a broom. This is not the author's experience, as he has found that one man can often do twice the amount of work as another, and that such work is often more efficiently performed.

While the principle of pensions is not applicable to municipal labour in most districts, his council has endeavoured to reward the genuine workman who has laboured many years in the municipal service by relieving him of practically all his duties and paying him a nominal wage of 8*s.* per week (in effect a pension). This, in the case of a man over seventy years of age, can be supplemented by the Old Age Pension, and while the total amount is still small, the result, in most cases, prevents the man going into the workhouse, and thus relieves the district of aged labour, lessens Poor Law expenditure, and reduces the risk of accident.

The author considers new highways, especially private street works, can often in a large district be left in the hands of one capable assistant, with one or two pupils or draughtsmen to assist him, since uniformity in practice with private street work and apportionments is conducive to lessening of friction with speculating builders and small property owners.

Should the district have adopted the Private Street Works Act, the preparation of both provisional and final apportionments somewhat increases the clerical work in the engineer's department, and the author has found in practice that some of this can readily be carried out by a pupil or clerk when properly instructed.

It is desirable that provisional and final apportionment books be kept in lieu of loose sheets, and that such books should give full particulars of the ownership, frontage, estimate, final account and final apportionment, so that the past history of a private street can easily be traced without the necessity of unduly "wading through" numerous loose papers.

In some districts it is customary to have an absolutely standard specification and drawing for private street works; but this has not been the author's practice, since what may be desirable for one highway may be totally unsuitable for another, and in recent years under this heading the author has used from 9 in. to 21 in. of total formation, and the followed finished surfaces: 9 in. to 6 in. of flints; flints tar-painted and finished with granite chippings; tarred granite; tarred clinker finished with tarred limestone; Guernsey granite finished with Tarvia and granite chippings.

One other point before leaving this subject may be usefully mentioned. Where trees in streets are generally adopted, they may often be included in the private street works specification and estimate with advantage as well as grass margins, if the cost of maintenance can be reasonably afforded.

Careful records of remaining and renumbering must also be kept, as certificates are commonly being required when property changes hands.

SEWERAGE AND SEWAGE DISPOSAL WORKS.

In this sub-department the author suggests the separation of new and existing sewers from sewage disposal works; in fact, in all large towns and cities such a separation is a sine qua non, in many cases the sewage disposal being undertaken by a joint board, and dealt with either by a sea outfall or bacterial treatment.

The variations in the management of sewage disposal works are, of course, entirely governed by the [illegible] and capacity of the works and the quantity of sewage treated; but it cannot be emphasised too strongly that where the outfall discharges into a non-tidal stream absolute adherence to instructions is essential, especially in the case of contact beds, where three shifts in twenty-four hours is adopted. In this case there is no excuse for lack of attention at night-time, but when men are working twelve or thirteen hours through the night, under little or no supervision, the author has found neglect sometimes exists.

The author has made a practice of supervising or inspecting personally at all hours of the day and night, without notice, and he has found this has eliminated to a large extent the risk of serious neglect by his men.

Under the heading of "Sewerage" he suggests separating the management of new and existing sewers so far as the individual staff is concerned. This, of course, would again have reference to a large district, or one rapidly developing, and in practice he has found that the outdoor building department can well supervise the laying of new sewers without undue overlapping, since the majority of these are laid in new streets by private estate owners.

Maintenance, flushing and connections to sewers should be as far as possible under the control of one man, who should be solely responsible for seeing to the actual work of the sub-department, but in practice it is often found desirable to arrange for house connections to be supervised by the building department, which, as an inspector should be upon the works daily, saves time and eliminates overlapping of inspection.

It is needless to detail the many sub-headings that would apply in this section, but the author would emphasise the importance of any spare time being spent on keeping the surveys and levels absolutely up to date, and shown on the standard ordnance maps of the district, since he finds that the map mentioned under sec. 20 of the Public Health Act, 1875, is seldom complete; yet probably every engineer of a large district will daily reap the benefit of such a map if and when completed. The surface and invert levels should be entered on such maps at every manhole or change of direction or gradient.

OPEN SPACES.

In dealing with this important section of a municipal engineer's work, it may again be reasonably subdivided under the following headings:—

Maintenance of existing open spaces.
Provision of new open spaces.

Briefly referring to the latter heading, the first consideration is defining the most suitable position and negotiating for it. This, of course, is exclusively a matter for the head of the department, probably in conjunction with the clerk of the council.

The design and lay-out, construction of walks, banks, flower beds, shrubberies, gymnasia, drainage, water supply, chalets, conveniences, &c., would be best prepared by the indoor staff and the supervision undertaken by the outdoor staff.

A matter which is now continually before municipal engineers is the desirability or otherwise of executing certain new works by means of direct labour. The author has had experience of both the contract and administration system to some large extent, and he is of opinion that there are many works in which direct labour can be economically adopted; but if they are to be successful and economy is to result, the engineer should have an absolutely free hand in regard to the employment of labour, and should be exonerated from the risk of criticism before the work starts, should he find it necessary to modify the labour conditions.

The question of direct labour is one which, at some time or other, is bound to be considered by every municipal engineer, and no one should neglect to take advantage of the experience of his *confrères* in this matter. Personally, the author has consistently adopted direct labour on new sewerage works and open spaces with both satisfactory and economical results, while he has found it also beneficial in the construction of open-air baths and various road improvements; but where buildings are to be erected, or where there is any question of payment by other persons, such as in private street works, he prefers the contract system.

With reference to the maintenance and financial aspect of existing open spaces, he is of opinion that the best organisation can be obtained by making the senior man at each open space responsible directly to him or one officer for the proper maintenance, mowing, pruning, turfing, and upkeep of footpaths, roads, ponds, &c. The quarterly payments in respect of footballs and cricket pitches should be made at the chief office of the engineer or accountant, while small payments in respect of tennis courts, bowling greens, conveniences, &c., should be received by the senior employee, and accounted for daily or weekly to the engineer.

In this, as in all other cases where officials or employees are receiving monies, a guarantee policy should be obtained and the premium paid by the council, so that no ultimate loss can possibly be sustained through the carelessness of such officials or employees.

The systematic upkeep of iron and wood work is often neglected through carelessness, bad organisation, or false economy, and therefore one cannot be too careful in clearly defining the word "maintenance."

ARCHITECTURAL WORK AND SUPERVISION OF BUILDINGS.

This department can be best divided into two main headings—viz., indoor and outdoor work. Alternatively the departments might well be as follows: (1) Supervision of new streets and buildings under by-laws, and (2) design and construction of any architectural works.

There is of necessity considerable indoor work as well as outdoor supervision attaching to each of these, and the principle to be adopted must be decided by the engineer when reorganising. In practice his hands may be tied by the provision of a private Act enforcing the employment and defining the duties of building inspectors, in which case in some of the private Acts provision has also been made for the acquirement of fees in respect of supervision, such private Acts having been based upon the London Building Act. When such fees are obtainable the salaries of the building inspectors are paid therefrom, and it is a moot point how far their time can legally be allocated to other work.

The author had considerable experience in this department under Mr. O. Claude Robson, M.INST.C.E., an esteemed past-president of this institution and engineer to the Willesden Urban District Council, a town which was for many years the most populous urban district in the kingdom, and the organisation in this department was practically ideal.

Owing to the magnitude of the building operations at one time a staff of five building inspectors was maintained out of the fees received for supervision, and in this and other cases the R.I.B.A., Inst.C.E., Inst.M. and Cy.E., or S.I. qualifications were a *sine qua non*. One building inspector undertook the major portion of the indoor work, which consisted largely of checking drawings and advising architects, builders, or owners upon plans, receiving fees, and general management of department, while the other inspectors carried out the whole of supervision in certain defined areas, recording and tabulating the results, which were submitted monthly to the council.

The duties included the necessary surveys of all new streets and buildings, thus keeping the ordnance maps up to date, while new estate sewers were also supervised and recorded by this department, as previously noted.

The architectural department should consist of one or more capable assistants or architectural draughtsmen, since it is utterly impossible for the engineer to do more than sketch his designs, and of course their working out often requires considerable time and experience. In most offices both the architectural and engineering drawings are prepared in one general drawing office, and it is usually desirable to make one assistant, preferably with both engineering and architectural knowledge, the head of such office.

As a general rule this assistant should receive all instructions from the chief respecting the preparation of drawings, the making of surveys for improvements,

the general office drawing routine work, the preparation of estimates and the writing of specifications, but it is also desirable that the engineer should take a personal interest in the actual work of every member of his department, since by that means alone can he obtain a true insight into each assistant's individual character and ability for certain work, and thus select those most suitable for advancement.

The author would advise that the fire protection department should be assisted by the building inspectors in respect of means of escape in case of fire under the Factory and Workshops Act, and the sewerage department in respect of the provision for elimination of petrol from sewers, since both matters can best be dealt with by these officials without any overlapping in supervision. Too much care cannot be exercised in properly organising the systematic inspection and efficiency of all fire exits and also of all petrol filters, garages, or cleaning works where benzine or other inflammable spirit is much used.

The powers of local authorities are sufficiently defined to enable the sewers to be properly protected from the infiltration of inflammable spirit from private houses, garages, &c., but there will always remain the difficulty of soakage or washing from the surface of the carriageway, and to this extent the road inspectors or gangers should have instructions to immediately report to the sewerage department and the engineer any signs of excessive petrol or other oils on the carriageway, and until the sewer into which the oils may have drained is properly ventilated no access should be allowed thereto. The only overlapping involved by the above can be easily met by a written communication in duplicate.

COLLECTION, REMOVAL, AND DISPOSAL OF HOUSE REFUSE.

While this is one of the most important duties usually devolving upon the municipal engineer, it is equally one of the most unpleasant, and is probably the cause of more complaints than any other sub-department.

He must consider first the method of collection and disposal. Collection may be by contract or direct labour, and in each case by either horse haulage or motor traction.

Briefly, motor traction is beneficial where the shoot, deposit, or destructor is at a distance, or it can be economically adopted where the dusthins are placed on the footpath at night and are emptied daily. Direct labour can usually be more efficiently supervised and leads to fewer complaints than contract labour.

Having decided on the system, definite beats should be allocated to certain vans and collectors, and the collection from each beat should be completed each day. If this work is carried out properly no complaints should arise, but the author has found some difficulty in entirely avoiding these, owing partly to the substitution of other men during sickness or accident and the interference with normal organisation during holiday seasons, such as Christmas, Easter, Whitsun, &c.

Some difficulties are also experienced in regard to empty houses or access to occupied houses when no one is at home, but the author's practice on such occasions is to deliver a card stating when the next collection will be made, and the men report on tabulated sheets the reason for non-collection. By this means it is possible to check whether non-collection is through the carelessness of the men or the temporary absence of the occupier.

In the disposal of house refuse, a proper record should be kept of the quantity received, preferably by means of a weighbridge at the destructor, or the number and size of van loads at the shoot. This record should be checked with corresponding periods in previous years, and also with the average daily quantity, which should show a gradual increase with the growth of the district.

Special care is also required in testing the tare weight of collecting vehicles, since although it is wise to record the tare on every vehicle, dust vans are especially liable to be incorrect, owing to the inclusion of "tots," glasses, tins, shovels, baskets, &c., and unless special care is exercised in the clearing out of the vehicle, a considerable excess weight over the actual amount collected may be shown. This, in the case of piecework, may not always be accidental, and to avoid it the only proper method is to tare these vehicles out after every load.

In connection with the destructor, proper records should be kept, preferably in tabular form, of the amount of steam raised, water and coal (if any) consumed, power used for pumping or other purposes, quantity of clinker made, amount of clinker broken in crusher and used for special purposes, such as mortar, brick and flag making, tarred clinker for roads, &c., and a careful analysis of the cost of other materials and labour throughout, so that comparison may be made with corresponding figures at different periods and those of other local authorities, which, with proper allowances for varying conditions, form a good guide as to the economy and efficiency with which this section of the department is being administered.

In the case of extensive repairs to chimney shafts, main flues, &c., provision will have to be made for the removal of the refuse, by road, rail or water, to another destructor or shoot, and sufficient foresight must be exercised to avoid any interference with the normal daily collection and disposal of refuse.

SANITARY ADMINISTRATION (INCLUDING PUBLIC CONVENIENCES).

The sanitary administration work in an engineer's department varies very considerably in different localities.

In many places, especially the smaller urban and rural districts, the office of sanitary inspector and inspector of nuisances is combined with that of surveyor, and the same officer will therefore have full control of all practical sanitary administration.

In the larger districts such is never the case, the sanitary inspector being under the supervision of the medical officer as chief of the public health department.

The organisation in most districts requires sanitary work to new buildings, and alterations or additions, to be exclusively under the control of the engineer, while drainage work to old buildings is left entirely in the hands of the sanitary inspector. This arrangement avoids overlapping and possible friction. Any extra men that may be required by the medical officer's department are obtained from the engineer, but during such time the sanitary inspector is responsible for the efficient performance of their work. In large cities the medical officer should employ and certify for his own staff, but such an arrangement is not usual in the smaller districts.

Public conveniences should be exclusively under the control of the engineer, all employees in this sub-department being certified for by him.

It is desirable that one man should be made responsible for their efficient supervision and cleanliness, and should the attendants also collect monies it is imperative that the most careful records should be kept in tabulated books, and a daily return of such monies made to the engineer or accountant's staff, a signature being given both by the assistant receiving them and by the attendant. Even in spite of the utmost care, dishonesty is known to occur in this section of the engineer's department.

A careful analysis of figures for corresponding periods by different attendants may often enable petty thefts to be traced, and in all large cities the regular interchange of attendants on different conveniences will generally lessen the risk of theft or locate the thief.

HOUSING AND TOWN PLANNING.

The Act and the duties defined therein, so far as they affect the engineer and surveyor, may, I think, be divided into two main headings—viz., (1) the design and construction of town extensions, including the improvement of existing or the creation of new highways with artistic amenities, and (2) the procedure defined in the Act in connection with unhealthy dwellings or areas.

The author is of opinion that the former should be exclusively a matter for the engineer's department, while the latter must of necessity be worked by the public health department, either alone or in conjunction with the engineer's department. It seems desirable that all inspections in connection with the existing housing conditions should be carried out by the sanitary officers, and that the engineer should only step in when specifications are required or constructional work is to be carried out, or when the existing defective buildings are to be removed entirely and the area cleared.

In the case, however, of town planning, the whole work should be undertaken by the engineer's department. This, in a large district, may be well separated into two sections—viz., the outdoor work, which would include the preparation of all necessary surveys and contours, and the indoor work, which would consist

[illegible]

[illegible] PROTECTION AND EXTINCTION.

[illegible] may be considered under three headings, but as a rule only one would apply to any individual district, although a combination of two, if not three, is occasionally found.

They are: (1) Brigades and equipment entirely maintained at the expense of the ratepayers, (2) equipment maintained by the ratepayers and brigade practically voluntary, and (3) volunteer brigade and equipment maintained by voluntary subscription.

In the last case the engineer and surveyor would not be concerned directly, but would be exempt from active [illegible] as he would not be able by virtue of his municipal appointment.

The second arrangement is found to exist in a very large number of country towns and urban districts, and can and does prove, in most cases, a very efficient system of fire protection. As a general rule the brigade is made responsible for the upkeep of the appliances and [illegible] a paid caretaker, resident engineer or drivers, these men should also be under him, but the members of the volunteer brigade would be entirely outside his control, unless he were elected and appointed the chief officer.

The organisation should be on somewhat similar lines to that of a paid brigade so far as the equipment and administration is concerned, but there must necessarily be some dual control owing to the chief volunteer officer taking the command at fires, and this [illegible] to result in loss of efficiency.

It is most important if efficiency is to be maintained, and thus the expense of a paid brigade avoided, that the engineer should take every opportunity of furthering the brigade's interests and keeping the equipment up to a high standard, since by this means all members of the brigade are usually imbued with a similar desire for excellence.

A paid fire brigade should be provided with the best appliances and equipment, as is the case in all large cities of the Empire, especially the Metropolis.

The precise time that the volunteer system should give place to the organised fire department must, of course, be left to the local authority to decide, but [illegible] the engineer's judgment and advice may form a very important factor.

In a city or town exceeding 200,000 inhabitants the fire department may be organised under a chief officer in no way responsible to the engineer, but in the small towns the author suggests that the superintendent should be responsible to him as chief officer.

The area of the district must govern the question of central and branch stations (if any), but it may be assumed that, with modern appliances, centralisation is generally desirable, with a complete installation of reliable fire alarms. Extra sub-stations for isolated or distant areas, with limited equipment, may in some cases be useful but fire escapes and first aid appliances, as saving life is more important than extinction.

Fire appliances alone are worthy of a special paper, and no attempt is therefore made to deal with them.

The organisation of staff, if a small one, will require [illegible] to secure the largest number of men being available when required, and yet to make proper allowance for rest, recreation, and holidays.

Absolute discipline should be enforced at all times, as by this means the confidence of the ratepayers is obtained, and the men become thoroughly conversant with their duties. Drills and turn-outs should be frequent when fires are few, and *vice versa*.

Most careful records of all turn-outs, drills, false alarms, and defects in appliances, or neglect by men, should be kept, and not only filed, but actually used for reference purposes, as by this means similar troubles can often be avoided in future and improvements effected.

STORES AND DEPOTS.

A complete or even partial scheme of reorganisation in connection with central or branch depots and storeyards requires most careful consideration, since after the cost of buildings, stabling, and other structural works for the reception of horses, vans, motors, [illegible] have been incurred, the capital charge in the event of subsequent alteration will [illegible] largely wasted. The greatest care and ability must therefore be exercised by the engineer before making any recommendation, and he must consider not only the present, but also the ultimate possibilities and needs of the area of which he is the controlling officer.

It is difficult to lay down any hard or fast line as to centralisation, but it may be taken as an accepted fact that all horsed vehicles should be housed within a reasonable distance of the area upon which they are to be used. At the same time the multiplicity of storeyards or depots permanently increases the establishment charges, for which, as a general rule, a varying percentage is required to be added to the cost of works.

MISCELLANEOUS.

[illegible] would, of course, be included these important departments which are, in the larger municipalities, so often placed under a separate head, such as electricity generation, tramway construction and maintenance, gas manufacture and supply, water supply and distribution, management of markets, supervision of abattoirs, management of cemeteries and burial grounds, supervision of labourers' dwellings, baths and wash houses, and management of piers, harbours, &c.

It is impossible to detail even the principal points that should be considered in the organisation of any of these, but it may be assumed that the principles already enunciated are equally applicable to many of the above departments.

ESTABLISHMENT AND STAFF.

The author cannot conclude without making a few observations under this heading. In the earlier part of the paper it was pointed out that perfect loyalty and absolute integrity of thought and deed would tend to result in the development of an excellent staff.

In addition, every assistant should continue his studies by means of professional literature, lectures, &c., and always strive to learn and know more than is necessary for the work required of him, since by that means alone he is able to fit himself for a more responsible position.

Omitting many other points, one must only be emphasised—viz., the initialling and dating of all plans, drawings, or documents by the assistants or clerks engaged thereon, and the checking and initialling of all calculations, quantities, and certificates, and [illegible] cast in the midst of the multifarious duties which devolve upon this department for a slip to be made, but so difficult to restore that confidence which all desire and endeavour to merit.

DISCUSSION OF MR. WILLIS' PAPER.

Mr. J. S. Brodie (Blackpool) said his first general criticism was that Mr. Willis included far too much as belonging to the borough engineer's department, and under his control. Surely the ideal state of things for the borough engineer was this: A maximum of salary and a minimum of work. Now, acting on these broad lines he found that of eleven sub-departments at least four might with advantage be taken out. For instance, there was the collection, removal and disposal of house refuse; surely that was not for the borough engineer, but for some practical man responsible to some other department altogether, who could supervise the work much better. Sanitary administration, including public conveniences, was work for the medical officer of health, and far better carried out by a cleansing superintendent. They had a very useful function to perform, and it would not be done better if done under the supervision of the borough engineer. As to fire protection and extinction, were they to be dragged out of their beds at all times of the night to put a fire out? Let him do his work in the daytime, and let him have a good night's rest. Stores and depots; surely that was work for the accountant's department. Then, in regard to statistics, that was the work of the borough accountant's department. He would not bother his head with statistics at all. He had them got out and then made use of them when he received them. Having said that much of how he disagreed with Mr. Willis, he must commend the very thorough way in which he had gone into his subject. All of them who knew Mr. Willis knew him to be a young man of experience, ability and energy, and if he had fallen short of what he had given them in his paper, they would have been very much disappointed. He proposed a vote

or thanks to Mr. Willis for this most excellent and painstaking paper he had given to them.

Mr. J. W. COCKRILL (Great Yarmouth) said he was interested to join issue with his friend Mr. Brodie. If the surveyor had control of some of these items a good deal of confusion took place. If they had referred them to the medical officer of health, gave him half-a-dozen men to deal with, and did not get the latest half-dozen in the employment of the corporation, he knew nothing of men. As to town planning, nothing put contractors had not made sufficient of the matter. Before any town planning was talked about, had not everyone of them been carrying out parks and gardens and street widenings and improvements which were really town planning? If it had not been for them to advise what would have been the condition of the various towns? Take Mr. Willis: he had not a sufficient staff to enable him to keep up statistics, but he believed it could be better done under his supervision than in any other department. There was one very important point. Costs and observations with reference to road work should be taken most carefully, and he hoped they would all try to get together costs of maintenance and durability of the various kinds of road work in a way which would be useful to the institution in years to come.

Mr. S. PEACOCK (Keighley) said he regarded this paper as one of the best presented to the meeting. It certainly did Mr. Willis a great deal of credit, and said much for the thoroughness of the man. If the younger members of their profession would only master every clause in this paper it would lead to their reaching the topmost pinnacle of their ambition, because it would make them masters of the work they had to do. He did not quite agree with Mr. Brodie in his remarks. There was only one department which Mr. Willis had included which he thought the borough engineer could leave to another department, and that was fire protection and extinction. Surely the stores and depots should be under the control of the surveyor and not of the borough accountant. With regard to what Mr. Willis had said as to a true *esprit de corps* existing in every official, from the highest to the lowest, he considered that every borough surveyor ought to assist his assistants. If they read that clause and acted upon it, they would get a thoroughly harmonious feeling in each department of the surveyor's office. Each surveyor ought to think of the advantages which he could give to his assistants by helping them. (A Voice: We do.) He did not think the majority of surveyors had sufficiently realised their responsibility in this way. He could cite a case which happened a few months ago, where an assistant asked his chief for permission to attend a meeting, and the surveyor answered: "No; I do not go to those meetings, and I do not think you should." He thought a surveyor who did that had not a proper appreciation of his duty to his assistants. Let them treat their assistants as they would treat their own sons. There was only one other point, and that he would commend to any councillors who were present. Mr. Willis said his council had endeavoured to reward the genuine workman who had laboured many years in the municipal service by relieving him of practically all his duties, and paying him a nominal wage of 8s. per week. They ought to admire Mr. Willis for mentioning that in the interest of old workmen. They had an old pavior in Eccles who had put in fifty-two years' service—a typical Lancashire man. The council had given him a wage of 20s. a week, and for the last two years he had done practically nothing. If he felt well enough he went to the yard, and if they were taking up a road he acted as flagman. He thought if workmen had given good service their latter years should be days of peace and happiness.

Mr. F. W. PEARCE (Twickenham) supported the vote of thanks. He did not propose to criticise the paper in detail, because the information was so complete that he thought this was hardly necessary. He thought there were one or two useful points which might help them in dealing with the paper. The keynote of the paper seemed to be summed up in efficiency and economy, and those two items were generally very closely associated. It had been suggested that this paper should be recommended to the careful consideration of the younger members of the institution. He entirely supported that suggestion, and he should like to go a little further and suggest that it would prove very useful to the older ones when they found time to read it. He should like to suggest a practical application if there was any way of carrying it out—that was that this paper should be circulated to all members of local authorities. If that could be done, and if they could be induced to read of some of the difficulties under which their engineers had laboured in the past, he was convinced those difficulties would disappear. It only required the careful consideration by any business man of the proposals contained in this paper to enable him to have a clearer conception of the duties of the borough engineer and surveyor. It was quite true that in very large cities some of the items to which Mr. Willis had referred would of necessity have to be placed under other heads; but he was quite satisfied of this that, provided the engineer was of the calibre of the writer of this paper, the longer they could be deferred the better. He agreed with Mr. Cockrill that the attempt to take work and men from the surveyor's department and place them under the medical officer of health was a mistake. He said that without any disparagement of the medical officer of health, whose professional qualifications were high, but he had never been trained to control men, while the surveyor had been trained to control men. With regard to the questions dealt with in some detail in the paper, the question of statistics, the preparation of progress sheets and maps and accounts, he was convinced that this work should be done in the surveyor's department, and if possible he should have his own accountant rather than their accounts should be kept by another department. He was of opinion that if accounts of works in progress were kept in their own department money would be saved. If the whole work of a municipality could be brought down to a business proposition in the nature of money expended, and a strict analysis obtained of the money expended, so that when members of the local authority were dealing with such a question as the salary of the surveyor and his staff they would have all the details as a business proposition, there would not be the difficulties raised that there were to-day. Local authorities were too much inclined to question expenditure on a particular item rather than on the results obtained. They understood that what Mr. Willis had put before them was the ideal, but in all their work it was by placing the ideal before them and trying to get the ideal that it became the actual. He was satisfied if this paper could be rescued from the oblivion which sometimes awaited the productions of authors for the "Transactions," and it could be kept before every municipal engineer and surveyor, before every member of his staff, before every member of his local authority, and even the public, it would be a very good thing done.

Mr. E. S. SINNOTT (Gloucestershire) asked, with reference to statistics, if Mr. Willis had evolved any form or forms in connection with work which enabled one readily and at a glance by consulting the chart to keep an eye on the consumption of stores. He might mention in his own case his county council owned twenty-two steam rollers, and two petrol motor rollers, and lately he had got out a diagram by which he could see the consumption of coal, oil, and waste, and everything used in connection with each roller. He wanted to ask whether Mr. Willis had compiled or thought out any method by which the surveyor could at a glance control the action of those working under him. He had found it of very great value, because if one man was wasteful with coal, oil, or waste he could draw the superintendent's attention to it. He had not yet evolved any system in connection with police stations. They had a large number of police stations which he had to look after, and these required painting and papering, and so on, and he had gangs of workmen who were constantly on the move. Any gentleman who had charge of buildings would be rendering a great service to people like himself if they could give them the benefit of their knowledge.

Mr. F. C. COOK (Nuneaton) said many of the conclusions at which Mr. Willis had arrived were fairly obvious, but the conditions which obtained in different towns varied so much in character that one could not do more than lay down general principles. Looking at the chart, Mr. Willis had included many matters for which he, personally, should not care to take responsibility. He believed in doing nothing which would encroach upon the department of another officer, and he would take care that another officer did not encroach upon his own. There was a danger of the municipal engineer being regarded in the light of a local Pooh-Bah, against which they should guard. They should take care not to incur the

[illegible] Any system which tended to [illegible] personal factor in a subordinate, to [illegible] responsibility, or to deaden [illegible] was a mistake. He ventured to suggest it was a very good mistake to impose unnecessary clerical work upon [illegible] were unnecessary [illegible], and [illegible] had to make [illegible] certainly on [illegible] than to waste time by writing reports which would [illegible] letter upon the subject of them. He [illegible] in the office a little standard [illegible] in regard to [illegible]. They would not [illegible] with varying [illegible] at the expense of [illegible] for instance, if costs were all got out [illegible] He thought it would be a great service to the profession as a whole if they had a paper at some [illegible] conference to enable them to lay down some basis of common agreement in such matters.

The Chairman (Mr. F. W. A. Hayward) [illegible] when Mr. Ellis had said at the beginning of the discussion. He was not in agreement with him that certain matters could be better managed by the medical officer of health or the borough accountant. He thought if work was placed under their control they should see that work was done properly, and as Mr. Cousins suggested, keep it in their own hands. Every man should try to make it his ambition to make his appointment pay for itself, so that he could look back when he was retiring over the job in a far better position than when he accepted it. If that spirit animated everyone of them, they would be in a far better position than they were to-day.

Mr. Willis, in replying, said he should like to thank them very much for the very kindly way in which they had received the paper, and particularly those who had joined in the discussion and made such valuable remarks, even though they were in conflict with his suggestions. If that were so, the small amount of time which he had given to the paper had been more than repaid.

(To be continued.)

HERTFORDSHIRE SURVEYORSHIP.

APPOINTMENT OF MR. J. S. KILLICK.

The appointment of Mr. J. S. Killick, Assoc.M. Inst.C.E., assistant engineer to the Road Board, as county surveyor of Hertfordshire, in succession to Mr. Urban A. Smith, M.Inst.C.E., has been confirmed by the county council.

Mr. Killick, who will receive a commencing salary of £800 per annum, will commence his new duties on September 1st.

Winnipeg Water Supply.—Tenders for the construction of some 85 miles of aqueducts, in connection with the Shoal Lake water project, costing approximately £1,791,000, will be called for shortly (the *Standard* states) by the Administration Board of the Greater Winnipeg water district, and they will be opened on September 15th. The work will be divided into five sections, exclusive of the Indian Bay intake. The aqueduct will extend from the reservoir site beyond Transcona to the Shoal Lake end.

Direct *v.* Contract Labour.—The county surveyor of Monaghan, Mr. J. J. Hannigan, in the course of a report stated that in the Carrickmacross district there was £1,600 worth of works for which they could get no contractors, while in the Cootehill and Clones districts there was £1,242 worth of work for which no contractors could be found. All this went to show that the contract system had broken down, and the question they had now to consider was how the roads were to be maintained. Resolutions were read from the Carrickmacross, Cootehill, and Clones Rural District Councils approving of a scheme of direct labour. The chairman (Mr. Thos. Toal, J.P.) said there was no intention of having a scheme for the entire county. It was only for those roads for which they could not get contractors. In the Monaghan rural district the contract system was working satisfactorily, and that being the case he was opposed to a direct labour scheme for Monaghan. The council postponed the consideration of a direct labour scheme, and meanwhile decided to allow the assistant surveyor a commission of 2 per cent on the cost of the direct labour schemes they were called upon to supervise.

THE QUANTITY SYSTEM.

Some of the advantages of the quantity system of estimating as enumerated by Mr. G. Alexander Wright, of San Francisco, and given in the Toronto *Contract Record*, are as follow:—

(1) Saving of time and money.

(2) Greater precision in accounting.

(3) No uncertainty as to interpretation of plans or specifications (the quantities should govern).

(4) No visits to the architect's office often during, for explanations or otherwise.

(5) No other work is contracted for except the quantity set forth in the quantities.

(6) The contractor, if he so desires, can check up the quantities before signing the contract.

(7) No bidder can inadvertently leave out anything, and so in this way arrive at too low a figure.

(8) Not having to spend time taking out his quantities, the contractor has time to attend to more profitable business.

(9) Systematically arranged bills of quantities duly priced (whether work has been secured or not) form excellent data for making future estimates.

MAIN ROADS EXPENDITURE.

Replying to a question in the House of Commons on Wednesday, Mr. Herbert Samuel, President of the Local Government Board, presented the following statement showing the expenditure of county councils in England and Wales on main roads in certain years, and the amount of such expenditure estimated to have fallen upon rates:—

Year ended March.	Total expenditure	Amount of such expenditure estimated to have fallen upon the rates.†
	£	£
1891* ...	1,465,000	847,000
1900 ...	2,080,000	1,024,000
1910 ...	2,853,000	1,856,000
1912 ...	3,356,000	2,154,000

* This is the first complete year for which figures are available.

† The figures in column 3 are estimates only. They represent expenditure remaining after deducting the amounts estimated to have been met out of Exchequer grants and receipts other than rates and Exchequer grants.

Dissolution of Partnership.—We understand that the partnership between Messrs. G. P. Knowles, J. B. Knowles and K. D. D. Grazebrook, who carried on the business of consulting engineers and surveyors and the preparation of candidates for technical examinations at 39 Victoria-street, Westminster, S.W., under the style of "G. P. Knowles," has been dissolved by mutual consent so far as concerns Mr. J. B. Knowles, who has retired. Messrs. G. P. Knowles and K. D. D. Grazebrook will continue to carry on the business in partnership at the same address.

Stourbridge Waterworks Scheme.—The new pumping engine and other works carried out by the Stourbridge and District Water Board were formally inaugurated on Tuesday last. The scheme included deepening the borehole at Coalbournbrook, the construction of a 500,000-gallon reservoir at Doctor's Hill, the reorganisation of the mains, and the provision of pumping plant, and the cost was £18,000. The consulting engineer was Mr. W. Fiddian, and it was stated in the course of the proceedings that his estimates had proved quite accurate.

London Tramway Schemes.—The London County Council propose to construct a new tramway from King's-cross to Harrow-road *viâ* Euston-road, Marylebone-road, and Edgware-road. This scheme was recommended by the Royal Commission on London Traffic, and would abolish the dead-end in Harrow-road and link up the existing tramways in that thoroughfare with those at King's-cross, thus enabling through communication to be established between Willesden and the City and East London. Another proposed line is from Hampstead-road to Theobald's-road, *viâ* Tottenham-court-road, Bayley-street, and Russell-square. This scheme, part of which was recommended by the Royal Commission, will abolish the dead-ends at Hampstead-road and Theobald's-road.

Royal Sanitary Institute Congress at Blackpool.

ENGINEERING AND ARCHITECTURE SECTION.

"The Economical Supply of Hot Water to Artisans' Dwellings," by Alderman Henry Burridge, and "House Drainage: Some Observations on the Barrow-in-Furness System," by Mr. Arthur Race, borough surveyor of that town, were amongst the first papers to be considered in the Engineering and Architecture Section of the recent congress of the Royal Sanitary Institute at Blackpool. Some extracts from Alderman Burridge's contribution will be found in our issue of last week, p. 84.

HOUSE DRAINAGE.

Mr. Race said his belief was there could be no doubt that the disadvantages arising from the use of intercepting traps were substantial and of serious practical importance, and that some of the most dangerous effects arising out of the disadvantages were concealed from view, and might remain in existence quite unknown to the householder for a considerable time.

THE BARROW-IN-FURNESS SYSTEM.

The author proceeded to say that the chief feature of the Barrow-in-Furness system of house drainage was that the main house drain was not trapped from the sewer, a ventilating pipe being placed at the highest point of the drain, and acting as a ventilator both for the sewer and drains.

Proceeding, Mr Race said: "Where drainage of surface water from houses is required in the case of sewerage on the duplicate system, the rain water downspouts are connected into a bend of the drain, which is connected to the surface-water sewer without any trap whatever. I do not consider this method to be ideal, as the drains become choked at the bend, and it is often a considerable time before the chokage is discovered, injury to health and property often having occurred in the meantime due to dampness. A better method of dealing with this drain would, of course, be to discharge the rain water downspout on to a gully at the head of the drain. Where rain-water pipes have to be connected to a combined sewer they are connected to a back inlet gully or discharge on to a P trap.

"The size of pipes usually laid in drainage work in Barrow is 4 in. for rain-water pipes, yard gully, slop-stone and water-closet branches, the main drain being 6 in. diameter between the water-closet branch drain and the sewer. The gradient generally obtained is one of 1 in 30 for 4-in. pipes, and 1 in 40 for 6-in. pipes, and the joints are made with tarred gaskin or yarn, and cement and sand, 2 of cement to 1 of sand.

"Only pedestal wash-down closet pans are permitted to be used, and for internal water-closets the pan and trap must be in one piece. The joint between closet pan and lead bend through wall has to be either by a flanged joint bolted on or by using a brass thimble and Portland cement connection to the earthenware, having a wiped solder joint to the lead soil pipe."

Prior to 1912, when the system was amended, the connections from the internal water-closets, &c., were disconnected by a "Bristol" trap placed on the branches, a separate inlet and outlet ventilator being provided for such branches.

Continuing, Mr. Race said: "Now this system has been carried out in Barrow since about 1878, and, with a reservation regarding the 'Bristol' trap, it has proved eminently successful, and must have been far ahead of the times when introduced into Barrow by the then borough engineer, the late Mr. Jacobs. In addition to giving general satisfaction from a house drainage point of view it solves the difficulty of sewer ventilation (a serious problem in many towns), as there is a current of air in all sewers, air being admitted by the open manhole and lamphole covers in the streets and extracted by the ventilating shafts, which are provided at the head of every house drain, complaints from sewer smells being practically unknown in Barrow."

Good as the system had proved itself to be, after studying the findings of the Local Government Board's Departmental Committee, in 1912, the author considered whether or not the "Bristol" intercepting trap, as used in Barrow on branch drains to internal water-closets, &c., was not open to the very objections proved against the intercepting traps when used to disconnect house drains. He believes the intended duty of the "Bristol" trap was to prevent gases from the sewer and drain air finding their way into the building, either by way of (*a*) defective joints or pipes, (*b*) the temporary or permanent unsealing of sanitary fittings. There could be no question that gases from sewers and drains should be prevented from entering the house, and the question that arose was whether this could be better done with or without the "Bristol" trap. In order to investigate the matter the author obtained permission from owners of property in several parts of the borough to open up and break into the "Bristol" trap so that its actual state under varying conditions could be ascertained.

In the case of two terraces of houses (each house having on the ground floor a bath and water-closet connected into one drain, this being disconnected from the main house drain by a "Bristol" trap, the distance between the outlets of the bath and water-closet and the trap being not more than 2 ft.), cases were found where there was no seal in the trap, and in some other cases the traps were filthy, a considerable deposit of sewage being found on the house side of the trap. This is what was found where connections most favourable to the trap existed, and where the conditions were less favourable the result of the examination proved that the objections to the "Bristol" trap as used in Barrow are somewhat similar to those previously referred to regarding intercepting traps, and that the disadvantages of the "Bristol" trap outweigh any advantages it might possess.

It was found that a certain amount of sewage splashed on to the inside face of the trap above the water line, and particularly on to the fresh-air inlet, which is brought up to the yard level. The "Bristol" trap interfered with the proper flushing of the drain, and at its best prevents the free flow of sewage. Although it was better flushed, owing to its nearness to the sanitary fittings, than the intercepting trap as generally used in other towns, it was found in practice that it did get choked, and when that was the case gases were liable to be given off and escape into the yard by the inspection eye and fresh-air inlet, which was covered with a grate.

Mr. E. Willis (Chiswick), in proposing a vote of thanks to the authors of the papers, said he believed they would have to come round in the future to the Local Government Board's suggestion with regard to the avoidance of intercepting traps. The only point which they must go very carefully into was as to how they could properly ventilate the sewers when changing over. He had tried to get his council to drop the intercepting traps on new estates where every house took its due share of the ventilation of the sewers. He quite agreed with Mr. Race that the old-fashioned trap was perfectly useless and was a snare and a delusion, for it simply meant that they were collecting matter and giving off odour.

Mr. G. W. Lacey (Oswestry) said Mr. Burridge's system of supplying hot water to artisans' dwellings seemed a very practical and ingenious one. There appeared to be one difficulty with the arrangement. He thought it would be better if the supply of water to the boiler were governed by a ball valve. The stop-tap might be left running, which would not only obviate the possibility of getting hot water, but would result in waste. He would like to know whether Alderman Burridge had a separate flue to the boiler. The boiler had to serve a dual purpose, and he was not quite certain if the flue should be separated from the kitchen range flue. The cost given by the author was £10, without fixing, an amount that appeared to him to be somewhat excessive. They could buy a decent bath and provide the whole of the fixtures which were indicated at something more like £6 than £10.

Mr. C. J. Jenkin (Finchley) said that in the cottages they had built so far they had not given hot water. In his district the system adopted of getting water into the copper would be quite contrary to the regulations of the Water Board. With their regulations, if the pressure was taken off the main, and the copper was full of dirty water, the dirty water might be drawn back into the main. He understood the author mentioned the use of water from the copper

[illegible] of the drain, and, apparently, if any stoppages occurred they would have to pull up the brickwork. Another thing was—how did Mr. Race guarantee that the manholes on the street would act as inlets?

Mr. Race [illegible] and the question had been put as to how they were to deal with towns which at the present time had the intercepting system and wished to change over. He would say there would be some [illegible] and he would commence by adopting [illegible]. Then if in any part of the town [illegible] the corporation or the sanitary authority might take a certain number of the houses and alter the drainage system and do away with intercepting traps and put in a ventilating shaft. There were no separate shafts for ventilating drains in Halifax, and even in the residential districts, where they had detached houses, they had found no necessity for them. Mr. Jenkins mentioned a point about the necessity for an inspection chamber on the house drain. They took every precaution they could to see that the drains were properly laid in the first place, and his experience of the borough, extending over thirteen years, was that very little difficulty in stoppages or other defects in house drains occurred. They could not justify the expenditure of an inspection chamber to small houses. He did not say that they guaranteed the manholes in the streets to act as inlets, but he did say they had no complaints of smells from sewers.

Alderman Burridge said that what he had told them was not theoretical, but was actually in existence. They could clean the copper just as thoroughly as the kitchen range. With regard to the cost, he was very careful to give the maximum instead of the minimum cost. He put it down at £10, but if he had to do it himself he would say £7. As to the question of using the copper for a dual purpose, it did not matter whatever system they adopted, for they could not protect themselves against neglectful people. As a matter of fact, however, the washing of clothes occurred once a week, and the copper could be emptied easily and wiped out.

RECENT EXPERIMENTS IN SEWAGE TREATMENT.

Mr. J. D. Watson, M.Inst.C.E., chief engineer to the Birmingham, Tame and Rea District Drainage Board, said he had been asked to give some of the results of his recent experiments in sewage treatment. The protracted hot summer of 1911 emphasised a phase of sewage purification which up to that time we in this country had paid little attention to—namely, the relationship between aërial nuisance and the aërobic decomposition of sewage. It then became apparent that even on small works greater attention to this question was desirable, and in some cases imperative.

As a general principle, objectionable smell should be reduced to a minimum, or, to be more accurate, to the lowest point possible compared to reasonable expenditure. He was not sanguine enough to believe that sewage could ever be purified without producing some objectionable odour, but he saw no reason why such work should not be done without attracting the attention of residents in the vicinity of the works, unless the atmospheric conditions were very unpropitious. It should not be forgotten that much could be done before the sewage ever reached the outfall works, for the production of malodours was greatly facilitated by badly designed and carelessly managed sewerage systems. Not the least important part of the work was efficient house drainage if even the best designed and managed sewage system was to fulfil its functions and trasmit foul liquid to the outfall before decomposition set in. When the drainage area was large many hours sometimes elapsed before sewage from the outskirts reached the outfall.

Assuming that the aërobic treatment of sewage was desirable, and he thought there could be no doubt that it was so for at least eight months of the year, [illegible] to what objectionable smell was due to, and how it could be avoided, became very important. As he understood the question, the elimination of sulphuretted hydrogen, or the prevention of its formation, would in nine cases out of ten render the sewage practically odourless. With regard to the prevention of its formation, Dr. Soper, of New York, had been of opinion for many years that the introduction of a sufficient volume of air in the sewage would render it almost odourless. Mr. Geo. Fuller said that oxygen seemed to be an antidote for sulphuretted hydrogen. It was a long time since Waring and other Americans first advocated the introduction of air into sewage as an element of purification, and they must all agree that many benefits could accrue from [illegible] sewage, provided that it could be done at reasonable cost. Whether the air should be introduced before it was distributed over the bacteria beds or introduced at an earlier stage he did not suggest; but it must not be forgotten that temperature, velocity of the wind, electrical disturbances, and so forth, all played a part in the matter.

AIR BLOWN SEWAGE.

After all, however, the preponderant difficulty was the presence in the sewage of sulphuretted hydrogen and the cost of eliminating it. With a view to getting some definite information on these points he began six months ago to make some experiments, but they had not yet been completed. He might say, generally, however, that they seemed to point to the fact that the object could be attained by a system of air blowing at a cost of not less than 27s. per 1,000,000 gallons treated. The experiments included air blowing at various pressures and under varying conditions. The sewage before and after blowing was tested for absorbed oxygen in accordance with the Royal Commission method.

Experiment No. 1 was on a 15-in. pipe, 36 ft. long, fitted with eight rings equally spaced, in which were $\frac{1}{8}$-in holes, through which the air was introduced. Experiment No. 2 was the introduction of air into an 18-in. rising main. Experiment No. 3 was with a 2-in. vertical pipe into which was introduced a single air hole, and No. 4 with a hydro machine.

As a general statement he must say that the results obtained by Nos. 1 and 2 experiments were very erratic and inconclusive. In No. 3 complete saturation was obtained in several cases; but in all cases where complete saturation was obtained there was 30 per cent saturation in the sewage itself. In No. 4 they had various rates of speed. Saturation varied from 50 to 90 per cent, and they found that the higher the speed the better the results obtained; but it was not easy to obtain a 60 per cent saturation from speeds of 300 to 400 revolutions per minute. They obtained their best result of 92 per cent saturation at 540 revolutions. The air was supplied by an air compressor worked electrically.

Taking the cost of electric power at $\frac{1}{4}$d. per unit, which was cheap, the cost of fairly complete saturation worked out at $\frac{1}{2}$d. per 1,000 gallons. He was anxious to find out whether it would be possible to aërate the whole of the Birmingham sewage, after it had arrived at the outfall works, at anything like a reasonable cost. The whole of the experiments were going on, and he felt that in speaking of them at this stage he was acting unwisely. His wish was to induce those who had the opportunity to make similar experiments to do so, for there was a great deal of work to do before any definite recommendation could be made.

(To be continued.)

The Tunnel Cement Works.—A party of members of the Junior Institution of Engineers paid a visit last Saturday afternoon to the Tunnel Cement Works, Purfleet. The party were shown round the chalk quarry, and the mills in which the chalk and clay are washed and ground to the thick slurry from which the cement clinker is made. They afterwards witnessed the burning of the clinker in two large rotary kilns, each 210 ft. long, saw the mills for grinding of coal dust, and how the firing of this dust takes place in the kiln; the cement mill in which the cement clinker is ground, the cement stores where the cement is packed by means of patent dustless vacuum packers, exilors, and, finally, the absolutely up-to-date power station, with water-tube boilers and turbo-generators.

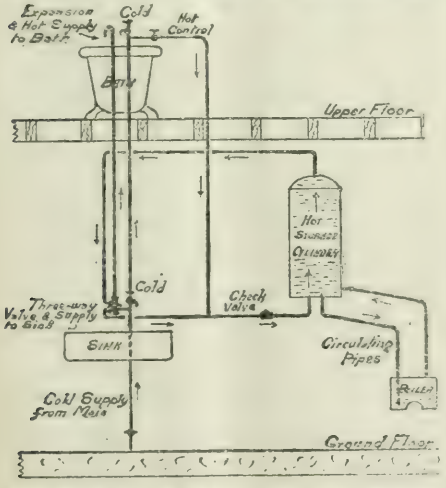
Sir, though I would persuade, I'll not constrain;
Each man's opinion freely is his own
Concerning anything, or anybody.

—MASSINGER: "The Fatal Dowry," Act ii., 2.

THE ECONOMICAL SUPPLY OF HOT WATER TO ARTISANS' DWELLINGS.

To the Editor of THE SURVEYOR.

SIR,—The extract from a paper by MR. HENRY BURRIDGE, in last week's SURVEYOR, relating to this subject, is most interesting, and the method he describes has undoubted advantages under particular circumstances. It would appear, from the description given, however, that *only the bath* can be supplied with a "hot" tap from the apparatus, and



even this useful, if not ornamental, acquisition has to be fixed *either in the scullery, or the kitchen* to be so supplied—that is, the bath must be at a level below that of the water in the combination range and copper. The sink, being above this level, obviously is precluded from the luxury of a "hot" tap.

Experience in the provision of proper housing for workers (and I venture to think we at Letchworth may claim to have had a moderate share of such experience) goes to show that artisans who can afford to pay the just and fair rates recently required and rightly enforced by something more than a mere cold supply to a bath fixed in the scullery. And so it occurred to me on reading the extract above mentioned that many of your readers, including Mr. Burridge, would perhaps be glad to know of a well-tried, simple, and inexpensive method whereby hot water can be supplied to bath *and* sink, and, moreover, allows of the bath being fixed either up or down stairs.

This particular system, which, I may add, has been in use for several years, and is installed in some 200 cottages, at Letchworth and elsewhere, resembles the usual domestic hot water supply apparatus so far as kitchen boiler, cylinder and circulating pipes are concerned; but no cold tank in the roof is required, with its usual pipes, ball valve, &c. The cold supply as in the system described by Mr. Burridge, comes direct from the mains, the principle employed being that of displacement of the hot water contained in the cylinder by cold water under pressure.

The hot supply pipe is taken from top of cylinder to the sink, where it is connected to a special "three-way" valve, and continues on from this to the bath, where it terminates with an open end which acts as a combined supply to bath and expansion pipe. A "check-valve" is placed on the cold supply pipe to the apparatus, and a "hot control" tap at bath, and sink, for turning on the "main" supply to cylinder.

The system is operated as follows: When hot water is required at the bath all that is necessary is to turn on "hot control" tap. To obtain hot water at sink, the "hot control" at that point is turned on, which operates at the same time the lever of the three-way valve, closing the way to bath and opening that to sink. Directly the "hot control" at sink is turned off the way to bath is automatically opened again, the three-way valve being so constructed that it is impossible to have the ways to sink and bath both closed at the same moment.

The cost of an installation on these lines, including fixing, &c., varies from £4 10s. to £5 10s., according to local conditions and the distance of kitchen fire from the points of delivery. Reference to the accompanying diagram will assist in making clear the various details mentioned. Bath and sink are not, of course, included in the costs given.

The advantages of this system were referred to recently by Mr. Maurice B. Adams, A.R.I.B.A., in his lecture on "Cottage Housing" at Carpenters Hall. It is also described in C. B. Purdom's book, "The Garden City."—Yours, &c.,

S. H. DONNELLY, A.M.I.M.E.

Letchworth.
July 21, 1914

QUALIFICATIONS.

To the Editor of THE SURVEYOR.

SIR,—I beg to appeal to non-members of the Institution of Civil Engineers to ignore the restrictions mentioned in the advertisements for the borough surveyorships of St. Annes and Guildford and to send in their applications without hesitation.

Only by such action can it be forcibly shown that the Institution of Civil Engineers does not include all the best qualified men for such appointments.

Councils must be made aware that there are other equally good if not better and more suitable and practical qualifications than that of membership of this body. By acting on the lines I suggest comparisons may be drawn, and possibly a non-member may be chosen.

How many Assoc.M.Inst.C.E. candidates stood the test and were in the selected for Bridlington, where the salary was higher than that offered at St. Annes? For what reason should they now be specially earmarked for the latter place? Are these consolation appointments?

Personally, though a non-member, and without any local influence, I am applying, and look to my qualifications and experience being beaten by a better man, though perhaps not an A.M.I.C.E. May the best win always!—Yours, &c.,

MUNICIPAL ENGINEER.

July 18, 1914.

IMPROVEMENT OF SEWAGE FARM LAND.

To the Editor of THE SURVEYOR.

SIR,—In a paragraph appearing under the heading "Things One Would Like to Know," in your issue

of July 10th, it is asked if the clay soil of a sewage farm can be improved by digging house refuse into it, and how long it takes to effect the change. In reply thereto, acting under the advice of Mr. H. Percy Boulnois, consulting engineer to my council, in August last I commenced digging house refuse into the chalk and breccias at Alton sewage work. The first section treated was not a complete success, the refuse being put in deeper than was intended. The remaining part of the ground has been treated to a less extent, and a crop of oats duly harvested, which has given excellent results, and have since been treated a second time. In this period—not yet a year—the soil is being transformed from a marl to a loam. I may add I have seen ashes and house refuse ploughed into hop land of similar character, but in this case the combination between calcium, alumina and carbon does not appear to be effected so quickly as on sewage land.—Yours, &c.,

G. BERTRAM HARTLEY.

Town Hall.
Alton, Hants.
July 18, 1914.

STREET NUISANCES.

To the Editor of THE SURVEYOR

SIR,—In your editorial of last week you referred to a suggestion made by me in 1908 as to the nuisance caused by dogs in urban districts, and also as to preventing the depositing of sweepings on public thoroughfares and dealing with spitting. I am glad to see that after the idea has been germinating for six years it has at last burst through the husk of human apathy, and in time, if properly tended, may bring forth "rare and refreshing" fruit.

It would be interesting to have suggestions from the readers of THE SURVEYOR as to a by-law or by-laws to control these matters, and how such by-laws can be enforced. I am prepared to make a suggestion, but prefer to give the opportunity to other and better tillers in the garden of sanitary science before placing before the lovers of decency and order a drastic, but effective, form of pruning knife.—Yours, &c.,

REGINALD BROWN,
M.INST.C.E., M.I.MECH.E., F.S.I., &c.

Southall.
July 18, 1914.

NEW WESTERN ROAD.

THE TAX ON MOTOR OMNIBUSES.

The Middlesex County Council (Western Road and Improvements and Finance) Bill was read a third time and passed in the House of Lords on Monday.

Lord Montagu of Beaulieu moved the omission of the clause requiring motor omnibus companies to contribute ¾d. per car-mile towards the cost of the upkeep of the road. He said he considered that if the question were dealt with at all it should be dealt with by general and not by piecemeal legislation. The Road Board, who had given £400,000 towards the estimated cost of the new road, did not anticipate that there would not be a general user of the road, and a curious anomaly was that there was to be no charge for traction engines and heavy lorries with steel-tyred wheels.

The Duke of Bedford justified the imposition of the charge, and pointed out that in contrast to the heavy charges imposed on tramway companies the motor omnibus companies only had to obtain licences for their vehicles and they could run anywhere without contributing anything towards the maintenance of the roads.

Viscount Peel remarked that, while he felt the principle was a dangerous one, he supported the clause as a protest against the way in which the 'buses were allowed freely over the whole country.

Earl Russell asked where they were to stop once the principle of dividing up roads where they crossed the boundaries of a local authority was admitted.

Lord Strachie (Paymaster-General) considered that the matter should be hung up until the question could be considered as a whole.

Finally the amendment was withdrawn, and the Bill was read a third time and passed, as stated.

Northants and East Midlands Surveyors' Association.—A report of a recent visit of this body to Peterborough is unavoidably held over until next week.

OXIDATION OF SEWAGE WITHOUT THE AID OF FILTERS.

MESSRS. ARDERN'S AND LOCKETT'S EXPERIMENTS.

We have been favoured with a copy of a reprint of the paper entitled "Experiments on the Oxidation of Sewage without the Aid of Filters," which Messrs. Edward Ardern, M.Sc., and William T. Lockett, M.Sc., read at a meeting of the Manchester Section of the Society of Chemical Industry in April last. An abstract of the paper appeared in our issue of April 10th (p. 610), and now give the authors' summary and conclusions in regard to their investigations. Messrs. Ardern and Lockett state that their investigations have established:

(1) That the resultant solid matter obtained by prolonged aeration of sewage, which has been termed activated sludge, has the property of enormously increasing the purification effected by simple aëration of sewage, or, in other words, it greatly intensifies the oxidation process.

(2) The extent of the accelerating effect depends upon the intimate manner in which the activated sludge is brought into contact with, and upon its proportion to, the sewage treated.

(3) That, in order to maintain the sludge at its highest efficiency, it is necessary that there should not be at any time an accumulation of unoxidised sewage solids.

It is not necessary that the sewage should be kept in contact with the activated sludge until such conditions obtain, as its activity may be maintained by suitable aëration of the activated sludge alone.

(4) That temperature exerts a considerable influence on the oxidation process. The purification effected is seriously diminished at temperatures constantly below 10 deg. Cent. Up to 20–24 deg. Cent. no material difference in the clarification effect and general purification has been observed, although the nitrification change proceeds more rapidly as the temperature rises. At higher temperatures the clarification effect is somewhat interfered with during the earlier period of aëration, with a consequent delay in the establishment of nitrification. Subsequently the rate of nitrification somewhat increases.

(5) That, under the conditions of experiment, a well-oxidised effluent can be obtained by the aëration of average strength Manchester sewage in contact with activated sludge for a period of from six to nine hours. The percentage purification effected as measured by the usual tests is at least equal to that obtained by the treatment of sewage on efficient bacterial filters. The period of aëration naturally depends upon the strength of the sewage treated and the degree of purification required.

(6) That the activated sludge differs very considerably in character and composition from ordinary sewage sludge. It is in a well-oxidised condition, and consequently entirely innocuous, can be readily drained on straining filters, and possesses a high nitrogen content.

The scope of this inquiry has been up to the present largely confined to laboratory investigations, and while the results obtained have shown conclusively that the purification process can be readily maintained, a large amount of further research is required in order to obtain a thorough knowledge of the character and mechanism of the changes taking place, which will be essential for the efficient control of the process.

The method employed in producing a satisfactory purification of sewage is, however, of so simple a nature that there would not appear to be any insuperable difficulties in translating the experiments described on to a working scale.

In view of the obviously great reduction in the area of works required and capital expenditure involved, the available data in regard to the probable cost of aëration is such as to lend encouragement to the idea that the adoption of aëration methods on the lines of these experiments would result in a considerable reduction in the total cost of sewage purification. In this connection it may be reasonably anticipated that the enhanced value of the resultant sludge should at least cover all costs incidental to its disposal.

Rubber Paving in the City of London.—Permission has been granted by the City of London Corporation to the acting agent of the Federated Malay States Government to lay an experimental strip of rubber paving in Cannon-street.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride lane, Fleetstreet, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

QUESTIONS.

Our readers are invited to the following questions.

409. Road Construction.—Give a specification for the construction of a macadam into a granite setts paved road suitable for heavy commercial traffic. (Urban.)

410. Removal of Sand Bar.—A certain stream carries its barges into the sea has become silted up, and shoaled at its mouth by the formation of a sand bank 100 yds. by 50 yds. by 3 yds. What steps should be taken to prevent a nuisance, and to insure that the stream will be self-cleansing by the action of the tides? (C. Stolidus.)

411. Foundations for Chimney Shaft.—What calculations are necessary for finding the width and depth of concrete for the foundation of a square furnace chimney shaft, 150 ft. in height, on a gravel soil, and built in accordance with the London Building Act, 1894? (Student.)

412. Marine Surveying. Describe a method for obtaining the direction and velocity of tidal currents.

413. Applied Mechanics.—Sketch and describe a Prony brake, and state for what purpose and how it is used.

414. Strength of Materials.—Prove the formulæ $\frac{M}{I} = \frac{f}{y}$ and $\frac{M}{EI} = \frac{1}{r}$ with respect to beams, and explain the meaning of the symbols used.

REPLIES TO QUESTIONS.

405. Disinfection.—Sketch and describe a form of steam disinfector suitable for use in a town of 30,000 inhabitants.

Figs. 1 and 2 give an elevation and plan of a high-pressure steam disinfector, which has been found very effectual in actual practice. It is a type which has been extensively supplied by Manlove, Alliott & Co., Limited, of Nottingham.

Steam at a high pressure is supplied from a 4-h.p. boiler of the vertical type. It enters the steam separator as shown, thus ensuring that the steam

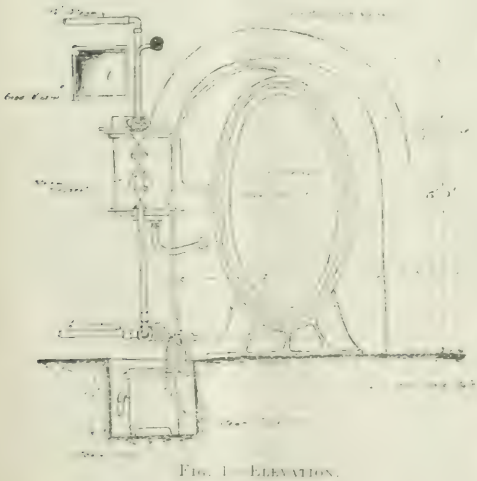


FIG. 1.—ELEVATION.

shall be perfectly dry when it enters the disinfector. The steam is then circulated around the disinfector in a coil of pipes, and leaves at the base by means of the 1½-in. exhaust pipe.

The infected goods are placed on specially constructed stands on one side of the disinfector, and these are then closed in it. The two sliding doors, each having a wheel fitted to it which runs on the steel runners as shown, are then securely stationed on the other side of the partition wall.

Steam is circulated for about ten minutes or more closed, and steam is admitted by the attendant (according to the condition of the infected goods),

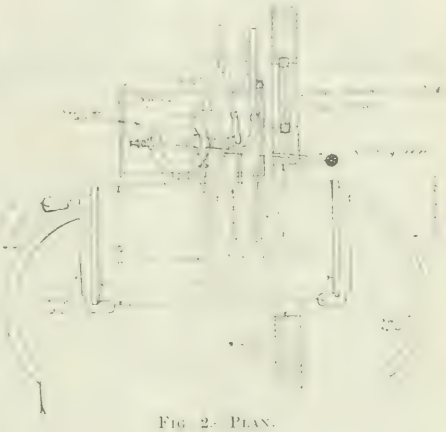

FIG. 2.—PLAN.

after which the supply is cut off, and the goods removed and hung up for drying.

After the disinfector has been fixed in position the space between the arch and the disinfector must be filled in with brick, and a layer of felt placed between the disinfector and the brickwork.

It will be noted that the disinfector is elliptical in section. It is of cast iron, and is firmly secured to a cast-iron base-plate which is strengthened by webs cast on it.

A wood (but preferably iron) cover should be fitted to the steam trap inspection pit, which is formed below the ground level of the building as shown.

A fixed inspection window is placed as shown, and the walls of the building should be of white glazed brick (internally), all corners being rounded off.

The general arrangement, together with the steam-pipe connections, reducing valves, &c., will be quite clear from the sketches. (F. W. P., *Bexhill-on-Sea.*)

407. Surveying.—Describe a method of setting out circular curves by means of offsets. (M.C.E.)

Let AB and MN be two tangential portions of a roadway, which it is desired to unite by means of a curve of, say, 1,000-ft. radius.

A common method of procedure is as follows:—

Select a suitable chord as a basis for the calculation of the offsets—say, 50 ft. in the present instance.

The first offset $= \frac{(\text{Chord})^2}{2 \text{ Radius}}$, and succeeding offsets = twice first offset.

Then first offset in present case $= \frac{(50)^2}{2 \times 1000} = \frac{2500}{2000}$ = 1·25 ft., or 1 ft. 3 in.

Produce AB to C, making BC = 50 ft. From C measure off at right-angles to BC a distance CD = 1 ft. 3 in., which will give the first point in the curve. Produce BD to E, making DE = 50 ft., and from E measure off, at right-angles to DE, a distance EF = twice first offset—*i.e.*, = 2 ft. 6 in.—which will give the second point in the curve. This last operation must be repeated until the point L is reached, at which point the first offset—*i.e.*, 1 ft. 3 in.—must be again used in order that the curve may unite properly with the succeeding tangential portion MN.

The effects in the above figure have been exaggerated for the sake of clearness.

Under method is open to the objection that an [illegible] in the laying off of one of the offset

[illegible] to the succeeding ones. Great care is therefore necessary in laying out the lines, and it is advisable to adjust the curve once or twice to [illegible] as accurate as possible. (W. A. Wilson.)

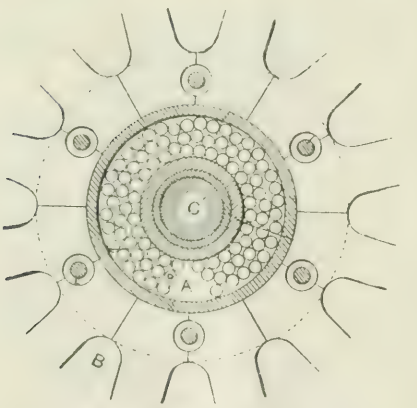
ROAD DAMAGE BY MOTOR 'BUSES AND OTHER VEHICLES.

A RADICAL REMEDY PROVIDED.

[illegible]

The Chancellor of the Exchequer (Mr. Herbert Samuel), President of the Local Government Board, at the annual conference of the Urban District Councils Association, gives to the statement that the larger public companies and the users of motor vehicles generally throughout the United Kingdom cause for very serious reflection. Mr. Samuel made it quite clear that in future they would require to contribute to the cost of maintaining the roads they use, hitherto generously provided for them free of cost by the utterly overburdened ratepayer. He also stated that the weight of vehicles and all other relative matters would now receive the attention of the technical committee to be appointed for the purpose.

By a decision, last week, of the House of Lords, the principle has been adopted that in future motor-



The "Shock-shifter" Hub.

A Hub loosely filled with steel balls. B Spoke communicating road shock. C The axle. D Point of impact of road shock on steel balls which absorb shock and are forced across vacant space A.

(Space A is exaggerated to illustrate the involved principle.)

'bus companies, at any rate, must pay for road maintenance. A moderate charge upon them of ¾d. per car-mile has been legalised in the Middlesex County Council's Bill. This, it is stated, would absorb some 80 per cent of the present motor-'bus profits. In Lancashire the opinion expressed is that 3d. per car-mile would be a moderate charge on motor 'buses for the damage they do on country roads in that county.

Although clamorous complaint of the destruction of roads everywhere has gone on with increasing momentum ever since the advent of motor traction, it has been little heeded by the road users, who have borne their neighbours' misfortune with "Christian-like fortitude." The past treatment of this important subject again illustrates our national trait of character to ignore trouble even if it does eat into our resources till it sits down permanently upon our doorstep, and demands costly and urgent attention. "What is everybody's business is nobody's business" till it touches everybody's tender spot—their pocket.

This national problem has now emphatically done so, and it has become quite clear that it must now be dealt with radically and soundly by Parliament, and that, too, as much in the interest of the road user as the road maintainer.

The Chancellor of the Exchequer last February gave voice to the wails of the ratepayers by declaring the treatment given them to be "irritatingly unjust," and that the subject must come immediately within the range of practical politics.

Some road engineers suggest increasing the depth and solidity of the road foundations, but this would mean an enormous capital outlay estimated by some at a minimum, £30,000,000 sterling, while others suggest that to carry out road reform thoroughly on those lines would involve increasing the National Debt by 50 per cent. By the very solidity of this proposed construction, which inevitably must increase reactionary vibration on the vehicle, there would be a still greater cost of maintenance, which, at its present rate, is the greatest drawback to the economic success of the motor industry, and is most seriously retarding its financial success the world throughout. The consensus of opinion among engineers in the United States is that 15 per cent of the total cost of maintenance is due to this cause. Think of it! Nine shillings out of every £1 spent lost thereby! Honestly analysed, aggregate financial loss and disappointment as yet is the accruing result to the community at large from the motor industry in the present stage of its development. Improvement there must be.

Some experts consider than an elastic tar or bituminous carpet have their advantages, but there must ultimately be produced therefrom an irregular surface, aptly described in some cases as "a rough, petrified sea."

The ultimate and profitable solution of the problem must be to remove the dominant cause of road damage. Thought, nevertheless, has been largely concentrated on how to resist it at an ever-increasing and overwhelming cost. True, hundreds of thousands of pounds have been spent on ingenious and costly devices, because every thinker on the subject recognises that the excessive vibrations set up by the hammer-like action of the axle are destructive alike of road and vehicle. Failure, writ large, was the result till a very simple plan was tried of surrounding the axle of vehicles with a fluid steel ring, which consists of loosely packed, superimposed steel balls filling the hub. The weight of the vehicle itself causes centrifugal action among these, making a "clean cut" of vibration, away from the axle, and, strange fact, actually utilising the road shock to a large extent in propulsive effort, as is proved by a saving of 12½ per cent in petrol, 2 per cent in lubricants, over 20 per cent in gear oil, and 6 per cent in grease, certified by the London General Omnibus Company. At the same time the wheel is maintained in true rolling contact on the ground. Mark that important fact. "Whatever reduces shock to the road also reduces the reaction on the road, which is the main cause of road wear," is the dictum of our most eminent practical authority.

Some years' road experience of the device mentioned on the most crucial of all vehicle tests, by the London General Omnibus Company, the largest users of motor traction in the world, resulted in their certificate that it had given "every satisfaction." This was heartily endorsed by the public, who found the comfort of riding such that letters could be satisfactorily written while travelling, and that road tremor, so destructive of their property, was also overcome.

To "shift" the "shock" and relieve the vehicle owner from vibration—the greatest enemy of his financial progress—and from the backs of the ratepayer and taxpayer by reducing cost of road maintenance to them, is the object of this device, which has consequently been named the "Shock Shifter."

The *Times*, commenting upon the invention, says:—

"Road shock is converted into rotary motion, because the power arising from the obstacle itself is actually harnessed to do this work, and as reactionary shock is thus avoided, vibration is successfully overcome."

It is the application for the first time in wheel construction of a sound basic natural law governing the right use of force, the efficacy of which no sound thinker can contest.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Ashton-under-Lyne (July 17th. Mr. A. W. Brightmore.—£14,200 for the improvement of the sewage disposal works.—Mr. J. Rowbottom, of Ashton, engineer of the scheme, gave details of the proposed alterations and improvements, after which the inspector visited the works.

Bath R.D.C. (July 9th. Mr. H. Shelford Bidwell). £3,000 for works of sewerage and sewage disposal.—The Wilts County Council and the Bradford-on-Avon Rural District Council made an application to the inspector during the course of the inquiry that, as the proposed outfall works for Freshford were to be constructed in the county of Wilts, the loans should be given for dealing with the sewage of Limpley Stoke in that county on the same site. Mr. J. E. Willcox explained the scheme, and pointed out there would be no engineering difficulties in according to the request provided suitable terms could be arranged with the Bath Rural District Council. Mr. Whittington, the clerk to the council, informed the inspector that they would be willing to consider the proposal.

Bishop Auckland U.D.C. (July 13th. Mr. R. H. Bicknell). £700 for a bandstand and cowing sheds on the recreation ground. Upon learning that the council had already spent £300 on the works, the inspector declared that there was no justification, except under extraordinary circumstances, for anticipating the sanction of the Local Government Board. The necessary plans were submitted by the surveyor, Mr. T. Collins. The inspector suggested certain alterations to the plans with regard to the public conveniences which would mean an addition of £100 to the amount applied for, and he advised the council, if they agreed, formally to pass a resolution, at the next meeting and send it to the Local Government Board, and the amount would probably be added to the loan.

Bournemouth T.C. (July 15th. Mr. W. O. E. Meade-King). £650 for the construction of a relief sewer through the Portman estate, and £350 for surface water drainage at Moordown. The proposed sewer, it was explained, was intended to relieve the sewer in the lowest part of Parkwood-road, there having been cases of flooding in that district.

Llandudno U.D.C. (July 16th. Mr. H. A. Chapman).—£4,855 for the purpose of a housing scheme.—The deputy surveyor, Mr. W. T. Ward, submitted the plans of the proposed dwellings, and the financial statement showed that at 7s. 3d. a week and 6s. a week for houses with three and two bedrooms respectively the rents would just about cover the cost of the interest on and redemption of the loan, if it were paid off in sixty years.

Warrington T.C. (July 10th. Mr. Edgar Dudley). £1,449 for the purchase of property in connection with the widening of Cockhedge-lane, Knutsford-road and Oliver-street. It was explained that the most important of the proposals was that relating to Knutsford-road, where the traffic had increased enormously, and the corporation had steadily pursued a scheme for the widening of the thoroughfare to a uniform width of 60 ft. Up to the present time they had reached the Bridgwater Canal, where the road suddenly narrowed, and was carried over the canal by a bridge only 26 ft. wide.

APPLICATIONS FOR LOANS.

Bourne U.D.C.—£15,000 for the purchase of the local gasworks.

Branston R.D.C.—£15,689 for the Boultham and Swallowbeck sewage disposal scheme.

Chadderton U.D.C.—£700 for laying out a recreation ground.

Cleethorpes U.D.C.—£10,000 for electrical cables.

East Stow R.D.C.—£1,972 for works of water supply.

Goole R.D.C.—£1,200 for works of water supply.

Langport U.D.C.—£1,700 for the erection of dwellings.

Maidstone T.C. £600 for a site for workmen's dwellings.

Rye T.C. £300 for the extension of the municipal buildings.

Saffron Walden R.D.C.—£6,500 for working-class dwellings.

Skipton U.D.C.—£8,700 for the extension of the sewage disposal works.

Warminster R.D.C.—£2,000 for the Chitterne housing scheme.

Warwick T.C.—£1,000 for improvements at the sewage disposal works.

Widnes T.C.—£300 for the extension of the refuse destructor.

LOANS SANCTIONED.

Barnsley T.C.—£4,000 for stoneware sewerage and surface-water drainage.

Colwyn Bay U.D.C.—£1,600 for the purchase of land for housing purposes.

Dublin T.C.—£80,300 for the electricity undertaking.

Foleshill R.D.C.—£1,067 for street improvement.

Grimsby T.C.—£1,733 for street works.

Fleetwood U.D.C.—£387 for street improvement.

Mansfield T.C. £8,000 for gas mains and meters.

Northam U.D.C. £6,500 for Appledore marine parade, quay, and sewerage scheme.

Paignton U.D.C.—£4,000 for laying out a portion of the foreshore at Preston, and for the erection of seats and shelters thereon, and for £1,600 for conveniences and drainage, the £4,000 to be repaid in twenty years, and the £1,600 in thirty years.

Rochdale T.C.—£12,500 for the purchase of a site for a sanatorium.

Slough U.D.C.—£380 for sewerage works.

Southall-Norwood U.D.C.—£5,561 for the purchase of sites in Western-road and Norwood-road for the erection of workmen's dwellings.

Sowerby U.D.C.—£4,082 for sewerage works.

Winchcombe R.D.C.—£2,000 for housing schemes.

Worcester T.C. £10,300 for a new school.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear in the Buildings—Brighton £22,000, Margate, St. Annes [illegible] Colwyn Bay Wrexham, roads and materials—Barnsley £12,000 Portsmouth £200,000; sewerage and sewage disposal —Branston £15,689; water, gas and electricity—Ashton £6,000. Particulars of other works projected will be found in the Local Government Board Inquiries" page.

BUILDINGS.

Barnsley T.C.—The Hospital Committee have instructed the borough surveyor, Mr. J. H. Taylor, to prepare sketch plans and to make an estimate of the cost of a new isolation ward, also a central heating system for the whole hospital, with the consequential increase of the administrative block.

Blackrock (Co. Dublin) U.D.C.—The council have approved the plans submitted by the electrical engineer for the erection of a generating station, and these are to be forwarded to the Board of Trade.

Blairgowrie T.C.—The Property Committee recommended the council to approve of a scheme of alterations at the public hall at an estimated cost of £2,561.

Bournemouth T.C.—The borough surveyor, Mr. F. W. Lacey, is preparing a report upon the scheme for public baths on land intended for a new recreation ground.

Brighton T.C.—Competitive designs are being invited for carrying out improvements at the Aquarium, at a cost not exceeding £22,000.

Cheltenham T.C.—Certain properties on the Promenade are to be converted into municipal offices, at an estimated cost of £5,574.

Cornwall C.C.—It is proposed to carry out alterations to the laundry at the county asylum, at an estimated cost of £700.

Cramlington U.D.C.—It has been agreed to provide a municipal depot, at an estimated cost of £750.

Galashiels T.C.—A scheme is being considered for the extension of the burgh buildings, and Sir Robert Lorimore has been asked to submit estimates for the work.

Herts C.C.—It has been agreed to purchase 86 acres of land contiguous to the Letchworth estate for the purpose of a sanatorium and hospital.

Margate T.C.—A proposal is being considered for the purchase of property on the sea front for the purpose of municipal offices.

St. Annes-on-Sea U.D.C.—A scheme has been approved for the erection of open-air baths and pavilions on the sea front, at an estimated cost of £5,000.

Stonehaven T.C.—The burgh surveyor has prepared plans for the widening of the bridge at Cowie by 14 ft., at an estimated cost of £700, and the matter has been referred to the Streets and Footpaths Committee for report.

Wellington U.D.C.—The surveyor, Mr. G. Riley, has prepared a plan of a public convenience in Station-road, the cost of which he estimates at £150.

HOUSING AND TOWN PLANNING.

Abersychan U.D.C.—Consideration is being given to a scheme for the erection of fifty additional workmen's dwellings.

Brechin T.C.—The Property Committee have been asked to consider a scheme for converting model lodging-houses into artisans' dwellings, at an estimated cost of £700.

Colwyn Bay U.D.C.—The surveyor, Mr. William Jones, has prepared a housing scheme on garden city lines, which has received the sanction of the Local Government Board. The estimated cost is £20,000.

Coventry T.C.—The accounts of the Housing Committee for the year ended March last show a profit of £29, as compared with a profit of £6 for the previous year.

Dewsbury T.C.—A housing scheme, estimated to cost £24,000, has received the sanction of the General Purposes Committee.

Horsham R.D.C.—Official approval has been given to a housing scheme for Cowfold, which it is proposed to carry out at an estimated cost of £1,000.

Mansfield T.C.—A plot of land in Baum's lane is to be purchased for the purpose of a housing scheme. It is estimated that the street work will cost £425.

Norwich T.C.—The city engineer, Mr. A. E. Collins, has received instructions to prepare plans and specifications for the Starling-road housing scheme for about 115 people.

Southall-Norwood U.D.C. — The surveyor, Mr. Reginald Brown, has prepared a report upon a proposed housing scheme upon, alternatively, one of two parcels of land bounded on the west by Western-road, the south by the Common-road, and the east by the recreation ground. The larger site consists of about 9¼ acres, and the smaller area of about 4¼ acres. Mr. Brown suggests that a scheme should be prepared which provides for various classes—*i.e.*, at different rents and with different accommodation, somewhat proportional to the rent to be charged. The rents, he suggests, should vary from 5s. 6d. to 8s. 6d. per week, the larger number being 7s. 6d. per week. With regard to the accommodation to be provided, he has prepared several sketch plans as follows: Class A, accommodation, living-room, scullery and two bedrooms, suggested rental 5s. 6d. per week; Class B, as A, but slightly larger, 6s.; Class C, living-room, scullery, and three bedrooms, 6s. 6d.; Class D, as C, but slightly larger, 7s.; Class E, parlour, living-room, scullery, and three bedrooms, 7s. 6d.; Class F, as E, but slightly larger, 8s.; Class G, as E, but slightly larger and different plan, 8s.; Class H, as G, but slightly larger, 8s. 6d. Each house, no matter what class, is provided with a bath in addition to the usual conveniences. Mr. Brown, in submitting the report to the council, referred to the valuable assistance he had received from his assistant, Mr. Thomson, in preparing the plans.

Spalding R.D.C.—A letter has been received from the Local Government Board declining to sanction a loan for the erection of working-class dwellings in the parish of Pinchbeck. The loan was refused on the ground that the design was for a too expensive house, and that the drainage scheme was insufficient. The Board asked for revised plans on a more economic basis. They intimated that they were agreed as to the necessity for houses in the parish, and they also approved of the sites selected. It was understood that revised plans would be submitted, but the council took objection to the drainage scheme on the ground that it was unnecessary.

Wrexham R.D.C.—The council have decided to apply for sanction to the borrowing of money for the purpose of acquiring land at Johnstown, and building thereon forty-four houses, estimated to let on an average of 5s. 9d. per week inclusive. The scheme comprehends the erection ultimately of sixty-five houses, at a cost of about £13,000, including land, buildings, street making and sewerage.

PARKS AND OPEN SPACES.

Bushey U.D.C.—The surveyor, Mr. E. E. Ryder, has received instructions to prepare alternative plans for shelters, tennis courts, and fences at the recreation ground.

Darwen T.C.—The disposal of the bequest to the town of £10,000 by Alderman Lightbown was discussed recently, and a resolution was passed requesting the trustees to consider the question of providing playing fields for the borough.

REFUSE COLLECTION AND DISPOSAL.

Greenwich B.C.—The council have appointed a representative on a joint committee of riverside boroughs which is to consider the question of combination for the purpose of the disposal of refuse. The council have also instructed the Highways Committee to consider and report as to the desirability of adopt-

ing the system of dealing with refuse by crushing, now in use at Southwark, Glasgow, Hove, and other places.

ROADS AND MATERIALS.

Argyll C.C.—The surveyor to the Lorn District Committee has received instructions to report upon alternative routes for the proposed road beween Ballachulish and Kinlochleven.

Barmouth T.C.—The council contemplate an extension of the marine parade, at an estimated cost of £2,000.

Cork T.C.—A scheme has been approved for asphalting in Parliament-street, St. Peter's-place, and St. Paul's-place.

Glamorgan C.C.—A letter has been received from the Road Board stating that, subject to certain details being approved by them, they were prepared to contribute £23,000 towards the cost of various main road improvements proposed to be carried out by the county council at an estimated cost of £120,000. The county surveyor, Mr. G. A. Phillips, reports that the average cost of road maintenance per mile, including tar-spraying and watering, amounted to £220 for the year, compared with £223 for the previous year.

Looe U.D.C.—A scheme is under consideration for effecting extensive improvements in the streets.

Newhaven R.D.C.—The surveyor, Mr. Arthur C. Groves, reported that the Seaford-Newhaven road, which had previously been in a very satisfactory condition, was now badly cut up owing to extraordinary traffic, and he advised that the council should consider the question of treating it in a manner to deal with the additional traffic by laying a more solid foundation. The matter was referred to the Highways Committee.

Portsmouth T.C.—A scheme has been approved for a new road out of Portsmouth, at a cost, for works within the borough, of £120,000, and outside the borough of £80,000.

Queen's County C.C.—The council decided recently to appoint an additional assistant surveyor.

SEWERAGE AND SEWAGE DISPOSAL.

Branston R.D.C.—A sewage disposal scheme, estimated to cost £15,689, has been adopted for the eastern part of Boultham and the eastern part of Swallowbeck.

Caerphilly U.D.C.—For the new sewage disposal works an order has been placed for six Adams' patent "Cresset" revolving sprinklers, with Adams-Hydraulics, Limited, of London and York. The engineers for the scheme are Messrs. Willcox & Raikes, of Birmingham, and the contractor Mr. Buckley, of Bradford.

Clown R.D.C.—The surveyor, Mr. J. T. Pears, has received instructions to prepare plans for an improvement at the sewage outfall works.

Foleshill R.D.C.—A sewage disposal scheme for Exhall is to be considered by the council at an early date.

Goole U.D.C.—The tender of Messrs. F. E. Binns & Co., of Croydon, at £10,722, has been accepted for work in connection with the sewerage scheme, and the tender of Messrs. Herbert Morris, of Loughborough, at £122, for the erection of a traveller at the sewage pumping station.

Hemsworth R.D.C.—The tender of Adams-Hydraulics, Limited, has been accepted by the council for the supply and erection of two 100-ft. sprinklers, and other fittings required on the extension to the South Elmsall sewage works, where "Cresset" sprinklers have already been in use for several years with much success.

Higham Ferrers T.C.—The tender of the Ames-Crosta Sanitary Engineering Company, Limited, of Nottingham, has been accepted for the supply of their patent "Simplex" rotary distributors for the new sewage disposal works about to be constructed.

Liversedge U.D.C.—The council at their last meeting accepted the tender of the Ames-Crosta Sanitary Engineering Company, Limited, for the supply of various ironwork in connection with the extensions to their sewage disposal work, which include eight of their well-known patent "Simplex" rotary distributors, each 100 ft. diameter.

Oswestry R.D.C.—The council have instructed Messrs. Berrington, Son & Watney to prepare a scheme for the sewerage and sewage disposal of Ifton Heath and St. Martins.

Portslade U.D.C.—The council have approved the revised estimate of the cost of the surface-water drainage scheme, amounting to £4,000 approximately, and the clerk has been instructed to advertise for tenders.

Sandgate U.D.C.—The council have passed a resolution inviting the Folkestone council to connect their sewerage system with their (the urban council's) outfall, so as to save the construction of two outfalls.

Surbiton U.D.C.—On Monday the council were able to settle the vexed question of the claims made by Messrs. Dick, Kerr & Co., Ltd., with regard to "deferred extras" under Contract No. 3 of the Surbiton sewerage works. Thirty-two items were included in the firm's claim, and they were offered £2,500 in full settlement. This they were unable to accept, but offered to take off all their profit, and to settle for £4,500. Finally they agreed to take £3,500, and on Monday a cheque for that amount was drawn, litigation being thus avoided.

Swansea T.C.—It has been decided to affix sewer ventilators at the docks and near the Cricketers' Hotel, as an experiment.

WATER, GAS, AND ELECTRICITY.

Ashington U.D.C.—The Water Committee recommend the council to proceed to obtain Parliamentary powers to utilise Tosson Springs for a supply of water for the district so soon as the council are assured that such a Bill could be successfully promoted. The cost of the scheme is stated to be approximately £65,000.

Bodmin R.D.C.—The Local Government Board have sanctioned an expenditure of £20 in connection with preliminary investigations with respect to a water supply scheme for North Cornwall.

Carlisle T.C.—The nett profit of the gas undertaking last year was £589, as against £8,608 the previous year. The contributory causes of the falling off were a reduction in the price of gas by 3d. per 1,000 cub. ft., and the increased cost of coal amounting to £2,629.

East Grinstead U.D.C.—The council on Monday decided to apply next December to the Board of Trade for a Provisional Order for the supply of electricity for public and private purposes.

Hammersmith B.C.—It has been agreed to fix the charge for the supply of current to, and maintenance of, electric lamps for public lighting in side streets at the rate of £2 7s. per lamp per annum. It has also been decided to convert seventy gas lamps in various streets from gas to incandescent electric light, at an estimated cost of £227.

Llandudno U.D.C.—The working of the electricity undertaking produced last year a nett profit of £462.

Oswestry R.D.C.—The council have received the sanction of the Local Government Board to the scheme for extending the water supply of Weston Rhyn, and Messrs. Berrington, Son & Watney, of Wolverhampton and Westminster, the consulting engineers to the council, have been instructed to obtain tenders for the carrying out of the work.

Southmolton R.D.C.—The tender of Mr. Peter Govier, of Southmolton, at £269, has been accepted for the construction of filter-beds at Chulmleigh in connection with the water supply.

Withernsea U.D.C.—An agreement has been reached with the Hull Corporation for a supply of water.

MISCELLANEOUS.

Douglas (Isle of Man) T.C.—The Highways Committee are giving consideration to the provision of motor cars for fire purposes.

FOR OTHER ADVERTISEMENTS

See End of Paper.

ASSISTANT (26), A.M.Inst.M. & Cy.E., Cert. R.San.I. Shortly disengaged. Eight years' experience as pupil and assistant in rural districts; two years resident on £20,000 sewerage and sewage disposal works. Surveying, levelling, specifications, quantities, building construction, sewerage, waterworks, highways, &c. Neat draughtsman. Accept small salary in good district.—Box 1,449, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,814)

THE URBAN DISTRICT COUNCIL OF HASLEMERE, SURREY.

HIGHWAYS FOREMAN.

The Urban District Council of Haslemere invite applications from persons not exceeding 40 years of age for the post of Working Highways Foreman.

Candidates must be cyclists and possess a bicycle, and must have had practical experience in road tarring and the construction of highways with tarred macadam. They must also be competent to lay out work and keep time books, and generally supervise the work of construction, repair, and maintenance and watering of highways.

Forms of application and particulars of the appointment can be obtained upon receipt of stamped addressed envelope.

(By order)

A. G. WHITCHER,
Clerk to the Council.

Council Offices,
Haslemere.
July 22, 1914. (1,813)

CHERTSEY RURAL DISTRICT COUNCIL.

BYFLEET AND PYRFORD SEWERAGE.

The above-named Council invite Tenders from responsible Contractors for extensions at their Outfall Works.

The said works comprise construction of Two Circular Bacterial Filters, 80-ft. diameter, containing a total of 2,248 cubic yards of destructor clinker, also a 50,000 Gallon Tank, with all pipes and appurtenances.

Plans and Specifications can be seen at the offices of the Engineers, Messrs. Elliott & Brown, Associate Members Inst.C.E., Queen Buildings, Parliament-street, Nottingham, after the 1st day of August, and copies of the Specification, Bills of Quantities and Form of Tender obtained from them on deposit of Two Guineas (to be returned on receipt of a *bona-fide* Tender not afterwards withdrawn), and return of all documents.

A copy of the printed Specification may be inspected at the office of the Surveyor, Mr. H. Berney, Bailey Lodge, West Byfleet.

Sealed Tenders endorsed "Tender for Filter Beds, &c.," delivered to the undersigned not later than the post on Tuesday, 18th August, 1914.

The lowest or any Tender will not necessarily be accepted.

By order,

H. E. PAINE,
Solicitor and Clerk to the Council.

Chertsey, Surrey.
July 25, 1914. (1,811)

THE RURAL DISTRICT COUNCIL OF RUNCORN.

GRAPPENHALL, LATCHFORD WITHOUT, AND THELWALL SEWERAGE.

The time for receipt of Tenders is extended to Friday, the 21st day of August, 1914.

GEO. F. ASHTON,
Clerk to the Council.

Runcorn.
July 22, 1914. (1,812)

TWICKENHAM URBAN DISTRICT COUNCIL.

MOTOR FIRE ENGINE AND ESCAPE.

The above Council hereby invite Tenders for the Supply and Delivery of a 400-450 gallon Petrol Motor Fire Engine, complete with Pump, 50-ft. Fire Escape and First Aid Equipment.

Further particulars and Form of Tender may be obtained on application at the Office of Mr. Fred. W. Pearce, Engineer and Surveyor to the Council, Town Hall, Twickenham.

Sealed Tenders, endorsed "Tender for Motor Fire Engine," to be delivered to the undersigned not later than noon on Wednesday, the 12th day of August, 1914.

The Council do not bind themselves to accept the lowest or any Tender.

(By order)

H. JASON SAUNDERS,
Clerk to the Council.

Town Hall,
Twickenham.
July 22, 1914. (1,815)

PERSONAL.

Mr. John Lloyd, surveyor to the St. Asaph (Flints) Rural District Council, has received an increase of salary of £10 a year.

Mr. G. Strutt, surveyor to the Dodworth Urban District Council, has been appointed clerk of the works for the new municipal offices scheme.

Mr. D. Mort, surveyor to the Lymm Urban District Council, has been granted clerical assistance owing to the increase of his professional work.

Mr. Herbert Samuel, President of the Local Government Board, has promised to give the inaugural address to the members of the Summer School of Town Planning on Monday evening, August 3rd. The course will be held in the School of Architecture at University College from August 3rd to 15th.

Mr. A. Gladwell, surveyor to the Eton Rural District Council, has been placed on the committee of the Institution of Municipal and County Engineers appointed to prepare and give evidence before the Departmental Committee of the Local Government Board on the question of the working of the building by-laws.

Mr. C. G. Mason, as already announced in these columns, has resigned his position as borough surveyor of Guildford after eighteen years' service. Prior to the appointment of a successor, the work of the department is being carried on by Mr. G. A. Ballard, Assoc.M.Inst.C.E., the assistant borough surveyor, with the help of Mr. O. L. Cole, Stud.Inst.C.E., the second assistant.

Mr. C. O. Baines, surveyor to the Paignton Urban District Council, has, we regret to state, suffered an irreparable loss by the death of his wife. One of Mrs. Baines' last public acts was to entertain at tea in December last the members of the South-Western District of the Institution of Municipal and County Engineers. The Paignton Council have passed a vote of condolence with Mr. Baines, and granted him leave of absence.

Messrs. A. Lupton, engineering assistant to city engineer, Leeds, S. D. Meadows, engineering assistant to borough engineer, Ipswich, and G. A. Waite, engineering assistant to borough surveyor, Rochdale, have been elected associate members, and F. H. G. Stockdale, county surveyor's office, Frome Rural District Council, A. Carstairs, burgh engineer's office, St. Andrews, R. W. H. Vallis, surveyor's office, Frome Rural District Council, E. W. H. Vallis, assistant surveyor, Langport Rural District Council, J. Parkin, town surveyor's office, Buxton, and H. R. Hayes, assistant surveyor to the Southport Water Board, students of the Institution of Municipal and County Engineers.

Lord Headley was on Friday of last week present at the White City, where a gathering of Mohammedans resident in London had been arranged, and there were prayers by the Imam of Woking Mosque, and lectures on Mohammedanism. Saifurrahman Shaikh Rahmahillah Farvoq is the name Lord Headley adopted with his new faith at the end of last year. As Mr. R. G. Allanson-Winn he had a distinguished career as a civil engineer, and was a fine all-round sportsman in his time. When he was up at Cambridge he won the heavy and middle weights, and Jem Mace once said of him, after seeing him spar, that with training he would make one of the finest boxers of the day. He has contributed frequently to The Surveyor, mainly on foreshore protection, on which he is a widely known expert.

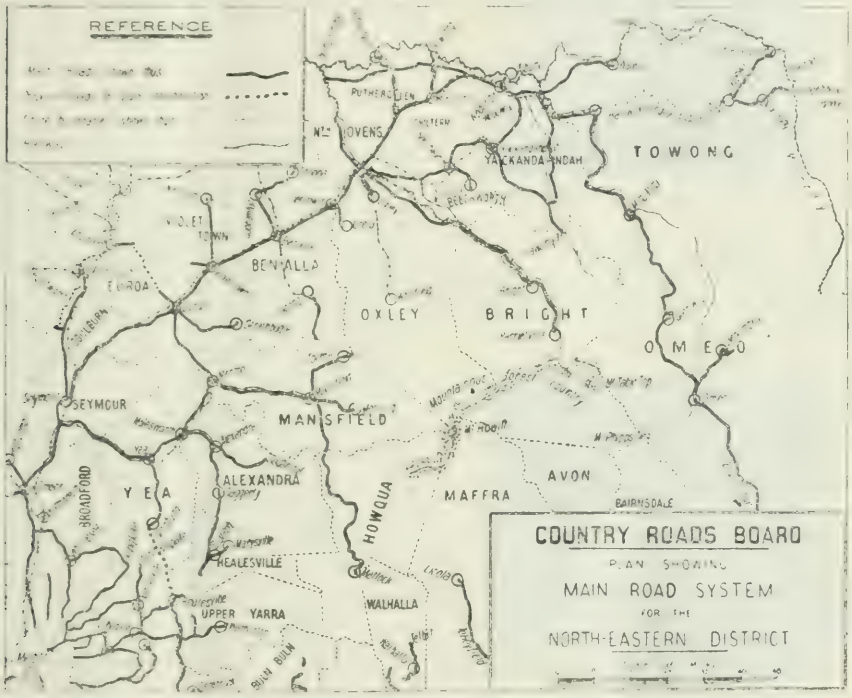
Mr. G. S. Coleman, Assoc.M.Inst.C.E., Manchester, has been successful in obtaining the degree of Doctor of Science in engineering at the University of London. Until last February he was engineering assistant in the city surveyor's office, Manchester. It is believed that he is the first municipal engineer to win this distinction, at any rate by examination, and in a purely municipal subject—namely, the discharging capacity of storm overflows, and the discharge of rain storms in sewers. There are now only four students of the university holding the external degree and two internal, and it is possible that the external degree may be abolished in the near future if the recommendations of the Royal Commission are accepted. Mr. Coleman's thesis was much praised by the examiners, who thought that the results were extremely valuable.

COUNTRY ROADS BOARD OF VICTORIA.

DEVELOPMENT OF NORTH-EASTERN AREA.

[illegible] the accompanying map of the proposed main road [illegible] for the North-Eastern district of Victoria, Australia, which has been prepared by the Country Roads Board, is that State was considered by the State Cabinet on the 4th ult., and was made available for publication by the Minister for Public Works, Mr. Hagelthorne.

It is understood that the proposals of the board for the North-Eastern district will involve an ultimate expenditure of something over £500,000. Speaking with reference to this matter, Mr. Hagelthorne pointed out that fully eighteen months must elapse before the money voted for the work of road construction could be absorbed, by which time any Government which happened to be in power would no doubt recognise the good work the board was doing, and vote whatever further money was necessary to carry on the road development. These districts



which had yet to be visited by the Roads Board would not be prejudiced to any degree by the large expenditure involved in the North-Eastern division.

HEAVY MOTOR TRAFFIC AND ROAD MAINTENANCE.

At the annual meeting of the Urban District Council Association Mr. Herbert Samuel, President of the Local Government Board, in an opening address, made a reference to the regulation of heavy motor traffic and its liability to contribute towards the cost of road maintenance.

Mr. Samuel said the time had clearly come for a review of the situation in regard to heavy motor cars and omnibuses and their contribution to the maintenance of roads. He was appointing a committee, consisting mainly of engineers, to suggest alterations which might be necessary in the regulations of the Local Government Board relating to the weight of the vehicle and the width of the tyre and similar matters. In addition, a Select Committee would be appointed in order to consider the whole position with regard to motor omnibuses and trolley vehicles running in the neighbourhood of great corporations. The question was whether these services should pay to the upkeep of the roads, and, if so, how much. The position was complicated by the fact that, while a corporation, if it came to Parliament for powers to establish omnibus and trolley-vehicle services, could be required by law to contribute in respect of the damage done to the roads, any company or private individual could start such services without any statutory powers, and without having to make any contribution.

Empress Works, Loughborough. From August 3rd to 11th next the works of Messrs. Herbert Morris, Limited, will stop for stock-taking and overhaul of plant. The offices will close for the yearly holiday. A limited number of the staff will be in attendance to deal with urgent matters. Orders for pulley-blocks and other stock articles will be executed from stores as usual.

A Glossary of Road Terms. By H. Percy Boulnois, M.INST.C.E. Price 2s. nett. The St. Bride's Press, Limited, 24 Bride-lane, E.C.—The compiler of this road vocabulary says in his modest introduction: "Someone had to make a start," and it cannot be denied that with the thousand and more words he has collected a very good start has been made. . . Every reader of the glossary will recognise the industry of which proof has been given in its compilation, and due credit will be awarded for the courage and independence shown in the definition of some terms which have hitherto been the subject of much heated discussion.—*Sanitary Record.*

Business Announcement.—Claridge's Patent Asphalte Company, Limited, announce that they have opened an agency in Manchester to cope with the work in the North Midlands District. Their representative is Mr. E. J. Thompson, of 36 Spring Chambers, Manchester.

New Building Regulations for Council Schools.—The Board of Education on Saturday issued new regulations for the planning, erection and fitting up of new elementary schools in England. The new regulations replace those issued in 1907, and the chief changes relate to design as affected by ventilation, to disposition of buildings on the site, to size and organisation of departments, and to extent and character of facilities for physical exercises, play, and organised games, whether for older or younger children.

NEW DEVICE FOR TAR-PAINTING OF ROADS AND FOOTPATHS.

[redacted] Patent Sweeping Co., Ltd., of [redacted] Street, Westminster, have recently introduced a new device for tar-painting roads and footpaths. The invention is the property of Mr. S. [redacted], surveyor to the Middlesex County Council, and is stated

Pail with Distributor on Tar-boiler

to make it possible for the operator having a pitch boiler to tar-paint successfully, and at a very small cost in appliances.

The method of working is very simple. The pail is filled with tar at the proper heat, and the man carrying the pail turns on the tap, which allows the tar to run through the bottom of the pail on to a

Close Flexible Tar-boiler

depositing it in a perfectly even film of a width of 18 in. on to the surface of the road. The man in charge of the pail has simply to walk backwards and forwards, and the tar is delivered so close to the surface of the road that it retains sufficient heat to allow the men who follow immediately behind with brooms easily to brush forward any surplus tar. The saving in [redacted] is stated to be very considerable, and sloppy work is avoided in consequence.

This device may have a continuous feed from the pitch boiler, as shown in the accompanying photographic views, the attachment being made to the tap by means of metallic tubing of sufficient length to allow the distributor to work more than halfway across the road; the other end of the metallic tubing being screwed to the bottom of the pail immediately over the cone. This system applies the tar so quickly that the tar-boiler must be practically kept on the move. The boiler is emptied in a very short time, but while waiting for the heating of further supplies the men who have distributed and brushed the tar can be employed spreading grit on the finished portion.

The accompanying views show how the inventor has adapted a pitch-boiler for use with his inven-

[redacted]. In order to do the filling easily and quickly he has fixed an arm of 2in. steam piping to the boiler, with endless chain blocks attached for lifting purposes.

It will be at once seen that for tar-painting these pails supply a long-felt want, the evenness of the tar making them ideal for the purpose.

We are informed that the whole system will be found very economical both with regard to material and labour, and that the makers, will be glad to give further particulars and prices on application.

SOME RECENT PUBLICATIONS.*

Hydraulic Diagrams. Third Edition. By Prof. C. W. L. Alexander, M.Sc., A.C. Price 2s. 6d. nett. Post free from the Author, University College, Cork.

The objects of these charts is to solve all kinds of problems on the flow of water in pipes, sewers, rivers and channels, and over weirs. The method of using them is fully explained by the examples worked out on the folder facing the diagrams. With them questions on compound mains, distribution systems, and drainage plans are simple. The charts have been produced with every regard to convenience in use. Thus, they are printed on handmade paper, the toughest and best material obtainable for this purpose. In mounting them in the cover care has been taken to allow of them being removed therefrom and mounted on cardboard for office use. Further the charts are so drawn that the sheet may be cut into four and the parts mounted separately. No lines have been thickened, in order that engineers may rule up in red ink those lines which they find of most importance in their own special work. The present edition goes much further than its predecessors, inasmuch as it comprises separate charts for water mains, sewers, rivers and large channels, and weirs, respectively. The work is highly recommended by many leading engineers, and as a means of saving labour in calculation leaves nothing to be desired.

Notes on the Valuation of Real Property. By H. G. Lamputt. Price 1s. 6d. nett. London: Crosby, Lockwood & Son.

This little book contains a brief account in summary form of the principles and practice of valuation. It is intended for candidates taking the intermediate examinations of the Auctioneers' and Surveyors' Institutions. Its forty-five pages comprise eight chapters and four appendices, and the subjects dealt with include Principles of Valuation, Valuation of Freehold House Properties, Leasehold Properties, Premiums, Reversions, Outgoings, Valuations of Buildings, and Valuation of Life Interests. The work consists largely of a series of short, practical examples, and as a first or introductory book for young students has much to recommend it. We may say, however, what is obvious, that an adequate and sound knowledge of the subject, even for examination purposes, cannot be gained without supplementing this book by one of the larger and more elaborate treatises.

Scales for Ascertaining the Dimensions of Pipes, Drains and Sewers. By C. E. Housden. Price 1s. 6d. nett. London: Longmans, Green & Co.

These scales are taken from the author's work on "Water Supply and Drainage Systematised and Simplified," and enable the user readily to ascertain the dimensions, to the nearest inch, of pipes, of half-pipes, and of any design of drain or sewer in which a semi-circle or circle can be inscribed. The use of the scales is simple and direct, and although reference must be made to the larger work for an exposition of their construction, the method of using them is clearly explained at the beginning of the present work. The use of the fancy words "galmins" and "cusecs" for "gallons per minute" and "cubic feet per second" is a little puzzling, however, until the intelligent reader hits upon their meaning.

Hydraulics. By E. H. Sprague, Assoc.M.Inst.C.E. Price 3s. 6d. nett. London: Scott, Greenwood & Son.

This little book has been compiled chiefly from the author's lecture notes. It comprises the prin-

Buildings.

HEMEL HEMPSTEAD.—July 27th.—For the erection of fourteen cottages, for the rural district council.—Mr. T. H. Lightbody, surveyor, 20 Marlowes, Hemel Hempstead.

MARCH.—July 27th.—For the erection of sixteen workmen's dwellings, for the urban district council.—Mr. W. Fovargue, architect, The Causeway, March.

ERITH.—July 27th.—For the erection of a school, for the urban district council.—The Surveyor.

NOTTINGHAM.—July 27th.—For erecting water-closets and wash-houses, for the corporation.—Mr. A. Dale, city architect, Guildhall.

BROMLEY (Kent).—July 27th—August 27th.—For the enlargement of a hospital, for the Joint Hospital Board.—Mr. J. Ladds, architect, 93 Pemberton-road, Harringay, N.

WOLVERHAMPTON.—July 27th.—For the erection of cottages and stables, for the corporation.—Mr. G. Green, borough engineer.

GLAMORGAN.—July 27th.—For building new schools and alterations to existing schools, for the county council.—County Hall, Cardiff.

DONCASTER.—July 27th.—For school extension, for the Education Committee.—Borough Surveyor.

ERITH.—July 27th.—For the erection of a school, for the urban district council.—The Surveyor, Council Offices, Erith.

LEYTON.—July 28th.—For the erection of offices, for the urban district council.—Mr. E. H. Essex, surveyor.

BRIDGWATER.—July 28th.—For the erection of four cottages, for the rural district council.—Mr. W. A. Collins, surveyor.

WEST SUSSEX.—July 28th.—For alterations and additions to a school, for the county council.—Mr. H. P. Roberts, architect, Thurloe House, High-street, Worthing.

BROMLEY (Kent).—July 28th.—For the erection of a shelter, for the corporation.—Borough Engineer.

SEATON DELAVAL.—July 28th.—For the erection of a public shelter and urinal, for the urban district council.—The Surveyor.

MANCHESTER.—July 28th.—For the erection of tramway offices and public conveniences, for the Tramways Committee.—Mr. J. M. McElroy, general manager, 55 Piccadilly, Manchester.

IPSWICH.—July 30th.—For the erection of two transformer substations, for the corporation.—Mr. J. R. Mead, borough engineer and surveyor.

GRIMSBY.—July 30th.—For the erection of a battery-room, workshop, and lightkeeper's watchroom, for the corporation.—Mr. W. A. Vignoles, Electrical Works.

SEDBERGH.—July 30th.—For the erection of twelve cottages, for the rural district council.—Mr. J. Stalker, architect, Kendal.

SHEFFIELD.—July 30th.—For the erection of district baths and central laundry, for the corporation.

WEDNESBURY.—July 31st.—For the erection of an electricity building, for the corporation.—Mr. E. M. Scott, borough engineer and surveyor.

BRIGHTON.—July 31st.—For alterations and additions to a school, for the Education Committee.—Messrs. T. Simpson & Son, surveyors, 16 Ship-street, Brighton.

ESSEX.—July 31st.—For alterations and additions to schools, for the Education Committee.—Mr. F. H. Bright, clerk, 53 High-street, Maldon.

CRAMLINGTON.—July 31st—August 5th.—For the erection of stables and cart shed, for the urban district council.—Mr. W. J. Coulson, surveyor.

RAMSEY.—August 1st.—For the erection of twelve cottages, for the urban district council.—Mr. P. S. Bennett, surveyor.

BROMLEY.—August 1st.—For the erection of eight cottages, for the rural district council.—Messrs. Potter & Harvey, architects, 49 London-road, Sevenoaks.

WANTAGE.—August 3rd.—For the construction of six workmen's dwellings in three pairs, together with the construction of a sewer, house and surface-water drains, sinking a well, and erection of fencing, for the rural district council.—Mr. John W. Harris, engineer and surveyor.

STOCKPORT.—August 4th.—For the erection of shelters, bowling houses, and tennis pavilions, for the corporation.—Mr. J. Atkinson, borough surveyor.

WEYMOUTH.—August 4th.—For the erection of twenty-three cottages, for the corporation.—Mr. S. H. Jackson, architect, Bridge Chambers, St. Thomas-street, Weymouth.

HUDDERSFIELD.—August 4th.—For the erection of a public convenience, for the corporation. Town Clerk.

STANLEY.—August 4th.—For the erection of an underground convenience and storehouse, for the urban district council.—The Surveyor.

AYLESBURY.—August 5th.—For building a generating station, for the urban district council.—Messrs. Kincaid, Waller, Manville & Dawson, St. Stephen's House, Victoria Embankment, Westminster, S.W.

EAST GRINSTEAD.—August 5th.—For widening a culvert, for the rural district council.—Mr. C. Turton, surveyor.

GLASGOW.—August 10th.—For masons' and concrete work for the proposed approach to art galleries, for the corporation.—Office of Public Works, 64 Cochrane-street.

LITTLEHAMPTON.—August 12th.—For the erection of a public lavatory, for the rural district council.—Mr. H. Howard, surveyor, Town Offices.

HERTS.—August 20th.—For the erection and completion of a new special subjects centre at Stevenage, for the county council.—Mr. Urban A. Smith, county surveyor, Hatfield.

GRANTHAM.—For the erection of two cottages, for the corporation.—Borough Surveyor, Guildhall.

Iron and Steel.

TENDRING.—July 27th.—For the supply of 2,190 yds. of 3-in. cast-iron water main, for the rural district council.—Mr. S. Francis, engineer, Town Hall Buildings, Clacton.

MANSFIELD.—July 28th.—For 4 miles of gas mains, for the corporation.—Mr. W. J. Rendell-Baker, gas engineer and manager.

Roads.

WHITCHURCH.—July 27th.—For steam rolling, for the rural district council.—Mr. J. T. P. Clarke, clerk.

WINCHESTER.—July 27th.—For asphalt macadamising work, for the corporation. Borough Engineer

WIGAN.—July 27th.—For paving portions of Chapel-lane and Poolstock with granite setts, for the corporation.—Mr. A. T. Gooseman, borough engineer, King-street.

BRAINTREE.—July 27th.—For the supply of 700 tons of broken granite and the use of a steam roller, for the urban district council.—Mr. H. H. Nankivell, surveyor.

BECKENHAM.—July 27th.—For the supply and delivery to Bromley South Railway Station (L.C. and D.R. of 100 tons of 1½ in. granite ring for the urban district council.—Mr. John A. Angell, surveyor.

LUTON.—July 27th.—For the supply of broken granite and slag, for the rural district council.—Mr. H. Pickering, surveyor.

WATFORD.—July 28th.—For making up certain roads, for the urban district council.—Mr. D. Waterhouse, engineer.

J. Taylor & Sons, Caxton House, Westminster, S.W.

[illegible]—For sewage disposal works extension, for the urban district council.—Mr. J. E. Aldersley, engineer and surveyor.

GRIMSBY.—August 1st.—For the construction of about 300 yds. of 9-in. sewer and manholes, for the rural district council.—Mr. A. Hobson, engineer and surveyor.

HARROW.—August 1st.—For works of sewerage, for the urban district council.—Mr. J. P. Bennetts, engineer and surveyor.

PORTSLADE.—August 4th.—For the construction of main surface-water sewer and outfall works, for the urban district council.—Messrs. Chatterton & Alford, 9 Victoria-street, Westminster, S.W.

RUNCORN.—August 7th.—For the construction of sewers and sewage disposal works, for the rural district council.—Messrs. J. Diggle & Son, 14 Victoria-street, Westminster, S.W., and Hind Hill-street, Heywood, Lancashire.

QUEENSTOWN.—August 7th.—For the construction of an outfall sewer, for the urban district council.—Mr. P. H. McCarthy, engineer, 39 Westmorland-street, Dublin.

RUNCORN.—August 7th.—For laying steel tube, cast-iron and earthenware pipe sewers, flushing tanks, storm overflows, manholes, ventilators, sedimentation tanks, percolating filter (including reinforced concrete construction on the Kahn system), engine and pump-house, pump well, and other appurtenant works, for the rural district council.—Messrs. J. Diggle & Son, 14 Victoria-street, Westminster, S.W., and Hind Hill-street, Heywood, Lancashire.

SOUTHAMPTON.—August 12th.—For the construction of surface-water drains at Cosham, near Portsmouth, for the county council.—Mr. W. J. Taylor, county surveyor, The Castle, Winchester.

FLEET.—August 13th.—For the construction of about 16 miles of stoneware and cast-iron sewers, brick, concrete, and cast-iron manholes, flushing tanks, ventilating shafts and columns, cast-iron rising mains, air mains, engines, compressors, ejectors, and other works incidental thereto, for the urban district council.—Mr. T. J. Moss-Flower, engineer, 28 Victoria-street, Westminster, S.W.

DENTON.—August 15th.—For the construction of twelve new circular percolating filters, together with humus tanks, automatic dividing chambers and other works in connection therewith, for the urban district council.—Mr. J. B. Cooke, engineer and surveyor.

ALEXANDRIA.—December 8th.—For the construction of a sewerage system, for the municipality.—"M. le Président de la Commission Municipale d'Alexandrie," Alexandria.

Preliminary Studies in Bridge Design.—This little book,* a reprint of articles which appeared in THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER, is intended as the first of a series of similar volumes which, taken together, will form a treatise on the design of ordinary highway bridges of moderate spans. This first volume goes further back in the evolution of the bridge than do most treatises, and considers the bridge in its essential elements, that is as the means of providing a crossing for man and beast across a watercourse. The bridge engineer is apt to forget this primary purpose and to consider his bridge merely as a framework or a carrier of stresses. Mr. Ryves, in a refreshingly original manner, has emphasised the necessity for studying natural and economic predispositions, one might say, of the bridge site, with a view toward producing, not the best type of bridge, but the best method of getting the river and the traffic across one another. . . . —*Engineering News*, New York.

TENDERS WANTED.

HERTFORDSHIRE COUNTY COUNCIL.

STEVENAGE COUNTY COUNCIL SCHOOL.

NEW SPECIAL SUBJECTS CENTRE.

The Education Committee are prepared to receive Tenders for the Erection and Completion of a New Special Subjects Centre at Stevenage.

Persons desiring to Tender for the work may see the Drawings, Specification, Agreement, &c., at the County Surveyor's Office, Hatfield, on or after Thursday, 16th July, 1914, between the hours of Ten a.m. and Four p.m., except on Saturdays, when they may be seen from Ten a.m. till Twelve noon.

A copy of the Schedule of Works (Quantities) and a Form of Tender can be obtained at the County Surveyor's Office upon payment of Two Guineas, which sum will be returned to the tenderer upon receipt of a *bonâ-fide* Tender and the documents which have been supplied to him.

Sealed Tenders, endorsed "Tender for New Special Subjects Centre, Stevenage," must be delivered to the undersigned, at his offices, not later than Four p.m. on Thursday, 20th August, 1914.

Such security for the due execution of the works as the Council may require must be given by the Contractor.

The lowest or any Tender will not necessarily be accepted.

URBAN A. SMITH,
County Surveyor.

County Surveyor's Office,
Hatfield.
July 14, 1914. (1,800)

(Continued on p. xxii.)

Vol. XLVI. JULY 31, 1914. No. 1,176.

Minutes of Proceedings.

School Buildings.

It is now some seven years since the Board of Education issued a code of regulations for the guidance of architects in designing school buildings, and so rapid and continuous has been the development in all matters relating to education since that time that it is not surprising that the board have recently decided to revise their requirements. From one point of view the matter is not one which practically concerns the municipal engineer or surveyor, inasmuch as the effect of sec. 3 of the Education (Administrative Provisions) Act, 1911, is generally to exempt from the operation of building by-laws "any new buildings being school premises to be erected, or erected according to plans which are under any regulations relating to the payment of grants required to be, and have been, approved by the Board of Education." On the other hand, however, many municipal surveyors also hold office as architects to local education authorities, and so have a very direct interest in the matter. We make no apology, therefore, for drawing the attention of our readers to the recently issued Building Regulations for Public Elementary Schools. The tendency of modern thought is well reflected in the character of the matters in regard to which the principal changes have been made. These relate to design as affected by ventilation, to disposition of buildings on the site, to size and organisation of departments, and to the extent and character of the facilities for physical exercises, play, and organised games, whether for older or younger children. The new regulations are stated in the prefatory note to be the outcome of discussions which have taken place during the last six years in numerous particular cases between the board's officers and the officers and architects of local education authorities and governing bodies. They thus have behind them the full force of a very considerable practical experience.

It is impossible here to deal at length with the several matters comprised in the regulations, including, as they do, full instructions in regard to all the principles to be observed in planning and fitting up new school buildings. The several chapters into which the regulations are divided treat at length of sites and playgrounds, the general arrangement of the building, accommodation, details of various parts of the building, the teacher's house, ventilation and heating, construction and materials, water supply, and plans and procedure. They are not intended as a code of precise and definite rules, but rather partly as a statement of the principles of school planning upon which the board proceed in criticising the plans submitted to them, and partly as a statement of what the board believe to be the best current practice in the application of those principles. The main object in drafting them has been to facilitate co-operation between central authorities, local authorities and architects in securing the greatest amount of comfort, convenience and suitability which a reasonable expenditure can be made to yield. In this, as in other branches of local administration, the question of finance is of the utmost importance. After all, educational efficiency does not depend entirely, or even mainly, upon expensive buildings. It is evident that improved buildings will be of little value if accompanied by a tendency to check improvements in the qualifications and numbers of the teachers employed, and to restrict expenditure in other necessary directions. The available funds are limited, and in administering them the object to be aimed at is the maximum possible all-round educational efficiency. In securing this result well planned and fitted buildings play no small part, and great responsibilities lie upon the Board of Education and school architects. On the one hand the board must try to secure schools which will yield the greatest possible educational advantage to the rising generation, and in considering educational advantages they do not ignore the effect of beauty of design, material or decoration, on the minds of the children or of their parents whose respect for and belief in education are essential to progress; on the other hand, the board have to take account of the present state of public opinion, whether expressed in Parliament or in the municipal assemblies to whom Parliament has committed responsibility for the local administration of education, and while endeavouring to influence public opinion in the direction which they believe to be beneficial to the nation, they cannot ignore the risk of provoking reaction. In this, as in other departments of administration, some degree of compromise is inevitable.

* * *

London's Electricity Supply.

It seems at least possible that, as an outcome of the report of Messrs. Merz and McLellan to the London County Council, upon which we recently commented, some progress may be made towards finding a solution to

the complicated problem of re-organising the supply of electrical energy to London. The Special Electricity Committee have presented to the council a report recommending the latter to promote a Bill in the next Session of Parliament with a view to establishing a new *regime*, and the matter was to be discussed on Tuesday this week. As had been anticipated, the committee recommend a middle course, combining the advantages of municipal finance and control with those of operation by a private company. A new authority representing the London County Council and other public bodies will hold the purse-strings, a small technical committee will supervise the operations of the company, and the company will carry on the business on commercial lines. The bulk of the capital will be provided by the public authority, which also will take the lion's share of the profits; existing undertakings will be acquired by agreement, if possible, without resorting to compulsory powers—the council has the right to purchase them in any event in 1931—and the company may be composed of representatives of the existing companies. If the latter, however, refuse to come to terms the council may call in an outside company. The undertaking will be of immense magnitude, covering an area of 964 square miles, with a population of 7,500,000, and the matter is pressing for attention; for not only is the present system, or rather lack of system, wasteful and expensive, but the companies cannot raise capital for extensions while the situation is unsettled, and financial groups are meditating action with a view to gaining possession of the field if the county council does not occupy it first. It is not proposed, nor would it be necessary, to revolutionise the existing arrangements and co-ordinate the various systems at one stroke; on the contrary, the methods of supply would be unified by degrees with the minimum waste of capital. The extension of existing generating stations in unfavourable situations would be avoided by erecting new stations down the river, from which a bulk supply on the most economical basis would be given to the existing undertakings, and the conversion of the distributing systems to one uniform pressure, current and frequency would be a matter of years. The type of organisation proposed is by no means new, though it has not been adopted previously in this country. All things considered, we think that the scheme put forward by the committee is worthy of serious consideration, and that, although modifications of detail may be desirable, the principle may be accepted as offering good prospects of a satisfactory solution to the problem. The sooner active steps are taken to reform the conditions now obtaining the better, for the greatest city in the world is handicapped by excessive prices for electricity, and a perfectly bewildering medley of systems of supply.

The Removal of Iron from Water.

The removal of iron from water by means of aëration is no new idea, but difficulties are often encountered in the subsequent filtration or settlement required in order to remove the oxide of iron from the water. The successful removal of iron from well water supplied by the Champaign and Urbana Water Company, which was described recently in the *Engineering Record* of New York, provides an interesting example which may be useful under similar conditions. The water contains 2 parts per 1,000,000 of iron, 40 parts of carbonic acid gas, and no dissolved oxygen, and is pumped from a fine sand stratum. Long-standing trouble from crenothrin and stained porcelain led to experiments which proved that the iron could be removed by means of aëration and sand filtration without the use of chemicals. The water is aërated as it falls from the pumping main into a basin. From this basin the water is again pumped into the filters, rising as a jet and falling vertically. It is thus aërated. The filters are ordinary sand filters arranged on the principle of the mechanical filter with air and strainer systems for washing. The filters consist of 30-in. depth of sand and 8 in. of gravel. Each filter, being 12 ft. by 15 ft. in plan, deals with 500,000 gallons a day. After about six weeks of service, the sand grains became so badly coated that the ordinary washing arrangements were found to be inadequate. This difficulty has, however, been overcome by pumping the sand through a centrifugal pump, which cleans it satisfactorily.

It is expected that the process will be perfected to such a degree that the sand of a filter may be washed by running it through a centrifugal pump, and then returning it to its place directly, without using much more water than is required for the ordinary daily wash of the filter. The sand of the beds has been washed in this manner twice in eight months. The occasional use of a fire hose in stirring and washing the sand in the beds has also been found to be effective, the amount of water used being about the same as that required for the ordinary daily wash. Experimental work carried out in order to ascertain whether the application of chemicals to the water would lessen the difficulties of washing has shown no advantage to accrue from this. It is, perhaps, remarkable that for such a purpose as this the fixed spray or rotary sprinkler, similar to those used for sewage filters, is not applied more frequently. It is certain that the aëration would be more perfect; the method would, however, be more applicable to slow sand filter beds than to the rapid mechanical filters. The method of washing the sand at the Urbana works by passing it through a centrifugal pump is certainly interesting, and may have valuable applications.

Public Health of Marylebone.

We have received a copy of the annual report of Dr. Charles Porter, the medical officer of health of St. Marylebone, on the public health and sanitary condition of the borough. In the main this is a satisfactory document. In the first place the rate of infantile mortality, which has been steadily on the decline for some years past, reached in 1913 the lowest point on record. Again, in regard to the duties thrown upon the public health department by Part I. of the Housing, Town Planning, &c., Act, 1909, considerable activity has been shown. The house-to-house inspection enjoined by the Act has been proceeded with, and in those cases where it seemed necessary to do something more than could be called for by the usual nuisance notices the practice has been followed of communicating with the owners before making any report to the Public Health Committee. This procedure has resulted in the execution of much necessary work with a minimum of friction. The list of premises dealt with under the Act is a formidable one, and affords convincing proof of the benefits which the borough is receiving from the powers conferred by it. It is particularly interesting to observe the statement that owners always show themselves to be willing to meet the medical officer of health or the inspector and discuss matters, and that improvements of real value are undoubtedly obtained because the necessity for them and the methods by which they could be brought about are discussed in a friendly way. Another important matter in regard to which the public health department has guarded the public interest is that of nuisances from the emission of black smoke. The

total number of observations of chimneys made by the inspectors was 1,191, and seven nuisances were discovered. A report was submitted to the Public Health Committee at each meeting with regard to the number of observations made and nuisances discovered. In each case in which a nuisance had been detected the owner was communicated with, and any explanation he had to offer was considered by the committee along with the reports of the inspector. In five of the cases the nuisance ceased after the service of intimation notices. In two statutory notices were served; but in no case was it found necessary to issue a summons. The report, of course, deals with many other matters, but enough has been said to show that Dr. Porter and his staff have carried out another year's excellent work for the borough.

Tramways and Town Planning.

The mutual dependence of town planning and cheap, quick means of transport from central to outlying areas is now generally recognised, and it was therefore thoroughly appropriate that Mr. J. A. Brodie, M.INST.C.E., the city engineer of Liverpool, should have taken "Town Planning in Relation to Tramways" as the subject of the paper which he read at the annual congress of the Tramways and Light Railways Association held recently at Newcastle-on-Tyne. Speaking, in the first place, of the absurdly inadequate powers of local authorities in regard to arterial roads prior to 1909, Mr. Brodie well said that, if the intention of Parliament had been that it should be made as difficult and expensive as possible for public authorities to arrange for satisfactory main lines of communication within and outside a town, then these old powers were certainly well arranged for the purpose. Want of foresight in regard to this matter in the past is proving an exceedingly costly matter in most large towns at the present time. Experience has shown that, in the case of street improvements in central areas, about four-fifths of the whole expenditure goes in payment for houses and compensation, all of which would have been avoided if care had been taken to see that ample width for traffic purposes had been originally provided. Details which Mr. Brodie gave of the construction of a road 120 ft. in width on the outskirts of Liverpool were of special interest. Economies—particularly in regard to the method of laying the tramway track—enabled a street of this width to be constructed at the same cost as would have been necessary to provide for a street only 80 ft. wide, with tramways of the usual construction and paved complete. Dealing with the future of tramways, Mr. Brodie expressed the view that the main factor leading to success will be speed. But combined with speed there must be safety both for passengers and for the other users of the road, comfort for passengers and for the occupiers of frontage property, and reasonable economy. In the latter parts of his paper Mr. Brodie discussed the means to be adopted for securing these desirable ends. His observations in regard to the possibility of using some form of indiarubber tyre are specially noteworthy, but the whole paper—some extracts from which we propose to give next week—will well repay careful perusal.

The Paignton Surveyor and Motorists.

Certain "Motor Notes," the nature of which one may make a shrewd guess at, are responsible for a decidedly spirited report which the surveyor to the Paignton Urban District Council, Mr. C. O. Baines, made recently with respect to the condition of and traffic on the Totnes road, about 3½ miles of which are in the jurisdiction of the council. In order, presumably, that there should be no question of his doing things by halves, Mr. Baines told the council that he had traversed the whole stretch of road by motor car, motor bus, motor cycle and push bicycle. The surface "he found to be good enough for the maddest motorists." It was quite possible, he added, to travel at an average speed of 17 to 19 miles per hour. Whether this would be quite enough or even approximately enjoyable to the "maddest motorists" is, of course, open to question, but it was sufficient, at all events, for certain definite achievements, for the council were informed by Mr. Baines that "the ponderous motor omnibuses were able to cover the 3 miles from Collaton Village to the Toll-house at True-street in eleven minutes, including two stops for passengers and an additional stop for a vigorous exchange of compliments between the chauffeur and driver of a slow mineral-water wagon." Particularity being obviously an object that Mr. Baines had specially in view in dealing with this matter, he proceeded to state that he had made four journeys along the road, and the times were practically the same. "The people who appeared to ignore the statements regarding the road most," he observed, reflectively, "were the motor cyclists themselves, judging by the speed at which they travelled and the way they talked about their performances afterwards." In the latter sentence Mr. Baines has exposed with discernment something of the true inwardness of the motor cyclist, who is generally nothing if not a pace-at-any-price man. In the circumstances it is, perhaps, well that he and his complaints should not be always taken too seriously, but rather that he should be considered with indulgence—according to the not ungracious measure of Mr. Baines.

Electrolytic Disinfectant.

The report of Dr. Fredk. W. Alexander, medical officer of health for Poplar, contains an interesting reference to the electrolytic disinfecting fluid with which the name of that official has been associated for several years past. The fluid, we read, is still in great demand by the public. The baths superintendents repeat their statements that the addition of the fluid prevents the formation of slime in the water, and that there is no offensive smell when the baths are being cleansed. It should be explained that the electrolytic fluid in the Poplar baths is not used with the idea of rendering unnecessary periodic changes of the pond water, but to keep the water in the pond fresh and free from harmful organisms all the time it is in use. The class of persons who use the swimming ponds in Poplar is always likely to contain uncleanly or infected individuals, and it is to guard against danger from the latter that the fluid finds its chief application. At Poplar the electrolytic fluid costs in its preparation about £2 per 1,000 gallons, or a little less than ½d. per gallon. Thirty gallons are added to a swimming pond of 85,000 gallons capacity on first filling, and subsequent additions are made as required, at intervals of two or three days. A tribute to the efficacy of the process is the fact that, in addition to plants already supplied to the British War Office and Admiralty, others have quite recently been sent to Finland, Buenos Ayres, and Rangoon. The Gateshead Corporation have also given an order for a plant to be erected, and a large one is being installed for the Portsmouth Corporation. It is interesting to note that in the last case the fluid to be electrolysed is sea-water itself, which, of course, is close at hand, and a ready and powerful disinfectant is manufactured by this process without cost of materials but merely that of electric current.

Carnarvon Sea Wall.

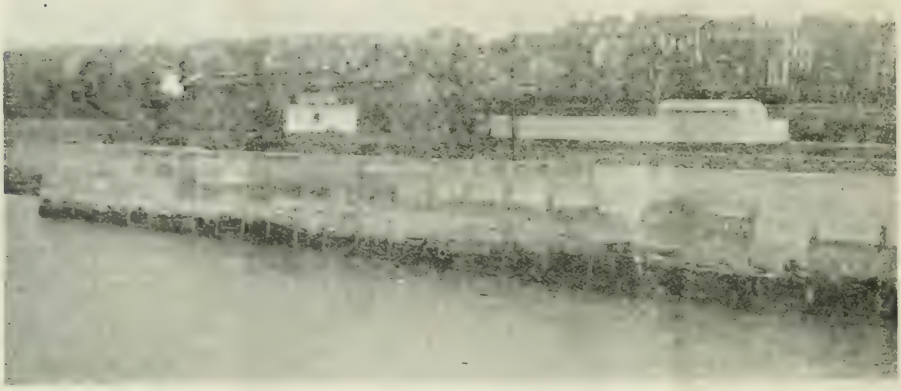
L. H. C. ETCHELL, Assoc.M.Inst.C.E.

A sea wall recently completed at Carnarvon Docks affords an interesting practical example of a method of effecting some desirable extension in carrying out local engineering work may be executed by the adoption of reinforced concrete as the material for construction.

The Port of Carnarvon, which until recently had been engaged chiefly in the slate export trade, has now become in addition to this an important local centre for the storage and distribution of petroleum and motor spirit. The rapid development of the import trade consequent upon the ever increasing demand for oil fuel led the Harbour Trust to consider the advisability of providing additional accommodation to cope with the traffic, which resulted in the adoption of a scheme prepared by their engineer, Mr. William Bowen-Jones, Assoc.M.Inst.C.E., which embraced a 300-ft. extension to the existing masonry sea wall, to afford increased wharfage for oil tank steamers, and the reclamation of about two acres of foreshore. The existing heavy masonry structure, 20 ft. high from shore to coping, rested on a foundation 6 ft. below [illegible] and it was originally intended to construct the extension in a similar manner.

As the line of the present structure follows approximately low water mark of ordinary tides, it will be readily appreciated that, in order to execute the new work satisfactorily in masonry, it would have been necessary to provide a full-tide dam. The expense of this temporary work, combined with the heavy cost of pumping involved in the construction of the lower portion of the wall, led to the abandonment of the masonry design in favour of a Kahn system reinforced concrete structure.

The requirements of the reinforced concrete design were to provide a wall which in the first place could be constructed with a minimum of interference from the tide, and in the second place which would withstand the full earth load at the back of the wall with the front face unloaded during low tide, and in the third place which would withstand shocks due to wave action without support from the earth filling at the back of the wall, as the intention of the Harbour Trust was to fill in behind the wall with dredg-



Front View—Carnarvon Sea Wall

Rear View—Carnarvon Sea Wall

mass, a process which would in all probability occupy a long period. The general character of the design is shown by the cross section of the wall.

It will be noticed that, broadly speaking, the construction consists of an ordinary type of reinforced concrete retaining wall carried on legs of reinforced concrete piles. That portion of the structure which is above mean sea level, and which could therefore be worked upon for five or six consecutive hours at each tide, is of the design usually adopted for retaining walls. The face slab of the structure has a batter of 1:10, and is supported by upright cantilevers spaced at 10-ft. centres, which in turn react upon the base of the wall in the usual manner. This base of the upper portion of the wall is carried upon reinforced concrete piles, two under each cantilever or buttress. One of these is lineable with the face of the wall, and the other is driven vertically, and is situated 18 in. from the back edge of the base slab. The lower portion of the face of the wall from the foundation up to the underside of the base of the superstructure is formed of reinforced concrete sheet piling, which enabled the work where it was below half-tide level to be cast in independent units, and driven into position, thereby overcoming the difficulties of tidal interference.

In the design of the work the bending, compressive and shearing stresses recommended for steel and concrete in the second report, 1912, of the R.I.B.A. Joint Committee were adopted.

The face slab is 6 in. thick and is reinforced near

DESIGN OF CARNARVON SEA WALL.

both the outer and the inner surfaces by a continuous beam, to resist the stresses due to the earth filling at the back of the wall at low tide, and also to resist the effect of impact of a 6-ft. wave striking the face of the wall at any level from shore to coping, and prior to the completion of the earth filling at the back of the wall. Inasmuch as the mean sea level at the front and back of the wall is the same at all stages of the tide, allowance was made for the support afforded by still water acting against the inner face.

The cantilevers or buttresses which support the face

[illegible] 18 in. by 8 in. at the base, tapering to 36 in. by 8 in. at the top, being designed of that depth under the coping to carry a dock rail 3 ft. above, making the full length of the wall.

The [illegible] at the back of these members, resisting the maximum bending moment due to earth pressure, consists of a group of Kahn rib bars having a total cross-sectional area of 2·05 sq. ins., and the reinforcement at the face, to resist the effect of impact of a wave striking the top 8 ft. of wall, consists of Kahn rib bars, having 1·12 sq. ins. cross-sectional area. The ends of these two groups of beam bars are anchored around the bottom reinforcement of the two longitudinal beams carrying the base slab. This slab is 10 in. thick, and extends as a cantilever 18 in. beyond the centre line of the back longitudinal beam. It is reinforced with ¾in. Kahn trussed bars at 13-in. centres on the 7-ft. span between the beams, and with ¾-in. Kahn rib bars at 19½-in. centres over the back support.

The two parallel longitudinal base beams are reinforced with Kahn bars as continuous beams to transmit the anchorage afforded by earth pressure on the base slab to the cantilevers described above.

The illustration on page 153 shows a stress diagram determining the value, position, and direction of the two alternative resultant thrusts, acting at the base of the superstructure, under the two main conditions of loading already referred to, as well as their resolution into vertical and horizontal forces distributed between the two king piles supporting each buttress. This same illustration shows the determination of the bending moments in the piles due to the wave action and to the earth filling. The designing of this portion of the work was necessarily complicated, owing to the fact that the piles are treated as vertical continuous beams, and deflect into peculiar shapes under the loading and wave impact.

The sheet piles were 18 in. by 6 in. cross section with semi-circular grooves running down the sides of the piles, and with a specially designed shoe having a projecting bead to fit into the grooves of the adjoining piles.

It was estimated that a rock foundation would be found at an average depth of 12 ft. below shore level, and therefore the king piles were designed 18 ft. long. The sheet piles were constructed 12 ft. long to allow for a 15 in. connection and a 6 ft. 6 in. drive.

The contract for the execution of the work was signed on the 8th May, 1913, and the work on the site was commenced on the 8th June. The first operation consisted of the casting of the piles. Both the king and sheet piles were cast as near as possible in the order they would be required, and driving was commenced nine weeks after the moulding of the first batch. One pile-driver was sufficient to enable the contractor to complete the work within six months, the specified time. The pile-driver was carried on an elevated track running parallel to the main line of the piles, the rails of which were approximately at mean tide level.

The work was commenced at that end of the wall which abuts against the masonry structure, and, as anticipated, the hardest driving was there experienced. The first few king piles, nine weeks old, were punished rather severely before they attained the necessary set, and driving was temporarily suspended for a further three weeks. The damaged heads of the piles were cut off, and when driving was resumed everything progressed satisfactorily, owing to the fact that the concrete had then sufficiently matured. The average rate of driving was eight piles per day, and work was commenced on the superstructure when about one-third of the foundation had been completed.

The concrete throughout the whole of the work consisted of Penmaenmawr granite chippings passing through a ¾-in. screen, Anglesey sand, and British Portland cement mixed in the proportions of 3:1½:1; and the reinforcing steel consisted of Kahn trussed and rib bars.

Illustrations are given of the front and back views of the completed structure before the filling operation at the back of the wall had been commenced.

The cost of the reinforced concrete structure was about £2,000. Tenders had originally been received for the construction of this 300-ft. length of wall in masonry, and the lowest offer in this case from contractors was £4,600. This illustrates the marked economy effected by the elimination of the difficulties of under-water construction by the use of reinforced concrete work.

Mr. W. H. Brocklesby, of Birkenhead, was the contractor for the work, which was carried out under the supervision of a clerk of works instructed by Mr. Wm. Bowen-Jones, A.M.I.C.E., engineer to the Carnarvon Harbour Trust, and by the writer of this article acting on behalf of the Trussed Concrete Steel Co. Ltd., who were responsible for the preparation of the detailed designs of the reinforced concrete work.*

BIRMINGHAM ROADS.

CITY ENGINEER'S REPORT.

The report of Mr. H. E. Stilgoe, M.INST.C.E., the city engineer and surveyor, on the work of the Birmingham public works department during the year ended March 31st last, has been issued.

Mr. Stilgoe remarks that the total expenditure on capital and revenue accounts in respect of highways, sewers and rivers, and public lighting, including the cost of administration of the various departments, of a sum equal to a rate of only 2s. 0·65d. in the £ is very low. The advance in the standard of efficiency in matters relating to public health and in the upkeep of the highways, combined with the ever-increasing demands of traffic, render it imperative that the streets shall be better constructed and maintained in a good condition of repair and cleanliness. The officials study every economy and care in administration, but the money provided for the purposes of the highways is insufficient to meet the demands. Many miles of roads have never been properly constructed, and an inspection of the trenches cut for sewers, mains, and other purposes reveals the fact that the majority of the old roads have no foundations at all. The surfaces have carried the light traffic of their day, but they will not withstand the modern traffic. In February last he reported upon the havoc wrought by the motor omnibus traffic, and presented a return of the cost of repairing the damage done, amounting to thousands of pounds. The streets are being gradually improved by reconstruction. In many of the streets where there is heavy traffic the houses are built right up to the back of the footpaths, and when the doors and windows are open the dust from the macadam very readily blows into the houses.

Mr. Stilgoe suggests that a great benefit would be conferred if these could be paved, a few each year. They could be kept clean more easily, and the health of the residents would thereby be improved. An expenditure for a few years of £10,000 a year on permanent work of this character would not be a great burden, considering that last year the produce of a penny rate on the improvement rate account was equal to £14,959.

COSTS.

The lengths of the declared highways were 599 miles on March 31st last, compared with 594 in 1913. The areas laid with granite sett paving were 20,864 super. yds. in 1913-14, 18,361 in 1912-13, and 18,045 in 1911-12. The expenditure on the maintenance of roads was as follows: Repairing macadamised roads, £54,884, cost per mile £104; repairing granite pavements £1,153, cost per mile £25; repairing wood pavements £6,090, cost per mile £219; cleansing paved streets £19,579, cost per mile £269; cleansing macadamised streets £34,772, cost per mile £66; watering paved streets £892, cost per mile £12; watering macadamised streets £3,592, cost per mile £6 16s. 6d.; gritting paved streets £2,117 19s. 10d., cost per mile £29 2s. 3d.; gritting macadamised streets £77 10s. 7d., cost per mile 2s. 11d. The approximate area of wood pavement maintained directly by the corporation is 202,698 sq. yds., the cost of which during the past year was £1,636 17s. 7d., being at the rate of 1·937d. per square yard.

TAR-SPRAYING.

The total area of macadam surfaces tar-sprayed was 1,771,515 super. yds.; the area sprayed a second time was 32,325 super. yds., making an area of street equal to 1,739,280 super. yds., comparable with a length of 134 miles 1 furlong 182 yds. The cost of the work was £6,803 16s. 7d., being at the rate of 0·92d. per super. yard.

The application of tar to the macadamised street surfaces had effected a saving in repairs, maintenance, and scavenging, and is continuing to give satisfaction.

* Our thanks are due to the company for permission to reproduce Mr. Ritchie's interesting article, which appears in the July issue of *Kahncrete Engineering*.

Institution of Municipal and County Engineers.

EASTERN DISTRICT MEETING AT TILBURY.

There was a goodly attendance at the Eastern District meeting of the Institution of Municipal and County Engineers held at Tilbury on Saturday last. Rain was falling when the members assembled shortly after ten o'clock at Tilbury Dock Station, and were received by the chairman of the urban district council, Mr. Alexander Brennan, J.P.; but the weather cleared off a few minutes later and permitted of the subsequent inspections of works being carried out according to the programme laid down.

An underground convenience which Mr. S. A. Hill-Willis, the surveyor to the local authority, has lately constructed, was first examined by the party, after which a section of Tarmac came in for attention. Passing into the docks the visitors next proceeded to make a tour of the extensions which Messrs. Topham, Jones & Railton have in hand for the Port of London Authority, the chief features of interest in this work being the extensive block-making yard and ballast washing and screening plant, the excavations which are in progress, the construction of quay walls on concrete monoliths, and the new sheds which are being erected. Piles of the "Simplex" type are being made use of in the foundations of the last-mentioned structures. Subsequently the members visited the new river jetty works, the contractors for which are Messrs. Perry & Co. (Bow), Limited, and found much to interest them in the operations of cylinder sinking and pile driving.

Luncheon was served at the Tilbury Hotel. Mr. H. T. Wakelam (Middlesex) district chairman, presided, and there were present Messrs. E. G. Allen (London), A. G. Bates (Hendon), J. Beck (South Ockenden), L. C. Bentley (Tilbury), A. Brennan (Tilbury), T. A. Capron (Tilbury), W. T. Clapton (East Ham), H. Collins (Colchester), E. B. Cook (Chiswick), H. T. Davies (Aylesbury), H. E. Denham (Chiswick), H. S. Denham (Port of London Authority), C. E. Evans (London), S. Farrar (Frinton-on-Sea), G. G. Feeney (Essex County Council), A. Freeman (Rickmansworth), S. C. Gordon (London), W. Gregory (Herts), S. A. Hill-Willis (Tilbury), N. Hoskins (Westminster), A. C. James (Grays), A. O. Laird (resident engineer, Tilbury Permanent Works, Port of London Authority), H. Lomas (Rickmansworth), W. Mackenzie (assistant engineer, Port of London Authority New Works), C. F. W. Marsh (Orsett), H. McDowell (Hendon), A. E. Peake (Essex County Council), P Pittman (London), G. Marlow Reed (Middlesex County Council), E. J. Reynolds (Friern Barnet), J. Rogers (Chadwell St. Mary), A. W. Schelff (Westminster), W. Sheffield (Tilbury), C. Chambers-Smith (Westminster), P. G. Thorly (Southend-on-Sea), E. O. Tompkins (Stanford-le-Hope Parochial Committee), E. C. Wadhams (Tilbury), J. A. Webb (Hendon), hon. district secretary, C. Wilden (Tilbury), E. Willis (Chiswick), F. J. Winter (Southend-on-Sea), and H. York (East Barnet Valley).

The only toast was that of "The King."

The CHAIRMAN remarked that they had had a most interesting inspection of the works which the Port of London Authority were carrying out at Tilbury. He was exceedingly surprised to see how the work was being done, and he did not think the institution had ever before seen anything so interesting as the sinking of the monoliths, some 600 tons in weight, on which the new quay walls were being founded. Those members who had been unable to attend that day were to be sympathised with in having missed seeing what had been thrown open to their inspection. They had with them one of the resident engineers, Mr. Laird, and he wished through that gentleman to convey to Mr. Kirkpatrick, the chief engineer to the Port of London Authority, their sincere thanks for the facilities he had given for their visit to the docks; at the same time he desired to express the indebtedness of the members to the several representatives of the Authority for showing them over the works.

A cordial vote of thanks was passed to Mr. Kirkpatrick.

Mr. LAIRD returned thanks on behalf of the staff at Tilbury for the kind remarks of Mr. Wakelam, and said he was sure Mr. Kirkpatrick would be glad to know the members' journey to the district had been a profitable one, so far as the docks were concerned.

After the reading of the minutes of the previous district meeting—held at Bedford—consideration was given to the following paper:—

TILBURY AND SOME PARTICULARS OF A NEW SEWERAGE SCHEME IN THE ADJOINING RURAL DISTRICT.

By S. A. HILL-WILLIS,
Engineer and Surveyor to the Tilbury Urban District Council.

[Mr. Hill-Willis served his articles under Mr. W. B. G. Bennett during the time the latter was borough engineer of Southampton, and for the past nineteen years has been continuously employed on municipal work under either State, county borough, urban or rural district authorities. He was appointed first surveyor to the newly formed Tilbury Urban District Council in 1912, having been for some years previously engineer to the Orsett Rural Authority, for whom, in addition to the general routine work, he designed three sewerage and sewage disposal schemes, and carried out by administration a new water supply scheme comprising several miles of cast-iron mains, engine-house and water tower.]

The urban district of Tilbury is one of the latest to be admitted to the ranks of self-governing districts, having been constituted in April, 1912. It has, however, some historic associations, and is also notable for its docks, which accommodate the largest vessels entering the Port of London. . . .

The Tilbury Docks, which were opened in 1886, are now under the control of the Port of London Authority, having been constructed in about four years at a cost of about £3,000,000 from plans by Mr. A. Manning, engineer to the East and West India Dock Company. Additions to the dock accommodation are now being carried out at a cost of about £350,000 by Messrs. Topham, Jones & Railton, under the direction of Mr. C. R. S. Kirkpatrick, M.INST.C.E., the chief engineer to the Port of London Authority. The extensions include the addition of 1,600 ft. to the South Quay, and three large transit sheds, 550 ft., 600 ft., and 650 ft. long and 120 ft. wide. The present system consists of a main dock with three branch docks, having a total water area of 54 acres. The main dock is now being extended to a length 3,230 ft. and a width of 600 ft.

A most interesting piece of work is the construction of the new quay walls, which are being founded on monoliths, sunk to the ballast at a depth of 60 ft. below coping. The docks are connected with a tidal basin by means of a lock 700 ft. long and 80 ft. wide, with a depth of 44 ft. on the outer cill and 38 ft. on the inner cill, which is the depth at high-water spring tide in the main and branch docks. The dry docks here, of which there are two, 846 ft. long, are the largest in the Port of London.

Another improvement, upon which work is now in hand, is the construction immediately south of the dock entrance of a deep-water riverside jetty for the use of cargo steamers.

[illegible] and 50 ft. wide. It is being built in reinforced concrete (Hennebique system), and will receive an equipment of modern electric cranes with capacities [illegible] landing stage at Liverpool. The landing stage according to present plans is to be 1,000 ft. long and 80 ft. wide.

The sewerage system inside the docks is under the control of the urban district council, the total length of sewers being 3¾ miles, with seventy-six manholes.

TILBURY WORKMEN'S DWELLINGS: PLATE 3

up to 3 tons. Railway access to the jetty is now being provided, and the completion of this work will add considerably to the facilities for dealing with cargoes in the river. It is now under consideration to provide to the north of the dock entrance a riverside passenger landing stage on the lines of the Prince's

The Midland Railway Company, who have recently acquired the London, Tilbury, and Southend Railway, have this year completed the purchase of some 48 acres of land, being a portion of the Christ's Hospital estate (Winchester). This land, lying between the Tilbury Railway Station and Pier and the Tilbury

Fort, has river and road frontages and abuts on to the [illegible] Company's lines. The place paid a [illegible] per annum. It was expected that the company would [illegible] on the [illegible] their Continental traffic and provide increased railway facilities.

SEWERAGE.

[illegible] with 167 manholes, a [illegible] Ward [illegible] the dock area [illegible] 6 in. to 15 in. Minor extensions (1¼ miles, 30 manholes) have been carried out [illegible] Government Board, and out of current expenditure, [illegible] bulk of this work has been carried out by [illegible] with either Hassall's (double lined) or Parker's joints supported on a not less than 6-in. concrete foundation. The manholes in all cases, in addition to 9 in. thickness of brickwork, have a 6-in. concrete backing. In some cases steel wire lattice reinforcement has been laid on the concrete foundation throughout the whole length of the sewer.

LIGHTING.

[illegible] the public lamps were maintained by the local authority, gas only being supplied by a company. The average cost of lighting was: North Ward £2 16s. 4d. per lamp per annum; South Ward £4 5s. 2d. per lamp per annum. The average candle-power of the original upright burners (Bray C) was [illegible] 60 candles. The author has [illegible] scheme, recently carried out, which included the provision and erection of twenty-four 300-candle power lamps in parts of two of the principal streets, and a 2,600-candle power bracket lamp at the junction of Dock and Calcutta roads. Fifty-nine 100-candle power lamps have been provided and erected in various parts of the district, and all existing 60-candle power lamps have been converted to 100-candle power (Bray inverted burners) and re-erected in approved positions. The maintenance by the council has been abandoned, and a contract has been entered into with the gas company to provide gas and maintain the whole of the lamps for a term of seven years at the following prices:—600-candle power, £10 per annum; 300-candle power, £5 18s. per annum; 100-candle power, £3 10s. per annum.

The hours of lighting in the North and South Wards are from one hour after sunset to twelve midnight all the year round, and the lamps are fitted with automatic lighters of the "Simplex" clockwork type supplied by the Metropolitan Gas Meter Company.

The cost of gas for ordinary purposes in the urban area is 3s. 8d. per 1,000 cub. ft. If by automatic slot meter, the price charged is about 1s. per 1,000 extra, which include a free installation, comprising a meter, cooker, and three lights. Gas for power purposes is 3s. 3d. per 1,000.

UNDERGROUND CONVENIENCE.

The author has designed and carried out by administration an underground convenience at the junction of Dock-road and the Broadway. The cost of the work was £1,040, and owing to the nature of the subsoil careful timbering was necessary. The interior is lined with white glazed bricks; owing to the number of pavement lights, all the water-closets, &c., are exceptionally light by day. About £100 per annum is taken for the use of the water-closets and washes, but two attendants are necessary, and the cost of upkeep, including repayment of loan, is about £300 per annum.

ROADS.

During the years 1900-6 (when the district was under rural administration) some fourteen streets were made up under the Private Street Works Act of 1892 at a total cost of £13,344. The cost per foot frontage in some cases worked out as low as 6s., and in the majority of streets no channels were provided. The form of construction adopted was simply a foundation of large chalk flints topped with a coating of pit gravel and Kentish flints. (Several of these have since been coated with from 3 in. to 4 in. of quartzite or granite.) Norwegian granite kerbs were provided and ordinary ballast paths.

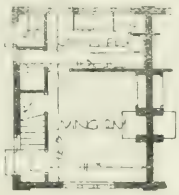
The first set of new streets to be made up by the urban authority is now in hand.

The estimated cost per foot to frontagers as served in provisional apportionment was 8s. 10d. The actual cost will be probably about 8s. The cost of channelling (2s. 3d. per foot-run) is to be defrayed by the council, as channels were not inserted in many of the streets formerly made up under the road authority. The council have adopted the clause which enforces the payment of trade union rate of wages.

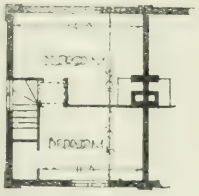
The footpaths in the main streets are paved with Kentish rag tar-paving 2½ in. in thickness, the bottom coat being 1½ in. thick, and composed of ¾-in. to 1¼-in. gauge, the top coat 1 in. thick of ¾-in. to ½-in. gauge; both layers separately rolled, and the surface finished with a sprinkling of Derbyshire spar. The remainder of the paths are gravel, painted with ordinary tar and coated with sand and chippings. This latter is gradually being taken up and Kentish rag-stone tar-paving put in its place. The average contract price is 2s. 2d. per square yard, and about 2,000 sq. yds. are at present laid annually.

Experimental lengths of tar-macadam have been put down near one of the railway stations (Dock Station), also a section of quartzite grouted with bitumen; both have given good results.

The principal trouble in the South Ward at present is the lack of an efficient system of surface-water drainage, and last year the author brought forward



Ground Plan.



First Floor Plan.

(Class C.)

TILBURY WORKMEN'S DWELLINGS: PLATE 3.

a preliminary scheme for dealing with this by means of a main trunk concrete sewer (1 mile in extent) to deliver into the Thames at a point near the World's End, the diameter being 6 ft., and the invert level at its point of discharge—9 ordnance datum. The estimated cost of the new scheme is £28,400, and it is proposed to remodel the existing surface-water drainage, of which there is at present 4 miles, to gravitate into it. Difficulty is, however, met with in securing suitable gradients, owing to the fact that the general surface level of the whole of the South Ward ranges from 4 to 6 ordnance datum. The completed scheme has not yet received the sanction of the urban district council, who meanwhile are marking time, as it were, with regard to any further road construction works. Instructions have now been given for a comprehensive scheme to be prepared dealing with the whole of the district roads in order to meet with the exigencies of modern traffic, including the channelling of the remainder of the streets in the South Ward.

No time will be lost in bringing this new road construction scheme before the council when once the Local Government Board sanction has been received for the surface-water scheme. To carry out the ordinary repairs the council purchased this year an Aveling & Porter roller and tractor (combined plant), and about 2,000 tons of Kentish rag and Jersey granite are being unloaded at the Fort Wharf and hauled to various parts of the district to deal with immediate repairs. Since the purchase of the above plant there is no doubt that a saving has been effected on the contract system, especially in the haulage of materials to the North Ward. The council have their own tar-spraying machine (200 gallons capacity), tar boilers, &c., and all the public roads

in the South Ward were treated in 1912 with [illegible] Tarvia, with the exception of [illegible] were [illegible] with Kentishtone. A [illegible] and covered with granite chippings.

The costs were as under: Dehydrated tar, at 2½d. per gallon, covered with fine hoggin, 1s. per yard super. Tarvia, 4½d. per gallon, covered with fine hoggin, 2½d. per yard super. Kentishtone, 4½d. per yard, 26 to the gallon, equals 6·11d. per gallon, laid in covers of 9 yds. covered with fine chippings, 3½d. per yard super. Water bound road, consisting of Corallian gravel in centre and Kentish ragstone sides, covered with hoggin, 1s. 4½d. per yard.

HOUSING.

Almost ever since the formation of the urban district, the council has been impressed with the inadequacy of housing facilities in their area. About 4,000 persons earn their living at the docks over 2,000 of whom take tickets between the docks and places as far up the line as Leamington-street and for Gravesend. In addition to this, when the improvements now in hand are completed, it is estimated many more hands will be employed. There is not a single empty house in the district. Tilbury intends to be self-sufficing—hence the housing scheme. The council also wish that the houses to be provided shall not only be useful and economical, but also beautiful and in pleasant surroundings, and to this end has had a comprehensive scheme prepared by the well-known town planning architects, Messrs. Pepler & Allen, F.S.I., F.R.I.B.A., of Arundel-street, Strand, in conjunction with the author. This scheme, which has been approved by the council, and tendered for, now awaits the sanction of the Local Government Board, and embraces altogether 234 houses to be built of brick with tile roofs. The brick to be used is three shades of dimidled red sand, faced with lighter quoins from Messrs. Collier, of Marks Tey, pointed in cement outside, and the roofs covered with red sand-faced tiles. The area of land utilised for the present housing scheme equals 15½ acres, and for future housing the council are acquiring 11¼ acres. The houses are divided into three classes.

Class A.—Containing living-room, parlour, scullery, bath, and three good bedrooms. Nett rent 6s. 8d. per week; with rates and taxes, 9s. 3d. per week.

Class B.—Containing living-room, scullery, bath, and three good bedrooms. Nett rent, 5s. 2d. per week, with rates and taxes, 7s. per week.

Class C.—Containing living room, scullery, bath, and two good bedrooms. Nett rent 4s. per week; with rates and taxes, 5s. 3d. per week.

Average cost of cottages, 7d. per cubic foot, excluding sewers and roads. The scheme comprises three groups of houses, two being in the South Ward, near the docks, and comprising respectively 100 and 104 houses, and one in the North Ward, consisting of thirty houses. The South Ward groups contain fifty of Class A and fifty of Class B, in blocks of fours and pairs, and 104 of Class C in blocks of eight and four. That in the North Ward comprises only pairs of Class A.

Open spaces are provided, and the houses are pleasantly grouped, and each set should comprise an agreeable settlement.

There are many difficulties to contend with, as all the South Ward of Tilbury is low and the ground is unstable, and reinforced concrete rafts were necessary for the cottages. In the North Ward, owing to the hills, the gradients of portions of which are as steep as 1 in 8, the cost of carting is high.

Despite these difficulties, it will be found the rents to be charged are well below the local average for similar accomodation, and the cottages more pleasant and agreeable in themselves and in their surroundings, and much better built on proper foundations, even when building is far more costly than when the existing cottages were put up. The reason for the grouping is partly governed by the shape of the district, which is long and narrow, running up from the Thames on the flat for about two miles to the hills.

The South Ward comprises all the flat land and the North Ward upland. The desire of the council being that their district should grow out to the hills, they have made up and lighted the Manor Way, which is the road leading to them, and are erecting on the highest ground 30 superior cottages in pairs. These cottages are likely to be taken by those workmen whose shorter hours allow time for the journey to and fro the docks. The reason for the greater number in the South Ward is nearness to the docks for those who work there. In time, no doubt, houses will extend from the flats to the hills, and 'buses or trams will make the journey to the docks a very small matter.

Having this in view, the council are, with wise foresight, in conjunction with the housing scheme, obtaining 20 acres [illegible] and for park and recreation ground and 29 acres for additional allotments. The proposed charge for the new allotments is 6d. per rod per annum, which is the same rental as those at present in use. Owing to the wet and deep ditches surrounding the land proposed to be laid out for allotments no serious scheme of fencing will be necessary.

STANFORD-LE-HOPE MAIN SEWERAGE AND SEWAGE DISPOSAL WORKS.

In 1910 portions of the parishes of Mucking and Horndon-on-the-Hill near the Stanford-le-Hope railway station were added to the parish of Stanford-le-Hope and a new sewerage system designed to serve the added areas in addition to new estates in the original parish. At the same time the old contact beds at the works were found to be inadequate, and to bring the system to a state of efficiency it was found necessary to lay down an entirely new works on more up-to-date lines.

The new scheme, which was completed last year at a cost of £12,228 (excluding easements), comprised:

(1) The laying of 4½ miles of sewers.

(2) The laying of a rising main and air mains from the pumping station to the disposal works.

(3) The provision of oil engines and air compressors at the pumping station, with enlargements of existing engine-house.

(4) The provision of ejectors at the outfall works to lift the high level sewage to the new tanks

(5) The construction of continuous flow settlement tanks, percolating filters, sand filters, storm-water filters, and sludge drying beds.

The present population of Stanford-le-hope is 2,500. The dry weather flow of sewage in connection with the scheme was taken at 20 gallons per head per day. The sewerage system takes in rainfall from roofs and paved yards, but not from road gullies. Therefore the sewage may be considered as strong, especially as there is scarcely any subsoil water in the sewers. A brewery and a laundry are connected.

The original sewered area was divided into two districts, one being the high level, from which the sewage gravitated to the beds, and the other, quite a small portion in comparison, being the low level, the sewage from which was lifted at the pumping station through a short length of rising main and discharged into the high level sewer.

Under the new scheme the populations draining into the high and low level became equal—viz., 1,250 in each, and the length of rising main through which the sewage was lifted from the low level to the high level was therefore abandoned and a rising main 635 yds. in length laid, through which the sewage is lifted from the low level direct to the new separating chamber at the works. The existing 15-in. diam. high level sewer, after having received an addition, still gravitates to the works, but the sewage on arrival is lifted by means of ejectors (2-50 gallons each capacity) to the new separating chamber, where it delivers side by side with that of the low level.

For the sewers the future population was taken as 5,000 in each district. On this basis the low level sewer is capable of discharging about nine times the mean dry-weather flow and the high level sewer about sixteen times.

OUTFALL WORKS.

The new outfall works are designed to deal with a population 25 per cent. in excess of the present population of 2,500.

Detritus Tanks.—No. 2 are provided each 6 ft. by 4 ft., which approximately equals 1-100th of dry-weather flow.

Continuous Flow Settlement Tanks.—No. 3 provided total liquid capacity equals 52,906 gallons is 84 per cent. of the dry-weather flow of 62,500 gallons.

Percolating Filters.—No. 3 provided containing together 1,143 cubic yds. of filtering material. Taking the dry-weather flow of 62,500 gallons per day, filtration rate of 55 gallons per cube yard per day is attained, or if the quantity from the brewery and laundry is added, the rate is 59 gallons per cube yard per day.

Humus Chamber and Sand Filters.—From the filters the effluent passes through six humus chambers over

a weir to a distributing channel communicating with six sand filters each of which is 117 sq. yds. area. From the sand filters the effluent passes to outlet chambers, the level of the inverts of which are 11·0 ordnance datum. From these it passes along a stoneware carrier direct to the tidal stream.

Storm Water, Low Level District.—Here are pumps capable of dealing with a maximum volume of the dry weather flow from the present population. There are three storm tanks with a combined capacity of 4,250 cubic yards, and 12-in. pipes and 2,300 ft. of 9-in. pipe will be laid in addition. This added to the capacity in the pump well is equivalent to about seven hours' flow of six volumes of the present dry-weather flow.

Storm Water, High Level District.—At the entrance to the sewage works of the main works a weir is placed limiting the flow passing to the tank to three volumes of sewage and to shall from a population 25 per cent in excess of the present. Any excess above this first three volumes passes to a stand-by tank having a capacity of twenty inches of the dry-weather flow. From the standby tank the storm water passes to a distributing channel to No. 3 storm-water filters, each

Disposal Works.—The floors and interior sides of [illegible] are formed of concrete finished with a ½-in. topping of cement mortar while the concrete was [illegible]. The walls are formed with [illegible] brick. The filtering medium at the bottom of filter for a thickness of 1 ft. was broken [illegible] to pass through a 4-in. mesh, and be rejected by a 1-in. mesh. The remaining filter medium is composed of clinker broken [illegible] to pass through a 2½-in. mesh, and be rejected by a 1½-in. mesh. The distributors are of the rotary type to suit beds 54 ft. diameter, and are capable of dealing with a minimum flow of 25 gallons per minute and a maximum of 100 gallons per minute. The medium to bottom of each filters is composed of clean sharp, coarse gravel, and the medium above the latter consists of Leighton Buzzard filter sand 12 in. in thickness.

The contractors for the sewers and works were Messrs. W. & C. French, of Buckhurst-hill, the contractors for machinery, ejectors and air mains being Messrs. Tuke & Bell, Ltd.; Mr. L. L. Todhunter acted as clerk of works, and Mr. G. Hayward as inspector of works.

REPORT

on the examination of a sample of sewage and effluent from the new works by Dr. John C. Thresh, Medical Officer of Health, Essex County Council, September 17th, 1913.

(1) Sewage entering Stanford-le-Hope Sewage Works.
(2) Effluent leaving " " " "
(Results in parts per 100,000).

	1.	2.
Colour	Black	Yellow
Odour	Offensive, strong	Faint, earthy
Turbidity ..	70—80	15
Suspended matter ..	Large amount	Under 5 pts. per 100,000
Chlorine	14·4	16·2
Nitrites	0·0	Present
Nitrates and nitrites	0·0	1·2
Nitrogen as free ammonia ...	7·15	3·70
Albuminoid ammonia	2·8	0·20
Oxygen absorbed in 4 hours	18·61	1·61
Dissolved oxygen absorption in 5 days (R.C.)...	—	1·5
Impurity figure .	2·1	1·0
Remarks —	On Royal Commission basis impurity figure is 1·8%. Sewage therefore is a "strong" one.	After 5 days' incubation at 65° C. sample had undergone no change or developed any tendency to become putrid.

To convert results into grains per gallon multiply by 7.

In conclusion, the author wishes to express his thanks to Mr. C. R. S. Kirkpatrick, M.I.C.E., chief engineer to the Port of London Authority, for his kindness in granting permission for the new dock works to be visited, and arranging for some of his staff to show the members of the institution around the new works, also to the chairman and members of the

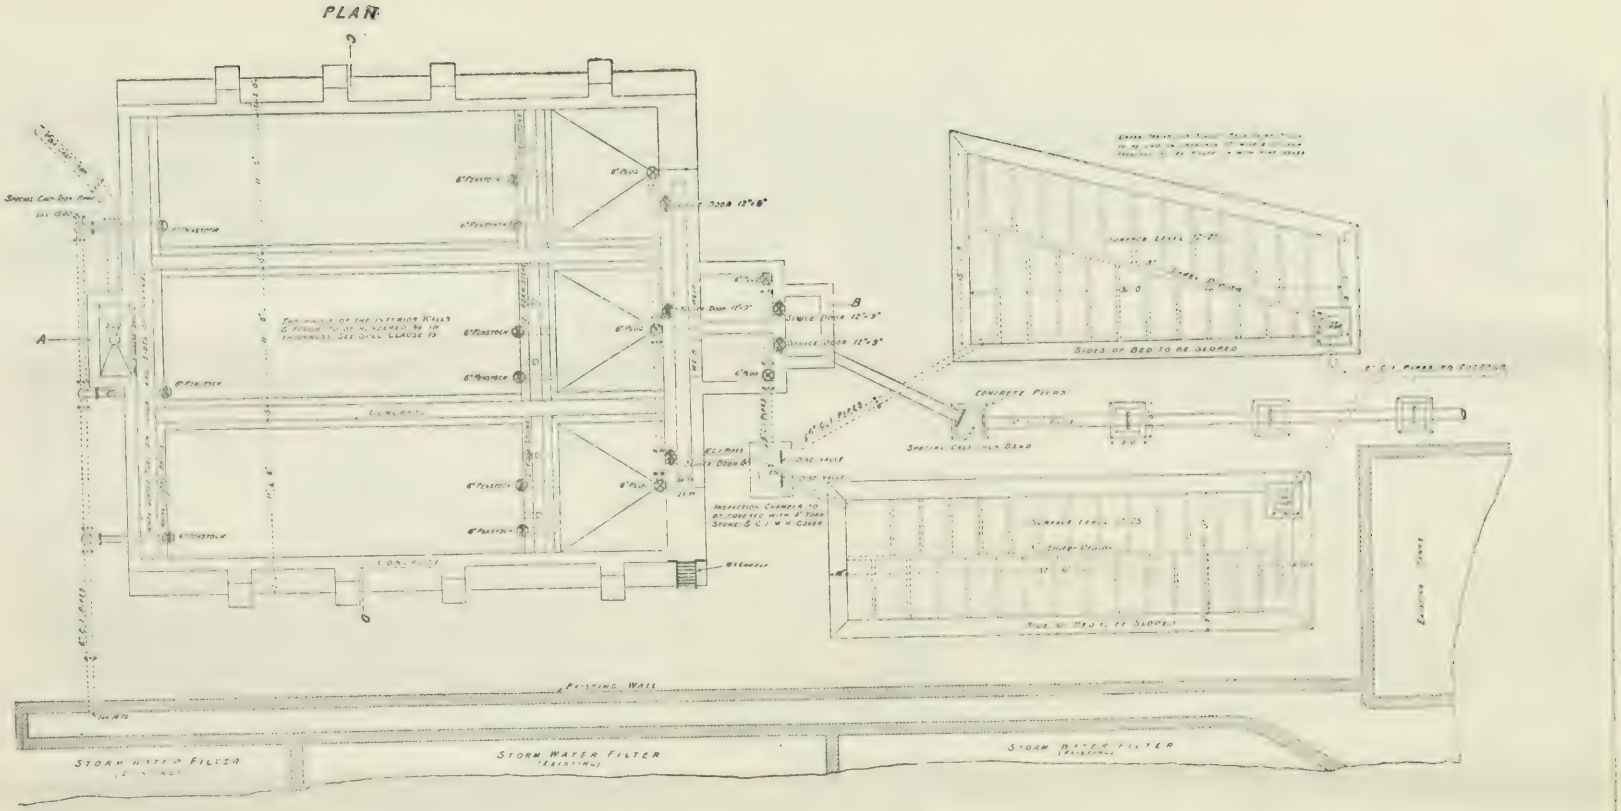
Stanford-le-Hope Sewage Disposal Works: General Plan.

(Scale, 64 ft. to an inch.)

1,234 sq. yds. area, given a total area of 702 sq. yds. From these filters the effluent is passed on to an irrigation area of three acres, and thence to the tidal stream.

Details of Construction.—The majority of the sewers were composed of first quality stoneware socketed Hassall's pattern pipes, with double-lined joints jointed with plastic and liquid cement laid on a concrete foundation. About one mile of sewer in the low level was specified to be of 12-in. dia. cast-iron pipes jointed with white hempen spun yarn and pure lead laid on a concrete foundation 2 ft. wide by 6 in. in depth. Owing to the treacherous nature of the ground (running sand) opened up all through this section, the author ordered double decking to be placed under the concrete at an extra cost of 5s. 6d. per yd. lineal. The double decking consisted of four widths of 9 in. by 1½ in. yellow deal fixed longitudinally in trench with 9 in. by 1½ in. fixed crossways over the whole trench bottom. The cost of this sewer laid, excluding manholes, was 26s. per yard lineal. The sewers had to be carried through the railway of the Midland Company (L.T. & S.R. section) in two places, including the Stanford-le-Hope railway level crossing. The sewers commissioners have control over the stream, and the Stanford-le-Hope bridge is the property of the Essex County Council. An accompanying plate No. 5 shows the requirements of some of these authorities.

Manholes.—The manholes are built in 9-in. and 14-in. brickwork (Flettons) in cement mortar, and rest on a concrete foundation, and are surrounded with concrete. The benchings are formed in concrete rendered in cement, and the inverts of half-glazed channels.



STANFORD-LE-HOPE SEWAGE DISPOSAL WORKS: TANKS AND SLUDGE BEDS.
(Scale, 12 ft. to the inch.)

Orsett Rural District Council for permitting the Stanford-le-Hope disposal works to be viewed and Major Crookshank, R.E. (Officer Commanding Royal Engineers), for granting permission enabling the Seventeenth Century stone gateway and septic tank metal-lattice at Tilbury Fort to be inspected. He would also like to acknowledge assistance in preparing this paper rendered by the officers of the Orsett Rural Authority, including Mr. F. T. Johnson, highway surveyor, and the author's former pupil and assistant, Mr. C. F. W. Marsh, engineering surveyor.

DISCUSSION OF MR. HILL-WILLIS' PAPER.

Mr. E. Willis (Chiswick) said he had had the pleasure of knowing Mr. Hill-Willis for a good number of years, and had watched the steady rise he had made in the profession. The District Council of Tilbury were fortunate in having him as their engineer, and the institution on having that paper from him, and in moving a very hearty vote of thanks to him he was sure it would be received with acclamation. There was one matter that appealed to him, and would, he thought, appeal to everyone in that room. Mr. Hill-Willis had mentioned in his paper that there was not a single empty house in the district—a most exceptional position for any district council to be in, and a great help to any local authority in regard to the receipts from the rates. It was a record upon which the council and its officers were to be congratulated. They had been fortunate in the visits which had been arranged on their behalf—particularly those in the docks area. He believed it was the only place in England where the monolithic construction which they had an opportunity of viewing that morning could be seen on such an extensive scale. The difficulties that had existed in the past in connection with that particular dock extension were well known. With regard to the ferro-concrete construction that was being carried out by Messrs. Perry & Co., it was a pity that it was not low tide at the time of their inspection, but the general scheme was an education in itself for those who lived in places where miniature docks were under their control. As to ferro-concrete work, he was not a believer in that for everything, but it was an ideal method of construction in some positions, and that was one where its utility had been made use of to the utmost.

Mr. J. A. Webb (Hendon) said he had very great pleasure in seconding the proposition to thank Mr. Hill-Willis for his very excellent paper and for the trouble he (the speaker) personally knew he had taken to make that meeting a success and give the members some insight into work they did not see every day. Mr. Hill-Willis had stated that the average cost of his cottage was 7d. per foot, exclusive of sewers, roads, &c., and it would be interesting to know what was the cost inclusive of those items. On behalf of the institution he desired to express cordial thanks to Mr. Brennan, the chairman of the district council, for attending that meeting and giving them his help, and to the council generally for the facilities they had given them in connection with the visits. He thought the local authority were to be congratulated on realising their responsibilities in the matter of the provision of dwellings for the workmen engaged in the district. By doing that they were anticipating and providing for the future. Their thanks were also due to Mr. Tompkins, chairman of the Stanford-le-Hope Parochial Committee, for attending their meeting. The Stanford sewerage scheme was an ideal one for a small population.

The vote of thanks was passed.

Mr. Alexander Brennan, chairman of the district council, said he did not think anyone was more worthy of their respect than Mr. Hill-Willis, who was an ideal surveyor.

Mr. Hill-Willis, in reply, observed that as far back as twenty years ago, when a pupil at Southampton, he had looked forward to the day when he would be in a position to receive the institution. That day had now arrived, and he trusted the visit would prove of interest to them all, and that they would not regret the time they had spent in the district. He very much regretted the absence of the chairman of the rural district council, who had unfortunately been prevented from attending, but he was very pleased to find the chairman of the urban district council had found it possible to be present, and he thanked him very much for the kind remarks which he had made concerning himself (the speaker). The chairman of the Stanford-le-Hope Parochial Committee was present, and he was glad he had seen fit to come, especially as he had recently had a very severe accident. Mr. Webb's question as to the cost of the houses was very difficult to answer. He had really asked for an analysis of the prices, and he could only give the information by referring to the priced quantities. Otherwise they would be misleading.

[Mr. Hill-Willis has since furnished us with the following statement: "In reply to Mr. Webb, who asked for cost of roads, and sewers, &c., in connection with the housing scheme, I have now had an opportunity of further examining the priced quantities, and the costs are as follows: Cost of House, Class A, £275; Cost of House, Class B, £239; Cost of House, Class C, £168. The cost of fencing, roads, paths, soil and surface water sewers, &c., is, £8.564 8s., or £36 12s. per house in addition. Out of this amount of £8,564 8s. a sum of £4,539 is not, however, chargeable to the housing scheme, as this expenditure represents the channelling of roads and laying of sewers, which work is by practice in this town borne out of the general district rate."]

During the afternoon the members visited the adjoining rural district of Stanford-le-Hope and inspected the sewage disposal works described in Mr. Hill-Willis's paper. In returning, the sites for the new workmen's dwellings were passed.

Later the party were entertained to tea by Mr. Hill-Willis at the Tilbury Hotel.

THE CHELTENHAM MEETING: GENERAL ENGINEERING SUBJECTS.

Following the proceedings reported in last week's issue, Mr. T. Caink, Assoc.M.Inst.C.E., presented a paper dealing with Worcester Sewage Disposal Works. The paper in question is reproduced on p. 176 of this issue.

DISCUSSION OF MR. CAINK'S PAPER.

Mr. E. J. Silcock (Westminster) said he had great pleasure in proposing a vote of thanks to the author of this paper because Mr. Caink had treated the subject, as he always did, with a great amount of originality of thought. This paper was of very great interest. It presented the subject to them in a new light, and Mr. Caink had not taken anything for granted, and had not slavishly followed what had gone before. He should confine his remarks to the question of sewage purification, but should refer incidentally to the pumping plant that was provided. They were told that the pumping plant was of three units—of 2,000,000 gallons, 4,000,000 gallons, and 6,000,000 gallons capacity respectively. If they were restricted to three units those units should be of the respective proportions given. But he ventured to say that those units should be larger than in this particular instance. The dry-weather flow was 2,000,000 gallons a day, so when the three units were working together they could only pump six times the dry-weather flow, with no stand-by. In his opinion the small unit, instead of 2,000,000 gallons, should have been 4,000,000 gallons to lift the dry-weather flow; the second unit of 4,000,000 gallons should have been 8,000,000 gallons, so that the first and second units could have pumped six times the dry-weather flow; and, in the alternative, the third unit should have been 12,000,000 gallons, so that, working alone, it could lift six times the dry-weather flow, and be able to deal with the whole of the storm water. Passing on to the sewage purification, the author had endeavoured to introduce a system which would involve practically the doing away with sludge, as they knew it, and the production of a continuous system of purification. The system that Mr. Caink had put down—apart from what he had referred to in his opening remarks—was to a very great extent similar to a system of purification experimented upon at the Leeds works some years ago, and dignified by the name of the Leeds system, by which fresh sewage was pumped direct on to bacteria beds, and the whole of the suspended matter was put through the bed and subsequently removed by a sand filter, which was intended to act as a screen. Mr. Caink seemed to have a very similar system, because his tank treatment was only a two and a-half hours' storage. It was really only two hours' storage on the dry-weather flow, and therefore at the average rate of flow the sewage went on to the oxidising beds in a comparatively fresh state. That system was one which could be perfectly well carried out,

knew, fresh sewage had very little smell. Further, after this matter had passed through the beds it became to a large extent oxidised, and when separated from the liquids by the ... ance. This system was tried and found successful, ... operation for the last six years. The only objection to it was that it was more costly than the tank process. Where they wanted to establish works in the immediate neighbourhood of houses, or where land was very expensive, that was a system which could be applied and carried on without creating nuisance; but their works must be larger than if they had the tank system of separating the solids before passing on to the beds. That increased the cost of installation. Unless they had circumstances which compelled them to do it, this system was not one which they would adopt from the economical point of view. Taking the principal features of this scheme, the first step appeared to be, in Mr. Caink's case, the breaking down of the grosser suspended matter by means of roughing filters, in which the sewage as it went to ... it up into fine particles, otherwise they would always be clogging the surface of the bacteria beds and choking up the sprinklers. That was one of the very essential steps to carry out. If that step could be successfully done in the way Mr. Caink suggested, well and good. He thought very likely for a purely domestic sewage the system he adopted would be ... especially where the textile trades were carried on, the sewage contained too much fibre for the process to be effected by means of gravel beds, as at Worcester. It was found they required some kind of revolving screen which would intercept the fibre, and from which the fibre could be removed. The next point to which he wished to refer was with regard to the size of the medium used in bacteria beds. They found that, in order to get this system working properly, it was no use attempting to arrest the suspended matter until after it had been through the oxidising beds, and the beds must be constructed of material large enough to allow everything to go through. In order to do that they were compelled to have the beds of greater depth than when dealing with a similar process with tanks, otherwise the sewage passed through it too quickly to allow the oxidising process to go on. They must have a bed of 10 ft. in depth, and the material so ... as easily as possible. Having got it through, they could separate it by the sand filter, and when separated it was perfectly innocuous, and there was no difficulty in dealing with it. Instead of having part ... tank deposit, because they had a reservoir to take all the night flow of sewage. A small deposit took place there, and was the only sludge they had on those works in the ordinary sense at all. Now, with regard to the suggestion Mr. Caink had made with regard to dealing with the sewage by means of a continuous upward flow through the bacteria beds, in order to get the solid matter through the beds in an upward direction they were bound to have sewage passing through at a very considerable velocity. They were working against gravity. In the case he referred to they were working with gravity; every time a particle of deposit got moved it went a little lower down. Passing the sewage in the upward direction they must have a velocity of 2 or 3 ft. per second to push the suspended matter through the bed. If the sewage was to pass through a bed at that velocity it would not have time to be purified at all. It seemed ... bed, they were going to push a fresh quantity of ... done this it would be on the surface and in the liquid, and consequently there must be a third process of downward filtration to separate what had been pushed through the second filter. Those two objec- ... they could supply oxygen by artificial means, septic conditions would be set up in this filter-bed, and they would not have an oxidising process at all. Attempts had been made at one or two places to oxidise sewage by blowing air through it. He was told that Dr. Fowler was carrying on experiments at Manchester by which he hoped to do away with bacteria beds altogether. In the Manchester experiments air would be blown direct into the sewage, and there would be no bacteria beds at all. The difficulty was that the air being blown in escaped in bubbles, and did not mingle with the whole of the sewage. In other words, they could not bring the oxygen into intimate contact with the oxidisable matter in the liquid by blowing air through it. It was to overcome that difficulty that the trickling or percolating filter had been introduced. It was to bring the liquid and the oxidising matter into immediate contact with the bacteria, and those bacteria into immediate contact with the air. Every time the suction had stopped the air went in, and gave the bacteria a fresh start. If, on the other hand, the bed was permanently waterlogged every time they ... ceased, and septic conditions would be set up again. It was never safe to prophesy, but he did venture to think that the continuous upward working on the lines suggested by Mr. Caink would not be satisfactory for very long. On the other hand, he thought the works as Mr Caink had ...

Mr. J. A. Webb (Hendon) thanked Mr. Caink for the very able description of the works, and Mr. Silcock for the graphic criticism he had given.

Mr. A. J. Price (Lytham) said, having been at Worcester five years, he claimed to have some little knowledge of this question, especially as he was there when the first part of the work was carried out as the result of a competition. He was one of the competitors. He wished to refer particularly ... ing the sewage under the river from one side to the other in the form of an inverted syphon was the result of a scheme adopted by a well-known engineering firm. After the syphon was put in it was found it would not work. This was due to causes which ... Caink described it, the concrete shafts had their outlets at a height of 36 ft. above the inverts of the pipes into a chamber. The method adopted was to take the sewage from the west to the east side of the river by two 20-in. pipes in a cast-iron pipe of 6 ft. 6 in. diameter. The velocity in the 20-in. pipes ... calculation to find the difference in the velocity between 20 in. and 4 ft., and they got the velocity of 3ft. per second in the the 20-in. pipes reduced in the 4-ft. chamber to one-seventh. That was the primary cause of the syphon not being able to work. Mr. Caink had foreseen this from the beginning, and the method by which he got over the difficulty was by making the pump well at the pumping station the ascending leg of the syphon, which could be lowered at will by pumping, and therefore could be kept perfectly clear. This was one of the most interesting engineering mistakes he had known to take place. With regard to Mr. Silcock's suggestion as to doubling the pumping capacity, he said that they could not afford to put in pumps which were more than required by the Local Government Board. The Local Government Board did not require a pumping capacity of more than six times the dry-weather flow, and he thought if they were to put in the capacity of twelve times the dry-weather flow they would get the order of the sack.

Mr. Caink, in reply, said he was not in agreement with Mr. Silcock as to the desirability of laying down larger units. Engines and pumps running at half their load did not conduce to economy of working. He should certainly prefer, if increase were needed, to add to their number rather than their size. With regard to the proposed method of purification by upward filtration, Mr. Silcock was of opinion that to remove the solids from the filter a velocity of 2 ft. to 3 ft. per second would be required, and purification would be absent. If it were desired to remove the solids immediately they entered the filter, he agreed,

but the reverse of that was desired. What was sought was to detain the solids for a time in the filter, and allow the liquid to separate from them and continue its upward course through the filter. The subsequent slow removal of the solids then became a matter not of velocity, but of pressure—pressure to drive them through the interstices of the filtering medium against the resistance of the medium. That pressure might be applied at a rate as low as desired, and, of course, would vary directly as the quantity of liquid discharged through a given area of filter. The actual rate in practice would probably not be many inches an hour. The maximum pressure needed to force the solids through against the resistance of the material would be the specific gravity of the mass of the medium multiplied into its depth. A head of water equal to twice the depth of the filter applied to the underside would be sufficient to lift the entire mass and force anything through it. Mr. Silcock expressed the view that the waterlogging of the filter would induce septic action and prevent aërobic purification. But was not the absence of such purification from waterlogging due to the absence of oxygen? If it were, and he supposed it would be generally conceded, then the presumption was that a sufficient supply of oxygen would restore the purification. With regard to the short circuiting of the air, he proposed to prevent that by pumping directly into the main conveying the tank effluent to the filters, and sending the mixture of air and liquid to find their escape together upward through the interstices of the material. He did not think short circuiting by that arrangement would be possible in an appreciable degree. In any case the air must pass through the entire depth of water and medium before it found its exit into the air. Mr. Silcock thought that in order to arrest the finally digested solids a tertiary bed would be required. With a little reflection, however, he would see that when these solids had been driven up through the secondary sand beds, the water might be decanted off from the surface of these beds at a speed slow enough to deposit any suspended matter, the speed depending upon the area of filter and depth of water flowing over the surface; in other words upon the volume of water moving towards the outlet.

SOME RECENT PUBLICATIONS.*

BUILDING CONSTRUCTION DRAWING. Part I. By R. B. Eaton. Price 1s. 6d. nett. London: E. & F. N. Spon, Limited.

This little work consists of a series of twenty-six plates illustrative of elementary building construction. The drawings are very clear, and dimensions are given in all cases. Short specifications are appended to many of the drawings, a feature the practical utility of which will be readily conceded. The author is the lecturer on Building Construction at the Poole School of Art and Technology, and writes as a teacher primarily for the student.

GOODWILL: ITS NATURE AND HOW TO VALUE IT. By P. D. Leake. Price 1s. 6d. nett. London: Gee & Co.

This pamphlet deals with a subject which is of great importance to all who are concerned with the management of profit-seeking undertakings. The author is a chartered accountant of great experience, and speaks with authority on a difficult and highly technical subject.

Divining Rod Tests.—In the presence of the chairman and members of the Haslemere Urban District Council, Surrey, the Rev. J. S. Leake, vicar of Grayswood, and Colonel Glennie carried out a series of tests as water diviners at Blackdown on Tuesday. It is stated that they first traced roughly the line of the three principal headings from which water is now obtained without any previous knowledge of the site. Then at another part the divining rods strongly indicated the presence of water running in three main streams. At one spot the movement of the divining rod in Colonel Glennie's hand was so strong that the rod snapped. The authorities are seeking to augment the public water supply.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Why was advantage not taken of the opportunity to carry out a "street improvement" when the new offices of the Middlesex County Council were erected at the east end of Victoria-street? Would it not have been possible, without sacrificing any space, to have so adjusted the frontage of this building that the entrance to Little Sanctuary need not have been a wide and ugly funnel, and that the "pinch" opposite the Abbey might have been greatly improved? Why is it that so many improvements in London are spoilt for want of a little forethought and prearrangement between the interested parties?

Are we not all agreed that the policy of the Road Board, as expressed in their recently published report, is the right one—viz.: "That the most pressing and the most universal need is the strengthening and improvement of the crusts [which include foundations as well as surface coatings] of existing roads"? Is it not very satisfactory to find that the Road Board have during their short life already exceeded the most sanguine expectation as to their activities?

* * * *

When will the great inconvenience of the Committee Rooms of the Houses of Parliament be altered? Is it not a fact that they are now utterly inadequate in their accommodation, and that most of the witnesses have to stand for hours before they are "called," and that, although it may be very comfortable for the Committee and for counsel, the rest of the "crowd" have a most uncomfortable and trying time of it? Can a witness be "at his best" after such an ordeal? Is it a fact that, notwithstanding this well-known inconvenience, it is now proposed to give the overworked Members of Parliament further "lounge rooms," while the Committee rooms are to be left untouched?

* * * *

Has not the time arrived when there should be additional facilities provided for the purchase of postage stamps at some of the larger post offices? Do we not find that the sale of Insurance stamps has reached such gigantic proportions that the would-be purchaser of "postage" stamps has often to wait a considerable time before his wants are attended to? Would it not be better to have a special counter marked "Insurance stamps" and another "Postage stamps"?

* * * *

Apropos of the proposed tax on motor omnibuses using the new Great West Road out of London, in order to meet the cost of maintenance, why should not horses and other animals using this road be taxed, as they are the primary cause of the cost of scavenging?

* * * *

How many surveyors have read Lord Justice Fletcher Moulton's splendidly worded judgment in the Appeal Court on the Billericay Rural District Council and the Poplar Guardians' case, in which he pointed out that the present "law with regard to the user of our roads is that every member of the public is entitled to use them properly as much as he needs"? How does this apply to the restrictions which are to be placed on the free use of the new Great West Road?

* * * *

How does the Legislature which imposed a tax on the omnibus for using this road reconcile its action with the following further words used by Lord Justice Fletcher Moulton: "The community have come definitely to the conclusion that absolute freedom of user, coupled with communal upkeep of the roads, is the wisest thing for the nation"?

* * * *

Is not the imposition of a tax on the motor omnibuses using the proposed new road rather in the nature of a confession that the road engineer is unable to construct a road which is capable of withstanding the requirements of modern traffic, and is this really the case? Was there not in the minds of those who suggested this tax some ulterior motive beyond the mere desire to impose such a restriction on legitimate traffic?

Royal Sanitary Institute Congress at Blackpool.

SEWAGE DISPOSAL QUESTIONS.

Several interesting papers on matters connected with sewage purification were read to the Engineering and Municipal Section of the recent Congress of the Royal Sanitary Institute at Blackpool. One of these, by Mr. J. P. Purvis, Consulting Engineer, and Dr. E. H. Black, dealt with

SOME CONDITIONS AFFECTING THE PURIFICATION OF POLLUTED RIVERS.

Dr. Purvis stated that in the course of a series of investigations of the oxygen content of the River Cam below and above Cambridge Sewage Effluent they considered several conditions which influence the degree of pollution and purification of the river. They determined the amount of oxygen dissolved in the river at 100 ft. above the effluent outfall, that actually was found in the effluent itself, and also the amount at the junction of the effluent and river, 50 ft. and quarter mile below the outfall. The samples were taken at depths of 1½ ft. and 3 ft. in the middle of the stream, and they were analysed again after five days incubation at 18 deg. Cent. to see how much oxygen had been taken up. The observations were continued from May to December, 1913, inclusive, so that the seasonal changes could be surveyed.

The outstanding results showed that three influences at least could be selected which affected the amount of oxygen dissolved in the stream and its absorption. These three influences were (1) the varying degree of the rainfall, with which is connected a considerable amount of pollution, (2) the number of hours of sunshine, with which is connected the purifying effect of the oxygen given out by the aquatic plants under such influence; and (3) the changes in the temperature of the water (and therefore closely allied to the second factor), with which is connected the varying amounts of oxygen which water dissolves from the air at different temperatures.

It seemed as if there were a kind of balance. In the summer months the lessened solubility of the oxygen in the river, caused by the higher temperature, was more than compensated by the increased discharge of oxygen from the aquatic plants; and the increased solubility of the oxygen in the winter months, caused by the lower temperature, partly compensated for the lessened discharge of the oxygen from the plants. There could hardly be any doubt however that the purification of polluted streams was assisted, not only by the oxygen from the air and from such plants as might be growing in the river, but also by the absorption by such plants of various dissolved constituents like ammonia salts and nitrates, as had been clearly shown by Letts in his investigation with *Ulva latissima*.

SELF-PURIFICATION OF A RIVER IN AN INDUSTRIAL DISTRICT.

In a paper on this subject Mr. James Crabtree, M.Sc., A.I.C., pointed out that in the eighth report of the Royal Commission on Sewage Disposal, recommending new standards of effluents based on observations of several rivers, no mention was made of the position of authorities situated on rivers whose waters exceeded their proposed limiting figure of 0·4 parts dissolved oxygen absorbed per 100,000. Only two of the rivers under their observation come under this category (the Ray and Brent), and no specific reference was made to them.

Most of the rivers passing through congested manufacturing districts must, on account of their frequent pollution by domestic and trades wastes, come under this class; indeed, it was doubtful if many of them could ever be brought up to the commission standard. The river Mersey in Lancashire would be classed as a "bad" river by the Royal Commission, and it was to a four-mile reach of this stream near Manchester that the remarks below apply.

"Previous to arriving at this stretch, the river has flowed about 50 miles, and received sewage effluents from many towns (chief of which are Stalybridge, Ashton-under-Lyne, Hyde, Denton, Stockport and Glossop), in addition to factory wastes; and, as the flow in dry weather amounts to about 30,000,000 gallons per day, so far as can be gauged by the eye, a considerable fraction of this amount must be sewage-derived liquor.

The river varies in width from about 25 to 75 ft., in depth from 2 to 12 ft., and has an average velocity of about 2·5 ft. per second, being thus a "very rapid" river according to the Royal Commission's scale. The water-level rises several inches in the afternoons, and after a fall of rain the river swells rapidly. The banks have been raised to prevent floods. The water is brown and turbid in appearance, and fungoid growths are present on the bed and sides of the stream. In dry weather the dissolved oxygen content averages between 10 and 20 per cent. saturation, but is sometimes *nil*, and always the source of pollution to be considered (*v. infra*), the dissolved oxygen absorbed in five days at 65 deg. Fah. averaged 1·7 parts per 100,000, and sometimes reached 3·00. Yet though the average temperature of the water during the observations was 60 deg. Fah., the water never gave rise to aerial nuisance, was always non-putrefactive on incubation, and contained some nitrate. The condition of the bed, however, left something to be desired, for spells of dry weather resulted in the accumulation of a black deposit, particularly in slack water, and this when stirred up by the next flush following rain gave rise to some odour for short periods.

"In the four miles between Chorlton and Urmston three sources of pollution occur:—

"(1) The Chorlton Brook, 5,000,000 gallons per day, mainly of effluents from the Manchester Corporation's Withington and Gorton Sewage Works, and averaging: Dissolved oxygen absorbed in five days 5·08 parts per 100,000; 4 hours oxygen absorbed from permanganate 3·55 parts per 100,000. (2) 1,000,000 gallons weak precipitation effluent from the Sale sewage outfall, but whose effect was found to be negligible. (3) 1,000,000 gallons from the Moss Side sewage works, averaging: Dissolved oxygen absorbed 5 days, 9·30 parts per 100,000; 4 hours oxygen absorption 2·29 parts per 100,000.

"None of these produced any result visible to the eye, and the effects were studied in a series of samples taken on the way down the river by a special appliance whereby the samples could be collected beneath the surface of the water in mid-stream. The quality of the river water was found to vary at one point in surprising manner."

As it was not possible to follow one particular batch of water on its way down the river, one individual series of figures was in consequence of little use, and reliable results could only be obtained by averaging a number of series. When the results of the oxygen absorbed were plotted against distance travelled, the effect of the Chorlton Brook on the river water and the gradual recovery of the latter were very apparent, and by extrapolating the recovery curve was deduced that the river regained its former state after traversing four miles. This four miles was covered in about two and a half hours, which meant that according to the dissolved oxygen absorbed test, between four and five million gallons of sewage-derived liquor were oxidised by at most 10 dilutions of river water in two and a half hours. It was to this fact and to the absence of nuisance (except that due to suspended matter) from a river classed in the Royal Commission's scale as "bad" that attention was drawn by the author of the paper.

RE-AERATION OF SEA WATER.

Prof. E. A. Letts and Mr. Charles W. Addy submitted a paper dealing with experiments carried out by them with reference to the factors which come into operation in the aeration of sea-water. Anyone, they said, who has watched the effects of a storm on the sea shore must have noticed the tendency of salt water to foam when strongly agitated. That fresh water did not show the same characteristic was easily demonstrated by shaking two similar bottles, one containing fresh and the other sea water, when it would be found that the air bubbles arising from the former were relatively speaking large and reached the surface almost instantly, whereas those from the second were minute and required a much longer time to ascend. It seemed to the authors that this difference between the behaviour of salt and fresh water might have an important influence on the rate of re-aeration of a sheet of water polluted by sewage, and therefore at

[illegible]

DISCUSSION

Mr. Mawley said that many of them as municipal officials were unable to concentrate their attention to an extent like Mr. Watson and Dr. Fowler on matters of this kind, but they greatly appreciated the frank way in which these gentlemen brought the result of the work before them [see last week's SURVEYOR, p. 139]. For himself he might say he had got a vastly better result with tanks one-quarter the dry-weather flow and one contact bed than he had with tanks of twenty-four hours' flow and two contact beds. They obtained better results by getting into an aërobic condition as early as possible. By the quarter dry-weather flow and one contact bed they found they got better results when putting the effluent on old pasture, and they did not foul the grass. He had consequently constructed a scheme of twelve contact beds and a quarter dry-weather flow, and they had been worked for over seven years. They were constantly testing the water capacity, and they found it was 33 per cent of the gross capacity of the bed. It had been a success in every way, and they fell within the standard recommended by the Royal Commission.

Mr. A. E. Collins (Norwich) expressed the hope that something would come of the experiments to which Mr. Watson had alluded.

Mr. W. Kaye Parry (Dublin) said he was working on this subject with Dr. Adeney many years ago, and he would remind engineers present that Mr. Lowcock made some very interesting experiments many years ago in air blowing through his contact beds with very good results. Then for a long time this question rather lay in abeyance, and they were very glad to hear that Dr. Fowler and Mr. Watson had taken the matter up again, for he was certain it was one which deserved more thorough investigation than it had received.

Mr. H. Collins (Norwich) observed that engineers who were concerned in the pumping of sewage might find it better to use air lifts than any other system.

Mr. A. E. Prescott (Eastbourne) said that about two years ago he installed an air lift, and after it was put down they noticed that after the sewage had been lifted and discharged there was a great improvement in it owing to the mixture of air with it. There had been considerably less smell, and the sewage was not so obnoxious, and in every way there had been a great improvement in regard to the quality of the sewage. He thought it bore out the suggestion that a mixture of air with sewage had undoubtedly an important effect upon the quality of the sewage.

Mr. A. J. Martin (London) said this much seemed to be established—that the method of purifying sewage by forced aëration was a technical possibility and a technical success. What remained to be seen was how it compared with other methods from a financial point of view. One point which struck him with regard to the whole of the discussion was that it should be possible to have papers of this kind at this time of day when the question of sewage disposal had been permanently before them for something like twenty-five years. It seemed to be rather a reflection on their reputation as a common-sense people. The only explanation he could find was that this question of sewage disposal was allowed to be stereotyped. The whole question of sewage disposal had been in a more or less stereotyped condition, and they had been content to adopt rule-of-thumb recipes for tanks and filters, and so on. In contrast with the doctrinaire attitude which had prevailed in this country with regard to sewage disposal, he would call attention to the action of a State having a population that exceeds that of the West Riding of Yorkshire, and which for the last thirty years had carried out a remarkable series of experiments on the purification of sewage. He referred, of course, to the Massachusetts State Board of Health. It was a disgrace that in this country, with overcrowding manufacturing districts and overcrowded rivers, a matter of vital importance of this kind should have been allowed to drift without the guidance to be obtained from well-considered, systematic experiments and research in the purification of sewage. He knew that an enormous amount of valuable work had been carried out, but it was in almost every case with the sole object of determining what methods were best adapted for treating a particular sewage in a particular area. They wanted something more than that. They wanted to lay the foundations, and they ought to be close, well-directed, scientific work, to ascertain the particulars which underlay the whole system of treatment. At Exeter a year ago he advocated that the Government should take this matter systematically in hand, and that they should have a research department to carry on, at the expense of the country, the work which had hitherto been done in a more or less piecemeal fashion by corporations like Manchester, Leeds and Leicester. He hoped as the result of the new light which had been thrown on an old question by the work of Dr. Fowler and Mr. Watson and other gentlemen, they would realise that the last word had not been said with regard to the purification of sewage, and they would not make up their minds that salvation lay in one particular direction only. He trusted that the work which had been carried on by individual municipalities would be pursued on a far larger scale, and in far greater detail, by the Royal Commission on Sewage Disposal or some department of the Local Government Board formed to carry it on.

Mr. J. S. Brodie (Blackpool) said he had to deal with a sewer which was used both as an outfall sewer and as a tank for storing the sewage between the tides, and he had had very considerable difficulty in keeping this 600 yds. of 6-ft. sewer from being a nuisance. He put up various 16 ft. diameter ventilating shafts, but they were not as good as he had hoped they would be, and as a last resort he put down a fairly large electrically-driven fan and blew pure air into the sewer, by that means obtaining the very happiest results. He had had no further trouble in getting the conditions of the sewer in a fairly innocuous state. When Mr. Watson opened his address he thought he had in his blundering way forestalled him. (Laughter.) Anyhow, that little experiment of pushing fresh air into the sewer, instead of drawing foul air out, was the means of curing an offensive smell.

Mr. Watson said they should be extremely careful not to let the public run away with the idea that there was going to be another revolution in sewage treatment. They were all very sanguine twenty or more years ago when the septic tank advocates suggested that sludge could be got rid of very easily and cheaply. As a matter of fact they were pioneers, but in course of time they found that the sludge was not so easily got rid of. He would like to say how much he appreciated the paper of Dr. Letts. They were tremendously indebted to Dr. Letts for the great work he had done, and his further contribution to the subject deserved their heartiest thanks.

Dr. Fowler said that Dr. Letts had emphasised the difference in the behaviour between sea water and river water, and to any of those present who had to discharge their sewage into the sea it was a point which should be very carefully considered. The discharge into sea water was totally different in many ways from a discharge into fresh water, owing to chemical and biological differences. He had occasion some time ago to study the discharge of sewage on the ebb tide near Harwich, and he found then that the changes which went on were considerably different in sea water from what they would expect in fresh water. It only emphasised the fact which, in his view, could not be too strongly emphasised, that a really successful solution of the sewage problem had not yet been obtained. With unpleasant sludge on the one hand, and unpleasant stinks from filtration, no one could say that the difficulty was solved. They were doing better, but they had not solved the problem. In order to solve it, it was necessary they should have the patience to go step by step into the apparently minute details of a scientific character. That rather brought him to the point he wished to ask about this aëration question, which interested them all. Mr. Watson had brought forward some interesting experiments, and he was glad he was going into the engineering side of the matter, as it was a side which wanted to be very carefully considered just now. But mere blowing of air into sewage was of very little use *per se*. They knew that many had blown air into sewage in various ways with somewhat disappointing results. He ventured to say the reason for that was just the lack of knowing the essential conditions for bringing about a change. They might blow air through domestic sewage and nothing would occur at all, but if they knew the right conditions for blowing, then in two hours they could convert the worst sewage into an effluent better than they could get with a complete double contact system. That was if they knew

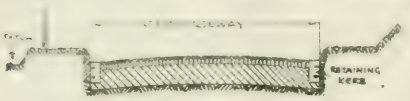
new. (Laughter.) That was what they were endeavouring to do in Manchester. He might say that the work at Manchester, which he explained at Exeter last year, had gone much further during the year, and in every expectation of being able to effect a great considerable amplification in the [illegible] of sewage. They need not be afraid that anything very extraordinary was going to happen in the way of stopping the works, because the advantage of the method was that they could carry it out to the extent they liked. They could spend as much or as little money as they liked. It might be a good thing to be quite certain about anything in sewage, but he did not certain that if the same amount of money was spent in the scientific application of all—not more or knowledge—a more practical investment [illegible] money.

(To be continued.)

LATERAL SUPPORT FOR ROAD CRUSTS.

By A. DRYLAND, M.INST.C.E.,
County Surveyor of Surrey.

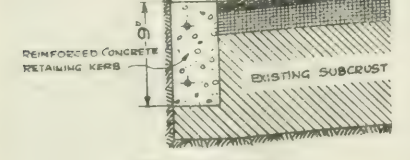
In the South and East of England, where hard rocks do not obtain, almost all the road crusts, except those which have been constructed in new streets in towns, are composed entirely of compacted road metal, chiefly gravel or flints, with no supporting substratum of pitching between the road crust and the natural subsoil. On rounds in the North and West, where either hard rock or slag has been plentiful and cheap, [illegible]



CROSS SECTION OF ROADWAY.

[illegible] more fortunate, and would not dream of constructing a road to carry any considerable traffic without such a bed at least 6 in. thick, and generally much thicker, of solidly compacted pitching. The same practice has been followed wherever local rock has been available, and the author does not for a moment dispute its desirability, as he well knows its beneficial effect; but there are some thousands of miles of main and district roads in the portions of England first mentioned which have carried fairly heavy traffic in the past, and will have still heavier traffic to carry in the future, without any supporting pitching.

Many surveyors have been heard to suggest that all our roads will, in the near future, require to be re-



DETAIL OF KERB.

constructed with a pitched foundation. This would be an enormously expensive operation—in fact, in many places where ballast is plentiful it would be cheaper to put in a concrete foundation; but having had pretty good opportunities of studying this question on all sorts of road and subsoils, with a varied range of traffic, the author takes leave to doubt whether any such expensive necessity will arise, as he thinks the requirements can be met in a far less expensive manner, in most cases, where there is at present a good crust composed of well-compacted metal.

On most of our older roads, where gravel, flints and some local sandstone rocks have been used for many years, the crusts are extremely well compacted by the traffic of several generations, and if well drained, and surface water is excluded, need nearly as much [illegible] up as they were originally laid. The weak point in these roads is, the author thinks, [illegible] the sides as the material loses small portions lateral support, and the method of strengthening he is adopting is to form submerged continuous reinforced-concrete retaining kerbs to prevent [illegible] of the crust. [illegible] the quantity and traffic of the traffic in the past, it was confined largely to the centre of the road, and until the steam roller came in almost [illegible] were covered to enable the centre.

Steam rolling has been in common use for a [illegible] but now in this part of England, and a great deal has been done towards strengthening the sides; but generally there is considerably less strength there than at the centre, and the [illegible] consolidated [illegible] soil of the old bank, margin or grass [illegible] support. If a continuous [illegible] inserted between the metal and the margin to confine the road crust and to take the lateral thrust, it will, it is believed, add immensely to the [illegible] power of the road to sustain the traffic, and, what is also of great importance, provide an abutment to the bituminous crusts which are now being constructed.

Some sketches are given to illustrate the suggestions. The author thinks that, as a general rule, on good subsoils with a sound road crust a depth of 9 in. will be sufficient, and a thickness of 4 in. of 6 to 1 concrete composed of fine, clean ballast, with a couple of small reinforcing rods to give continuity. For this purpose the author has hitherto used, as a readily available expedient, a couple of strands of barbed wire. Preference might be given by some surveyors to the use of a thicker and deeper kerb, omitting the reinforcement, but it is thought the reinforcement serves a useful purpose in giving a tensional strength. On roads where heavy motor traffic is becoming common there is a tendency of the heavy vehicles to keep fairly close to the near side to avoid being constantly troubled to pull out to allow faster traffic to pass, and it is this tendency of the passage of heavy vehicles, and the resulting distortion of bituminous crusts which almost invariably begins at the sides, which has impressed upon the author the necessity of side support.

With regard to cost, the author considers that where good, clean, fine ballast can be obtained at a reasonable price the cost of a 9-in. by 4-in. reinforced kerb should not exceed 1s. 6d., or at any rate 1s. 9d., per yard run of side. On a road 8 yds. wide this works out at, say, 5d. per yard super. of road surface, and the suggestion made is that, at any rate where 4s. or 5s. per super. yard is going to be spent on a bituminous surface, the extra 5d. to obtain lateral support is well worth expending.

The author does not for a moment claim any novelty for the idea of lateral support, which he believes is as old as the days of the Romans; but he does suggest that circumstances of traffic have arisen which make it desirable to devote more attention to the subject than has been given in the recent past.

Motor Fire Engine for Gravesend.—The Gravesend Fire Brigade has just received delivery of a new motor fire engine of the very latest type. This machine is of the Merryweather "Hatfield" design, is capable of delivering 350 gallons per minute, and carries a 50-ft. fire escape as well as a 30-gallon tank which supplies water for a "first-aid" jet.

British Fire Prevention Committee.—The British Fire Prevention Committee concluded its summer session last week with a series of tests relating to wired glazing, both in the form of skylights and casements (submitted by Messrs. Pilkingtons, of St. Helens), for classification under the committee's standards. The skylight test was an hour test; three of the window openings that had been glazed were submitted to a one-hour test, and another three to a 1½-hour test, the temperatures in each case ranging from 1,500 deg. to 1,650 deg. Fahr., and the fire test being immediately followed by the application of water from the steam fire engine. The reports of these tests will be issued in due course. Having regard to the number of applications for interesting tests with fire-resisting materials and systems of construction, the committee have decided this year to have a vacation session, and there will thus be tests during August and September. These will include a series of sprinkler tests, a series of tests as to the application of gases to the extinguishing of fire in ship holds, and a series of extinguisher tests, while the autumn session will include a number of tests with constructional work.

ASSOCIATION OF SOMERSET SURVEYORS.

MEETING AT WILLITON.

Mr. W. A. Collins, surveyor to the Bridgwater Rural District Council, the president, occupied the chair at a meeting of the Association of Somerset Surveyors held at Williton on the 15th inst., there being also present Messrs. E. Stead (Somerset County), D. Edwards, hon. secretary (Taunton), R. Stephens (Chard Rural), C. Durie (Williton Rural), J. Johnson (Keynsham Rural), T. G. Crump (Taunton Rural), L. Caplen (Yeovil Rural), E. W. Hearn (Chard), J. R. Lamacraft (Williton Rural), R. Neads (Wells), R. E. Jackman (Williton Rural), John Lovell (Axbridge Rural), and J. J. S. Hayman and E. A. Wadmore (Bridgwater Rural), A. F. Luttrell (chairman of the Williton Rural District Council), F. Risden (clerk to the Williton Rural District Council), and W. Brownscombe (a member of the Williton Rural District Council).

In welcoming the members, Mr. A. F. Luttrell, chairman of the Williton Rural District Council, said it was recognised to-day that the surveyor must be a man who must be trained on highly skilled and scientific lines. In former times the surveyor often used to keep half an eye on the roads, a quarter of an eye on sanitary matters, and a quarter of an eye on something else; but now he was a whole-time officer, and a highly trained man.

The president then took the chair, and announced that Mr. C. Durie, highway surveyor to the rural district council, had prepared two papers for discussion, the first of which related to

HIGHWAY ADMINISTRATION IN WILLITON RURAL DISTRICT.

Mr. DURIE stated that the area of the whole district was 99,511 acres, and the mileage of roads was: Main roads, nearly 71½ miles; district roads, 290 miles. The eastern portion of the district comprised 38¾ miles of main roads and 142 miles of district roads, in addition to which there were 4½ miles of church footpaths maintained. For road surfacing and repairs an excellent quality of old Devonian sandstone, fine grained and tough, was obtained from the western side and the north point of the Quantock Hills, some of which he hoped to see used as tar-macadam in the near future. In July, 1911, the Williton Council commenced the system of direct labour. With the beginning of the new financial year following, this system was extended to a few miles of main and district roads, and the working of the council's most important quarry, Bicknoller, was included. In 1913-14 the area was considerably increased, the year commencing with 23½ miles of main roads and 63¾ miles of district roads being placed under the direct-labour system. The principle was also applied to the more important main roads in the western division. A further extension had since been made in his division, there being now left under the contract system only two miles of main roads and 54¾ miles of district roads. The policy of making the change and developing the system on gradual lines had been a wise one, and accounted, in a large measure, for its successful working. He had been able to arrange the working areas so that each gang had a quarry to fall back upon, where useful work was always wanting to be done. The getting and sorting of stone from eight quarries in the division was done by direct labour. All wages, cost of tools, and tool repairs, quarrying requisites, sheds and expenses, including fencing, in carrying out the work, were charged to the quarry account, while the returns to the quarry account were based on the prices at which the contractor was paid at the time the quarry was taken over, prices ranging from 6d. to 9d. per yard for gravel and stone.

In his second paper Mr. Durie dealt with the Highway Act Amendment Act of 1885. So far as he knew, he did not think this Act was generally taken advantage of by other road authorities, particularly as regarded the topping of roadside hedges. The Williton Council undertook to do this work with a view to keeping the hedges down and obtaining a dry and healthy road, as well as in order to have uniform fences. The manual labour for what he termed hedging and ditching on district roads did not come to £4 a mile, which undoubtedly was very cheap, and in considering why this should be so he had come to the conclusion that the road being kept dry and healthy by low hedges not only undoubtedly made it last longer, but also saved manual labour in regard to scraping and cleaning.

The PRESIDENT, in proposing a vote of thanks to Mr. Durie, congratulated the Williton Rural District Council upon introducing the system of direct labour, adding that he was sure the time was not far distant when the council would see by the results that it was well worth doing, and the system would be extended throughout the whole district. The Act of 1885 had been taken advantage of in the Bridgwater district. The hedges were sheared, but they were not topped to the extent they were in the Williton district, except at corners where the view was obscured. He found that by approaching occupiers and owners they could generally be got to lower the hedges where it was required; but in all cases the council cut the sides of the hedges and cleared the stuff away.

Mr. T. G. CRUMP (Taunton Rural), seconding the vote of thanks, observed that the general public and the owners and occupiers were beginning to wake up to the fact that if hedges were kept low it meant a better and a cheaper road.

Mr. R. STEPHENS (Chard Rural) expressed the view that if the old Highway Act were properly carried out every occupier would be made to keep down his hedges adjoining the road.

Mr. E. STEAD (Somerset County) agreed that a road could be kept in much better condition and more economically if the hedges were cut down to a reasonable height. His belief was that a great deal more could be done by moral suasion than by the aid of the law. The stone which Mr. Durie had spoken of was one of fair quality, but it was not going to be satisfactory for a great number of years, and he hoped that Mr. Durie would not use too much of it as tar-macadam. Tar-macadam was not going to be the end of the road question, and it would have to be very carefully and scientifically used if the results were going to be anything like satisfactory. It was no use to make tar-macadam with weak stone, because it had not the resistance to crushing. The county council were laying down a tar-macadam portable plant near Long Ashton, and they were going to try what could be done with the Somersetshire limestone. He believed that the best Mendip stone would be found to have greater resistance to crushing than any of Mr. Durie's stone, and he should not advise him to use too much tar-macadam until he saw the result of the county council's experiments with the better class of stone.

Mr. J. JOHNSON (Keynsham Rural) said he could not understand any present-day surveyor advocating the contract system. It was just as reasonable to think that surveyors could make good surfaces with inferior material as that they could make roads with unskilled part-time contractors.

Mr. D. EDWARDS (Taunton), referring to a remark that the cost of hedge cutting should not be borne by the local authority, said he was not of that opinion, because it was the local authority who benefited by the road being properly looked after. There was no question, in his mind, as to the value of direct labour on roads. A road contractor, generally speaking, was half a road man and half a farmer, and he was bound to make money out of his contract. Naturally, he chose the easiest spot to get stone from the quarries, but this had a very detrimental effect on the roads.

Mr. DURIE, in replying, said the stumping of hedges was always avoided when possible. He thought the stone to which he had referred would be equal to the best-quality limestone in the county. He had a length on the Bridgwater road, made in 1906, which was frayed a little, but it had been there for eight years and was still very good.

WORKMEN'S DWELLINGS.

Mr. R. E. JACKMAN, sanitary surveyor to the Williton Rural District Council, afterwards addressed the meeting on the housing scheme which the local authority is proposing to carry out. Mr. Jackman said it was hoped that the scheme, inclusive of land, would not involve a cost of more than £200 per house.

Acock's Green Sewage Disposal Scheme.—The Birmingham, Tame and Rea District Drainage Board on Wednesday adopted a scheme of sewage disposal for the Acock's Green district, the estimated cost of which is £61,560.

Proposed Extension of Newcastle Tramways.—The Select Committee of the House of Lords on Wednesday ordered for third reading the Bill promoted by the Corporation of Newcastle-upon-Tyne for the provision of additional tramways in the urban districts of Longbenton and Westslade.

Assistants' and Students' Section.

All communications in regard to this page must be addressed to the Editor, St. Peter's House, 41 Bride Lane, Fleet Street, E.C. Questions must be written on one side of the paper only, and must be accompanied by the name and address of the sender. Answers to questions should be written on one side of the paper only, and must be accompanied by the name and address of the sender. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

QUESTIONS.

The attention of readers is invited to the following questions.

410. Removal of Sand Bar.—A certain stream [illegible] has become silted up, [illegible] by the formation of a sand bar 10 yds. by 10 yds., by 3 yrs. What steps should be taken to prevent a nuisance, and to ensure that the stream will be self-cleansing by the action of the tides? (Student.)

411. Foundations for Chimney Shaft.—What calculations are necessary for finding the width and [illegible] of the foundation of a square furnace chimney shaft, 150 ft. in height, on a gravel soil, and built in accordance with the London Building Act, 1894? (Student.)

412. Marine Surveying.—Describe a method for obtaining the direction and velocity of tidal currents.

414. Strength of Materials.—Prove the formulæ $\frac{M}{I} = \frac{f}{y}$ and $M = \frac{1}{R}$ with respect to beams, and explain the meaning of the symbols used.

415. Sewerage.—What conditions generally determine the adoption of either the "separate" or the "combined" system of sewerage in a town? (A. M. INST. C.E.)

416. Concrete Floor.—Give two sections of a reinforced concrete floor for a span of 30 ft., showing the sizes and weights of the girders, and giving the necessary calculations. (K. G. F., *Bradford*.)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

407. Surveying.—Describe a method of setting out circular curves by means of offsets. (M. C. E.)

First Method.

Let XX and YY be the two lengths of straight line required to be joined up by the curve. Construct XX, CE, Fig. 1, so that XC = 1 chain, bisecting

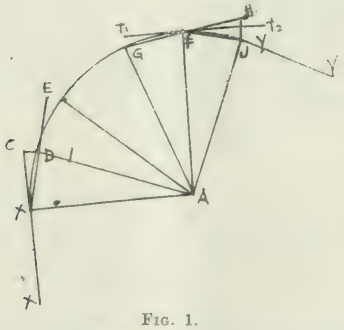

FIG. 1.

CE at right angles to mark the point C. A short wood lath is now used with a notch at either end, the distance between these notches is equal to the second and each succeeding offset to the curve. A notch midway between these two is cut. The distance between the first and middle notch represents the first offset to the curve. With the first notch on C, place the end of the chain on the springing of the curve at X, where the other end of the chain and the middle notch intersect is the first point (D) on the curve. Continue the chord XD to E, DE being equal to another chain, proceed in the same manner, but use now the full offset, or the distance between the extreme notches. Proceed in a similar manner till all the points on the curve are obtained.

Theory of the Method.

First Offset.—In Fig. 1 we will consider the curve between X and Y drawn. XC, XD = 1 chain, XA and DA are radii.

It is a well-known theorem in Euclid that the angle CXD = ½ the angle DAX.

$$\frac{CD}{XD} = \frac{XD}{2XA}, \text{ or } CD = \frac{XD^2}{2XA} \text{ or offset} = \frac{\text{chord}^2}{2 \times \text{radius}}$$

This is the equation for the first offset.

Let G, F, and J be further points on the curve. GF is a chord produced to H. GF = FH = FJ. HJ is the offset determining the position of the point J on the curve. Draw T, T_2 tangential to the curve at F.

Now $T_1FG = CXD$ (Fig. 1). A moment's consideration of the angles T_1FG, HFT_2, and T_2FJ will suffice to show that HFJ = $2T_1FG$, or 2 CKD the original angle.

$$\therefore HFJ = FAJ \text{ and } \frac{HJ}{FJ} = \frac{FJ}{JA}$$

$$\text{or } HJ = \frac{FJ^2}{JA} \text{ or offset} = \frac{\text{chord}^2}{\text{radius}}$$

This is the equation for the second and succeeding offsets.

Second Method. Or Method of Ordinates from a Chord.

As before, let XX and YY be the two lengths of straight line required to be joined by the curve. (Fig. 2.)

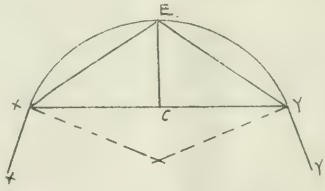

FIG. 2.

Set out the chord XY. The offsets could be set off directly from XY, or, if the offsets are too great, set out the versed sine CE and set off the chords EX, EY. From these two chords the ordinates can be set off as required.

The versed sine is obtained from the formula

$$V = R \sim \sqrt{R^2 - (\tfrac{1}{2}c)^2} \quad . \quad . \quad . \quad (1)$$

The ordinates are obtained from the formula

$$O = \sim \sqrt{R^2 - X^2} - (R \sim V) \quad . \quad . \quad . \quad . \quad (2)$$

where R = radius
C = chord
V = versed sine
O = ordinate
X = the distance of the ordinate from the centre of its chord.

(N. S. J.)

409. Road Construction.—Give a specification for the conversion of a macadam into a granite sett paved road suitable for heavy commercial traffic. ("Urban.")

The roadway to be excavated below the new surface level for an average depth of 13 in. The foundation for paving is to be made with Portland cement concrete, 6 to 1, 6 in. in thickness, and

finished off with the proper head and crossfall. All suitable macadam excavated may, after screening, be utilised as aggregate for the concrete. When the concrete has set it is to be covered with sand, gravel, or clean ashes, 2 in. in thickness. The roadway to be paved with granite setts 4 in. wide and 5 in. deep, from an approved quarry. The setts to be laid square, close and parallel, racked with limestone chippings, and well rammed; after which the joints are to be run with asphalt.

As regards the kind of granite setts to be used, I [illegible] will probably be to a large extent be guided by the cost of same delivered to his district. (Nottingham.)

413. Applied Mechanics. Sketch and describe a [illegible] and state for what purpose and how [illegible]

The Prony brake is what is known as an absorption dynamometer—*i.e.*, an instrument for measuring the torque exerted by a machine. In this form of dyamometer the work done by the torque is wasted by being converted into heat by means of friction. This instrument is used for testing small high-speed motors, for it will be seen later that it

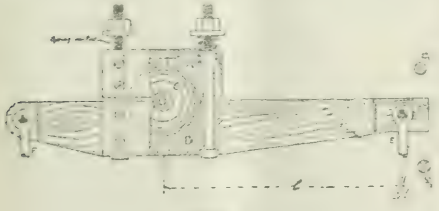

FIG. 1.

is an easy matter to calculate the horse power absorbed by the dynamometer, and this, by the conservation of energy, will be the horse power of the motor under test.

A simple but very successful form of the instrument is shown in Fig. 1 (elevation) and Fig. 2 (plan).

D is [illegible] the motor, keyed to [illegible] the small cast-iron pulley C. A and B are two wood blocks clamped together with bolts and nuts as shown, and the two blocks embrace the pulley. In order to keep the pressure between the blocks and the pulley constant the nuts work against springs which are recessed into the upper block A. The block B is [illegible] a form that it forms a two-armed lever with the shaft D (*i.e.*, pulley C) as the fulcrum. The load W on the brake is suspended from the rod E; while a weight is suspended from the rod F which just balances the unloaded brake.

S_1 and S_2 are stops which limit the motion of the lever. The lubrication of the brake is effected by

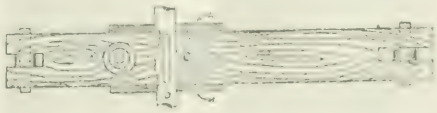

FIG. 2.

means of a stream of soapy water which enters at the top, is distributed over the surface of the pulley by grooves formed in the rubbing surfaces of the blocks, and leaves by the pipe at the bottom, and to prevent the water coming out at the sides wooden shrouds—L and M—are fitted to the sides of the blocks. The chief fault of this brake is that it is liable to violent oscillations, even when the torque is uniform, owing to the variations in the coefficient of friction between the blocks and the pulley. To obviate this defect a dash-pot is

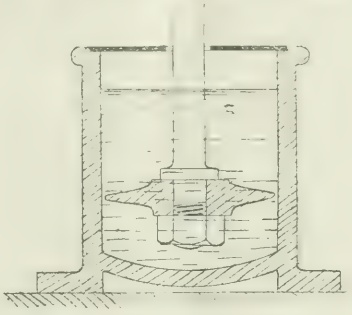

FIG. 3.

arranged, in which a piston fixed to the rod F works. The oscillations are thus damped considerably. Its action is that when the lever oscillates the amplitude of these oscillations are communicated to the piston (which should be thin at its edge, and be about $\frac{1}{8}$ in. smaller in diameter than the bore of the cylinder), but the motion of the piston is retarded by the liquid in the cylinder, a portion of which must move from one side of the piston to the other through the annular space between the piston and the cylinder. As shown, the cylinder is filled with oil or water; and the arrangement of the dash-pot is as shown in Fig. 3 (sectional elevation).

If l is the distance of the axis of the rod E from the axis of the shaft in feet.

W = load on rod in E in lbs. weight.

n = speed of shaft in revolutions per minute.

Then, horse power absorbed by the dynamometer is given by the expression—

$$\frac{\text{Work per minute}}{33{,}000} = \frac{2\pi \cdot W \cdot l \cdot n}{33{,}000}$$

Since all these quantities are known, the horse power is determinate; and it should be noted that neither the diameter of the pulley nor the coefficient of friction between the brake blocks and the pulley are required to be known. (T. W. P., *Bexhill-on-Sea.*)

Business Announcement.—As announced in our last issue, Claridge's Patent Asphalte Company, Limited, have opened an agency in Manchester in order to cope with the work in the North Midlands district. Their representative is Mr. E. J. Thompson, of 36 Spring-gardens, Manchester [illegible] Spring Chambers as we were advised in error last week.

CORRESPONDENCE.

Sir, though I would persuade, I'll not constrain
Your speech; speak freely is his own
Concerning anything, or anybody.
Massinger: "The Fatal Dowry," Act ii. 2

THE GUILDFORD SURVEYORSHIP.

To the Editor of The Surveyor.

Sir,—[illegible] with regard to the qualifications [illegible]

[illegible] all [illegible] the duties [illegible] and shall not engage in any other business [illegible] or undertaking, either by himself or in conjunction with any other person or person," [illegible] What time an officer will find for outside practice in the case of such conditions as these I am at a loss to imagine; I doubt if he will have even time for sleep.

That a corporation of the position of Guildford should deliberately set out to purchase a man, body and soul, is an alarming state of things—perhaps also a sign of the times. But it opens up a wider question than the mere self-respect of municipal surveyors which is attacked under these terms. There is the position of the consulting engineer and the profession of architecture to be considered. What chance will those men have of retaining their practice if borough engineers are to be expected to perform what is essentially specialists' work? It is neither just nor proper.

The advertisement states, too, that the candidate must be a member, or associate member, by examination of the Institution of Civil Engineers. Is that a measure of his ability to perform architectural work? Are there not other professional institutions more fitted to certify the abilities of municipal surveyors for their particular calling? What about the Surveyors' Institution, or the Institution of Municipal and County Engineers—a body whose diploma is regarded generally as being an indispensable qualification in the profession. Such a condition will, at least, exclude a number of excellent men, and the corporation will be well advised to amend the stipulation to accept an equivalent [illegible]

Yours, &c.,

Hydrant

PUBLIC SWIMMING BATH WATER: CONTINUOUS AERATION AND FILTRATION.

To the Editor of The Surveyor.

Sir,—My attention has been called to Mr. Lewis' criticism on my comments with reference to his paper read before the Institution of Water Engineers at their recent summer meeting, and which appeared in your issue of the 17th inst. In view of the widespread interest in this subject, and the possibility of the [illegible] being misunderstood, I venture to hope you will kindly publish these few further remarks thereon.

One might conclude from Mr. Lewis' criticism that I advocated dispensing entirely with aeration. This is not so, for I distinctly said that aeration was [illegible] part of the treatment, but I wished to emphasise the fact that chemical treatment was equally as important. My opinion has in this respect been very much strengthened by that of several medical experts, who have recently investigated this subject, and as a result strongly advocate chemical treatment and sterilisation of the water in addition to aeration and filtration, in order to obtain the best results. As to Mr. Lewis' remarks regarding the fatty impurities in the water coagulated by chemical treatment being a disadvantage, I am afraid I must disagree with him, as I look upon it as a decided advantage, and very necessary. It is the most efficient way to treat such impurities in order to be able to filter them out of the water, and if Mr. Lewis' experience is that coagulation [illegible] in the swimming pond to the extent he mentions, it must be due to improper treatment and attention.

I also [illegible] that Mr. Lewis [illegible] that chemical treatment involves the expenditure of [illegible] experience to the contrary. The chemicals used for the [illegible] are quickly washed out of the filter bed. As to cost, the chemicals used in the Turnover Filter Co.'s process only cost a few pounds per annum, a practically negligible amount.

I do not of course [illegible] that Mr. Lewis can use chemical treatment with their filters, but that Mr. Baldwin Bramwell was the first to [illegible] the system in connection with the continuous purification of swimming bath water, and that the "Turnover" filter is specially adaptable for use with such a system owing to the very efficient cleansing of the bed which is ensured by its use.—Yours, &c.,

Robt. A. Blakeborough.

Brighouse,
July 27, 1914.

IMPROVEMENT OF SEWAGE FARM LAND.

To the Editor of The Surveyor.

Sir,—In your last issue Mr. G. Bertram Hartree, the surveyor of Alton, Hants, referred to the statement made in "Things One Would Like to Know" as to the improvement of heavy soils in sewage farms by the addition of house refuse, and gave his experience, which corroborated my statement.

There can be no doubt that the addition of house refuse to a heavy soil containing a large quantity of hydrant silicates of alumina is affected chemically by the alkalis and carbons contained in the house refuse, and there is, in addition, the more important "mechanical" factor of tending to dry the soil and to break it up and render it lighter and more porous. The decomposition of the vegetable organic matter in the refuse seems also to have a very beneficial effect on a heavy soil.

The whole question is of great interest, and is worthy of experimental study by agricultural chemists.—Yours, &c.,

Your Contributor.

July 27, 1914.

ROAD BOARD RETURNS.

To the Editor of The Surveyor.

Sir,—I am a surveyor to a large but poor rural district council. These Road Board red herrings are causing me an enormous amount of extra labour and scheduling. I am not a philanthropist, but would willingly subscribe towards the printing if the Road Board would be humane enough to include in their exhaustive instructions that it is legal to remunerate surveyors for this extra work.

Take my poor council! They won't get a stiver! But they have just a faint hope; and I have to give up my half-day holiday *(pro tem.)* in consequence. I hate criticising, but feel a bit sore about it, so thought you might have another reader who would either agree with me or tell me off. I have always admired Mr. Maybury immensely, and feel sure he will remember us. I hope he will see this.—Yours, &c.,

Toad Under a Harrow de Luxe.

July 22, 1914.

ROAD TERMINOLOGY.

To the Editor of The Surveyor.

Sir,—As "Not so Dusty" has not seen his way to deposit the £25 in your hands, I have therefore laid certain information before you to show that I have "had 30 years' personal experience in refining bitumen for road paving" and that I "have anything else but a very limited knowledge of the manipulation of natural bitumen for road work outside the laboratory."

Further evidence, if necessary, is at your disposal, and I have taken this step to put an end to a personal discussion which has unfortunately drifted somewhat beyond the limits of "Road Terminology."—Yours, &c.,

Engineer.

July 27, 1914.

[We have only to add that the documents submitted to us make it perfectly clear that our correspondent has not put forward exaggerated claims in regard to his experience in the work to which he refers.—Ed. Surveyor.]

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Ammanford and Llandilo R.D.C.s (July 14th. Mr. F. M. Chamberlain).—£1,500 for the construction of a reinforced concrete bridge at Rhydcymerch, near Pantyffynon Station. The width of the bridge at that point has been usually left to the local population. The estimated cost is £3,500.

Brierley Hill U.D.C. (July 16th. Major J. Stewart).—£6,000 for the purchase of Brierley estate. The chairman of the Sanitary Committee, Mr. G. T. Lewis, stated that the council had entered into a provisional agreement with Mr. W. H. Foster, of Birmingham, for acquiring the estate, consisting of 38 acres of which only 12 acres were considered suitable for building purposes, and a considerable portion of the land might well be used for building workmen's houses, for which there was a great demand. All the available land in the district was already taken up. Dr. Lees and the surveyor, Mr. J. L. Harper, also gave evidence in support of the application.

Brixham U.D.C. (July 28th. Mr. H. A. Chapman).—£810 for the purchase of land and the erection of working-class dwellings.—It was stated that the site would provide accommodation for 42 houses with gardens at the rear, but the council only proposed to erect 16 at present. The houses would be erected in two blocks of six and one block of four, having frontages of 17 ft. each. Their accommodation would consist of three bedrooms, living room, scullery, and the usual offices. The estimated cost of each dwelling was £210, and it was calculated, if the houses let at 5s. per week, the council paying rates and taxes, that they would be self-supporting.

Chester T.C. (July 22nd. Mr. Edgar Dudley).—£2,910 for the purchase of property for the widening of Frodsham-street.—The street, it was stated, was one of the most important thoroughfares in the town, and already £12,000 had been spent on improving it. The property the council now proposed to purchase would enable them to complete the whole scheme and widen the road at the south end from 25 ft. 10 in. to 38 ft. 10 in., and the north end from 23 ft. to 30 ft. 4 in.

Evesham R.D.C. (July 15th. Mr. A. G. Drury).—£3,000 for a scheme for Harvington, near Evesham, under Part III. of the Housing of the Working Classes Act, 1890.—The clerk, Mr. E. H. Wadams, asked that the money for the purchase of the land (£750) should be repayable in eighty years, and that spent on the building (£2,650) in fifty years.

Guiseley U.D.C. (July 14th. Mr. A. W. Brightmore).—£3,700 for works of sewage disposal and surface water drainage. Mr. J. N. Nicholson, ASSOC.M. INST.C.E., Bradford, the engineer, explained the details of the scheme. There was no opposition, and Dr. Wilson, chief inspector of the West Riding Rivers Board, stated that, in his opinion, the scheme was a very good one.

Wallasey T.C. (July 23rd. Mr. F. H. Tulloch).—£1,570 for the widening of the north-east side of Breckroad; £2,075 for the widening of Claremont-road, south of Mayfield-road; and £997 for the provision of an 18 ft. public footpath from Warren-drive to Seaview-road.—The borough engineer and surveyor, Mr. W. H. Travers, explained the proposed works in detail.

APPLICATIONS FOR LOANS.

Barnet R.D.C.—£6,000 for the provision of workmen's dwellings.

Brighton T.C.—£5,350 for educational buildings.

Chester T.C.—£435 for street widening.

Doncaster R.D.C.—£3,550 for a water supply for Adwick-le-Street, and £2,300 for a supply for Askern.

Evesham R.D.C.—£2,500 for a water supply scheme.

Falmouth T.C.—£1,625 for paving, kerbing, and channelling works.

Hoylake U.D.C.—£900 for road widening.

Limerick T.C.—£25,000 for paving works with stone setts.

Shipley U.D.C.—£82,000 for workmen's dwellings.

Southend T.C.—£3,340 for gas retorts and buildings at Leigh, and £1,100 for underground conveniences.

LOANS SANCTIONED.

Brighton T.C. £13,200 for the provision of a playing field.

Belfast T.C. £1,130 for the Upper Falls sewage disposal scheme.

Bromley R.D.C. £5,11[illegible] for the West Wickham sewerage scheme.

Caerphilly U.D.C. £[illegible] for road works.

Cork T.C. £2,2[illegible] for machinery at the waterworks.

Evesham T.C. £1,800 (to be repaid in eighty years) for the purchase of land for the erection of workmen's dwellings.

Hendon U.D.C. £40,000 for extensions to the sewage outfall.

Hoylake U.D.C. £2,500 for laying out a recreation ground.

Islington B.C.—£5,316 for additional cooling towers at the electricity works.

Keith T.C.—£800 for the construction of a reservoir.

Llandudno U.D.C.—£13,000 for the provision of golf links.

Melton Mowbray U.D.C.—£700 for cemetery extension.

Radstock U.D.C.—£451 supplemental loan for the erection of forty houses.

Rotherham R.D.C. £[illegible] for works of sewerage.

Shildon U.D.C.—£550 for the extension of the recreation ground.

Tewkesbury T.C. £2,500 for a housing scheme.

Woolwich B.C. £20,295 for works of paving.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making information given under this head as complete and accurate as possible.*

BUILDINGS.

Birmingham T.C.—A scheme has been adopted for the extension of the law courts and police offices, at an estimated cost of £28,925. Alterations are to be effected at the Northwood-street baths, at an estimated cost of £1,132.

Brighton T.C.—The Special Aquarium Committee recommend that, in connection with the competition for designs for carrying out the proposed alterations and improvements to the Aquarium, a sum of 175 guineas be offered in premiums, and further that they should be authorised to appoint a professional assessor to advise as to the relative merits of the designs received at a fee not exceeding 50 guineas. The Finance Committee, having regard to the council's decision to invite competitive designs, recommend that the necessary addition to the estimate be sanctioned.

Denbigh T.C.—The tender of Messrs. Moreton & Browne, of Chester, at £8,955, has been accepted for the erection of a new town hall and market buildings, including clearing away the existing old buildings. The architects are Messrs. Brock, Elcock & Co., of Manchester.

Edinburgh T.C.—The Plans and Works Committee recommend the acceptance of an estimate, at £3,000, for the erection of wash-houses in McLeod-street.

Finsbury B.C.—The tender of Mr. W. Reason, at £1,279, has been accepted for alterations at the town hall.

Ilkeston T.C.—The Health Committee have received authority to prepare a scheme for the provision of a public swimming and washing baths.

Leicester T.C.—It was announced on Tuesday last that the Local Government Board had approved the scheme for a new tuberculosis sanatorium upon land adjoining the isolation hospital. The amount involved was £6,747 for buildings, and £3,000 for other works, and the work would be proceeded with at once.

Preston T.C.—It is proposed to build public baths in Saul-street, at an estimated cost of £20,000.

Southall-Norwood U.D.C.—The surveyor, Mr. Reginald Brown, has submitted various suggestions with regard to laying out the Manor House grounds, and last week it was agreed to adopt his proposition as to reserving certain parts of the estate for *al fresco* concerts to be held on Saturday evenings, the surveyor being instructed to make the necessary arrangements.

Ventnor U.D.C.—It has been decided to spend a further sum of £200 upon the improvement of the public conveniences.

Warwickshire C.C.—The Roads and Bridges Committee, it is understood, have decided to proceed with the reconstruction of a dangerous canal bridge on the main road between Bedworth and Bulkington.

West Sussex C.C.—The council have adopted the recommendation of the Finance Committee to establish the new county offices at Chichester.

Wrexham T.C.—The borough surveyor, Mr. J. England, has been directed to prepare a site plan of the proposed new town hall scheme.

HOUSING AND TOWN PLANNING.

Bowland R.D.C.—The surveyor, Mr. A. Burrow, has prepared plan and specification of cottages which it is proposed to erect at Gisburn, at an estimated cost of £1,400.

Bristol T.C.—The Health Committee have adopted a scheme for the provision of working-class dwellings. The report submitted stated that a suitable site would cost £6,800, the construction of roads and sewers £3,750, that the estimated cost of the proposed houses ranged from £175 per house to £218 per house, and that the total capital expenditure at Parson-street would be £28,544, and at Stapleton-road £20,510.

Hamilton T.C.—Workmen's dwellings are to be erected at an estimated cost of £3,200.

Hull T.C.—The Health Committee have sanctioned a scheme for the erection of 252 working-class dwellings in the New George-street area, at an estimated cost of £107,270.

Leicester T.C.—The Estates Committee have been authorised to prepare a scheme for the provision of workmen's houses.

Newcastle-on-Tyne T.C.—The council last week adopted the report of the Housing Committee recommending the erection of workmen's dwellings. It is proposed to erect at St. Lawrence 112 dwellings, consisting of eighty-four two-roomed dwellings, and twenty-eight three-roomed dwellings, and on land belonging to the corporation it was proposed to erect a further set of sixteen dwellings, consisting of eight two-roomed dwellings and eight three-roomed dwellings.

Southall-Norwood U.D.C.—With regard to the housing scheme alluded to last week, the council have agreed to the erection of twelve houses in Norwood-road and forty-two houses in Western-road, the work to be carried out by the surveyor, Mr. Reginald Brown, by direct labour.

PARKS AND OPEN SPACES.

Birmingham T.C.—The extension of Selly Park, at a cost of £1,800, has been approved.

West Bromwich T.C.—The Baths and Parks Committee recommend the council to purchase the land forming the entrance to Dartmouth Park, at present held on lease, for the sum of £650.

Wrexham T.C.—The borough surveyor, Mr. J. England, has received instructions to prepare a specification and invite tenders for the laying out of six tennis courts in the park, two of which are to be of asphalt.

ROADS AND MATERIALS.

Chesterfield T.C.—Following his gift of a public swimming bath, Alderman Markham has undertaken to construct a new road from Cemetery-hill, at the side of Wharton's foundry, across to Piccadilly, joining the new road towards Tapton, now being constructed by the Midland Railway Company. The Alderman will give the land for the road, metal it to 25 ft., leaving sufficient space for a 45-ft. road, and lay down the sewer. The council have accepted the gift with thanks.—It has been decided to make up Grove-street and Penmore-street, South Ward, and the borough surveyor, Mr. Vincent Smith, has been instructed to prepare plans for executing private street works in Tennyson-avenue.

Eastbourne R.D.C.—The Highways Committee report that they have received an estimate prepared by the district surveyor, in conjunction with the borough surveyor of Bexhill, Mr. G. Ball, of the probable cost of the proposed coast road. The total length in the rural district and in the borough of Bexhill would be 2 miles 920 yds. The total cost was estimated at £64,566, exclusive of the purchase of land and wayleaves, but the adoption of the shorter route would reduce the cost by £2,500. The committee passed a cordial vote of thanks to Mr. G. Ball and his assistants for the very valuable help they had rendered in the matter.

Inverness-shire C.C.—The Lochaber District Committee have agreed to accept an offer by the Road Board by which the board are to give £3,600 immediately, and £960 on loan without interest, to be paid in four annual instalments, on condition that the district council spend a total of £4,800 on the improvement of the Ballachulish road, and one or more outlying roads in the district.

Wandsworth B.C.—Having considered the question of providing more street refuges in different parts of

the borough, and obtained a report from the borough engineer, Mr. P. Dodd, on the subject. The Highways Committee recommended, that the council agree that temporary refuges be placed in certain places, with a view to permanent refuges being constructed there if the sites selected are found satisfactory.

Coventry T.C.—The council on Tuesday agreed to the scheme for the construction of new streets, and the improvement of narrow thoroughfares in the centre of the city, at an estimated cost of nearly £50,000. Parliamentary powers will have to be obtained.

East Sussex C.C.—The council have accepted a tender, at £32,074, for the improvement of the road from Lewes to Newhaven. Towards this expenditure the Road Board have sanctioned a grant of £17,610.

Hammersmith B.C.—The necessary loans having been sanctioned, it is proposed to expend £6,015 upon concrete foundations, and £8,062 upon creosoted wood paving work.

Kingswood U.D.C. It has been agreed to purchase from Messrs. Ellewellins & James, Bristol, a 250 gallon tar spraying machine, at £53 10s.

Lambeth B.C.—It has been agreed to carry out the following paving works: Lambeth Palace-road and Stangate, £4,487; South Lambeth-road, £8,275; Brixton-road (from Stockwell-road to Kennington Park-road), £13,282.—A petition has been received from thirty-seven householders in Croxted-road calling attention to the grave depreciation that is occurring in one of the best residential districts in the borough owing to the inability of the present surface of the carriageway of Croxted-road to withstand the heavy motor omnibus and other traffic passing over it. The houses in the road are suffering most seriously from vibration and disturbance, which could be vastly mitigated, if not entirely removed, by a reconstruction of the surface of the road. The petitioners have been informed that, having regard to the council's commitments for the present financial year, the reconstruction of the carriageway of this road cannot be considered prior to March 31st next.

Middlesbrough T.C.—The Streets Committee recommended that Newport-street be paved with soft wood blocks, at an estimated cost of £4,540.

Surrey C.C.—In a supplemental report the county surveyor (Mr. A. Dryland) states that the experience of the past year has confirmed the opinion he had before expressed as to the satisfactory results of the tarred slag road surfaces, the repairs to which had been trifling. For the fifth year in succession a census of the traffic on the Portsmouth-road at Kingston Hill had been taken on seven successive days in July, and the total number of vehicles and horses (led or ridden) was 18,727 compared with 14,963 in 1909. The number of motor cars and cycles had doubled, also the motor vans, while steam lorries had more than quadrupled. Motor omnibuses, which now appeared for the first time, numbered 1,235. Horse-drawn trade vehicles decreased from 1,974 to 522, but passenger vehicles increased from 776 to 1,103. Bicycles decreased from 6,129 to 4,094.

SEWERAGE AND SEWAGE DISPOSAL.

Bradford T.C.—The Sewerage Committee recommend the council to accept the tender of Messrs. Wm. Best & Sons, at £121,616, for the construction of the outfall sewer tunnel at Esholt.

Bury (Lancs) T.C.—The tender of Ames-Crosta Sanitary Engineering Company, Limited, 12 Victoria-street, Nottingham, has been accepted for the supply of their patent "Simplex" sewage distributors, for the percolating filters about to be constructed.

Canterbury T.C.—The corporation have accepted the tender of Adams-Hydraulics, Limited, of York, for the supply and erection of eleven of their patent "Cresset" distributors at the sewage disposal works. Mr. A. C. Turley, city surveyor, is engineer for the scheme.

Crediton U.D.C.—The Local Government Board having written asking what steps had been taken in connection with the proposed sewerage scheme, the council have decided to discuss the matter at the next meeting.

Doncaster R.D.C.—It has been decided to prepare a sewerage scheme for Barnborough.

Durham R.D.C.—In order to prevent future flooding the council have adopted proposals by the surveyor, Mr. G. Gregson, for sewerage extensions at High Pittington, at an estimated cost of £150.

East Ashford R.D.C.—Plans for a drainage scheme are being prepared by the surveyor, Mr. J. H. Wilde.

Folkestone T.C.—Messrs. Mansergh have received instructions to proceed with a sewerage scheme, the estimated cost of which is £29,000.

Handsworth U.D.C.—The council have accepted the tender of Ames Crosta Sanitary Engineering Company, Limited, of Nottingham, for the supply of their patent "Simplex" rotary sprinklers for their sewage disposal works extension.

Helmsley R.D.C.—A sewage disposal scheme for Gilling has been prepared by Messrs. Fairbank & Sons, of York.

St. Albans T.C.—A scheme for the sewering of the added areas has been prepared by Mr. H. Howard Humphreys. Part of it has been adopted, and the rest, dealing with surface-water drainage, has been referred back to the Urban Committee. The estimated cost of the sewerage scheme is £48,976.

Tyldesley (Lancs) U.D.C.—The council have placed an order for seven 80-ft. diameter Adams' patent "Adamic" airlock revolving sprinklers for the sewage works extensions.

Wandsworth B.C.—With a view to prevent storm flooding, the council have passed a resolution again urging the London County Council to extend the storm relief sewer in Balham High-road to the Falcon brook sewer.

Wirksworth U.D.C.—The council have accepted the estimate of Adams-Hydraulics, Limited, of York, for the supply and erection of three of their "Cresset" frictionless airlock sprinklers for the new sewage works. The engineer is Mr. H. Johnson, Bradford, and the contractors Messrs. Parker & Sharp, of York.

WATER, GAS, AND ELECTRICITY.

Brampton R.D.C.—The council have instructed Messrs. Taylor & Wallin, of Newcastle-on-Tyne, to prepare a scheme and report upon the water supply of Cumwhitton, Cumberland. Water will probably be obtained from springs by gravitation, and several miles of water mains will be required. This is the fifth scheme the Brampton Council have entrusted to Messrs. Taylor & Wallin.

Brighton T.C.—The Waterworks Committee submitted yesterday to the council a report from the waterworks engineer recommending the provision of an additional reservoir in connection with the Shoreham pumping station.

Chelmsford R.D.C.—It has been decided to prepare a scheme for a water supply at Great Baddow.

Cardiganshire C.C.—It has been agreed to make a complaint to the Local Government Board that the New Quay Urban District Council are in default in providing their district with an adequate water supply.

Evesham R.D.C.—The council have adopted a scheme which has been prepared by Messrs. Willcox & Raikes for the water supply of the populous portions of the parish of Harvington, the water being obtained upon terms from the mains of the Evesham and Pebworth Joint Water Committee. The present proposal is an extension of the Evesham villages water supply scheme.

Heckmondwike U.D.C.—Tenders are being obtained for laying a water main from near the Junction Inn to the reservoir gates, and the surveyor, Mr. J. Saville, has received instructions to complete the laying of a 4-in. water main in Chapel-lane.

Kidderminster R.D.C.—The surveyor, Mr. G. J. Shepherd, on Tuesday presented an estimate, at £439, for a water scheme for Churchill from the supply of the Stourbridge and District Water Board, and the council decided to seek the sanction of the Local Government Board to the scheme.

Kingsbridge R.D.C.—The tender of Messrs. Best Brothers, Teignmouth, at £416, has been accepted for the construction of works of water supply at Stokefleming.

Margam U.D.C.—Negotiations are going forward for the purchase of a site for the enlargement of the water storage to 160,000,000 gallons. The cost of the scheme is, approximately, £45,000.

Newport (Mon.) T.C.—The waterworks engineer, Mr. H. Tremelling, has prepared a report on the proposal to construct a new reservoir at Henllys, so as to meet the growing needs of the district. The proposed reser-

[illegible] will have a salary [illegible] of £2 a week, while the greatest [illegible] will be £3 a week. [illegible] will be [illegible] The total storage capacity will be 200,000,000 gallons. It is estimated that the daily quantity to waste at the [illegible] raised from 209,000,000 gallons to 1,197,000,000 gallons per [illegible] Mr. Hope [illegible] ought to [illegible] taining Parliamentary powers. It will be necessary [illegible] £120,000.

Penistone U.D.C.—The council have obtained a yield of water amounting to 7,500 gallons an hour from a borehole 300 ft. deep, and it has been decided to lay a water main 8 in. in diameter from the site of the [illegible] pump it was decided that Mr. Charles Chapman, of [illegible]

Penryn T.C.—It was reported last week that the council's special committee had met the committee of the Falmouth Town Council and had agreed that a letter be written to the Falmouth Waterworks Company inquiring upon what terms they would be disposed to sell their undertaking.

Saffron Walden T.C.—The tender of Messrs. Davey, Paxman & Co., of Colchester, at £347, has been accepted for a new boiler at the waterworks, and the tender of Messrs. W. Bell & Sons, at £21, for alterations necessitated by the new boiler to the structure [illegible]

Southam R.D.C.—A committee has been appointed to [illegible] a water supply for Hodnoy. —With respect to the boring operations for the Southam water supply, it was reported that satisfactory results had been obtained so far from the white rock at a distance of 2 ft., and the [illegible] further expenditure upon the works with a view to obtaining a [illegible] the Local Government Board.

Stafford T.C.—The council on Tuesday accepted the tender of the West Gas Improvement Company, at £17,473, for providing a Glover-West continuous system of vertical retorts, and £1,740 for the foundations, subject to the approval of the Local Government Board.

MISCELLANEOUS.

Barnes and Mortlake U.D.C.—It has been agreed to purchase a 60-ft. fire escape from Bayley, Limited, for £[illegible]

Housing Loans to Local Authorities.—In the House of Commons on Tuesday, Mr. Herbert Samuel stated, in reply to a question, that the amount of the loans advanced to the authorities of boroughs and urban districts under the Housing, Town Planning, &c., Act, 1909, was £1,529,909, the number of houses to be [illegible] being 9,501. To rural district authorities the [illegible] was £319,880 for 1,716 houses.

PERSONAL.

Mr. W. Granger Goode has been appointed [illegible] on the Loughborough Town Council.

Mr. W. W. Shennan, sanitary surveyor to the Wirral Rural District Council, has received an in[illegible]

Mr. J. H. Harris, of Chatham, has been appointed surveyor and inspector of nuisances to the Penryn Town Council.

Mr. G. Edwards, water engineer to the Leicester Corporation, was on Tuesday last voted an increase of salary from £450 to £600 a year.

Mr. Thomas G. Caink, borough engineer, King William's Town, South Africa, has been elected a member of the Royal Sanitary Institute.

Mr. Thomas Cole has been elected hon. secretary of the Institution of Municipal and County Engineers in succession to the late Mr. Charles Jones.

Mr. H. W. A. Carter, surveyor to the Matlock Bath Urban District Council, has received presentations from colleagues and friends on his retirement.

Mr. J. W. Stevens, surveyor to the North Walsham Urban District Council, has been voted £30 for his work in connection with the preparation of a sewerage scheme.

Mr. J. S. Pickering, the president, and Mr. W. Nisbet Blair have been appointed to represent the Institution of Municipal and County Engineers on the Organising Committee of the International Road Congress, 1915.

Mr. A. G. Wheeler, surveyor to the Eastwood (Notts) Urban District Council, has received a vote of thanks from the council for his energetic organising work in connection with the arrangements for the recent R[illegible] to the district.

Mr. Norris Sargent, M.Inst.C.E., borough engineer of Hackney, who has been discharging the duties of the town clerk for the past nine months, has received from the borough council a special grant of £200 guineas in respect of extra services.

Mr. A. Dryland, surveyor to the Surrey County Council, has had his salary increased to £1,000 a year from April 1st last, on the understanding that all fees received by him for extraneous services be paid into the county fund. It will be remembered that at the last meeting of the council it was decided that the honorarium of £52 10s. received from the Road Board by the county surveyor should be so paid, but at the same time it was referred to the Highways Committee to consider the question of increasing Mr. Dryland's salary.

Mr. W. E. Horsman, 127 Pendle-road, Streatham, for over thirty years representative of Messrs. George Waller & Son, Phœnix Ironworks, Stroud, makers of sanitary ironwork and appliances, and now in business on his own account, was presented recently by Mr. B. B. Waller, on behalf of the firm, with a handsome silver fruit stand as a souvenir. In making the presentation Mr. Waller enlarged in felicitous terms upon Mr. Horsman's business and social qualities, and at the same time presented a gold bracelet to Mrs. Horsman, and a parcel of interesting books, the gift of Mr. George Waller and Miss B. Waller, to Mr. Horsman's younger son.

Mr. Thomas Cook, city engineer of Worcester, a report by whom on the sewage disposal of that city appears on another page, commenced his professional career in the office of a land surveyor of extensive practice in the Midlands, and was engaged in surveys of large estates and parishes. He became assistant to the engineer of the Malvern Urban District Council, and afterwards surveyor and gas engineer to the Teignmouth Urban District Council. Ill-health of a member of his family necessitated his resigning the latter appointment. He afterwards became chief assistant to Mr. S. G. Purchas, M.Inst.C.E., city engineer to the Corporation of Worcester, who died in 1894, and whom he was unanimously elected to succeed.

Messrs. G. P. Robertson, municipal engineer, Darjeeling Municipality, Archibald James Ross, surveyor to the Lutterworth and Monks Kirby Rural District Council, George Edwards Crowter, engineer and surveyor to the Godstone Rural District Council, Bertie Morley, borough surveyor, Tenby, and Leonard Randerson, surveyor to the Strood Rural District Council, have been elected members; W. H. Jarvis, assistant surveyor to the Erith Urban District Council, an associate member, and G. E. Harwood, borough engineer's office, Accrington, and H. S. Lambert, borough engineer's office, Bridlington, students of the Institution of Municipal and County Engineers. Mr. T. S. Griffin, engineering assistant under the Wolverhampton Corporation, has been transferred from the class of student to that of associate member.

FOR OTHER ADVERTISEMENTS

See End of Paper.

HESTON AND ISLEWORTH URBAN DISTRICT COUNCIL.

SECOND ASSISTANT SURVEYOR.

The above Council are prepared to consider applications for the appointment of Second Assistant in the Engineer's and Surveyor's Department. The person to be appointed must be a good Draughtsman and Surveyor, and possess practical knowledge of the work of a Municipal Engineer's Office. Preference will be given to candidates who hold the diploma of the Institution of Municipal and County Engineers, and who have had experience in the preparation of Plans, Specifications, Estimates and Quantities. Age not to exceed 28 years. Salary £100 per annum,

...ering, subject to satisfactory service, by annual increments of £10 to a maximum of £120.

Applications, on Forms to be obtained from Mr. J. G. Carey, Assoc.M.Inst.C.E., Engineer and Surveyor, Council House, Hounslow, together with copies of three recent testimonials, to be sent to the undersigned not later than noon on Wednesday, the 12th August, 1914, endorsed "Second Assistant Surveyor."

Canvassing will be deemed a disqualification.

(By order)

H. J. BAKER,
Clerk to the Council.

Council House,
Hounslow.
30th July, 1914. (1,827)

URBAN DISTRICT COUNCIL OF FLEET, HANTS.

FLEET SEWERAGE AND SEWAGE DISPOSAL WORKS.

The Urban District Council of Fleet invite Tenders from responsible and experienced Contractors for the Construction of these works, which comprise about 16 miles of Stoneware and Cast-iron Sewers, Brick, Concrete, and Cast-iron Manholes, Flushing Tanks, Ventilating Shafts and Columns, Cast-iron Rising Mains, Air Mains, Engines, Compressors, Ejectors, Ejector Stations, Engine-houses, Balancing, Detritus, Sedimentation, Upward Flow, Storm and other Tanks, Percolating Filters, Humus Channels, Land for Storm-water Area, Roads, Paths, and other incidental works.

The Plans, Specification and a copy of the Specification, Quantities, and Form of Tender obtained, on and after the 20th July, 1914, at the Offices of the Council's Consulting Engineer, Mr. T. J. Moss-Flower, C.E., by appointment at 28 Victoria-street, Westminster, S.W., and at any time at Carlton Chambers, Bristol, on deposit of a £10 Bank of England note, which will be refunded provided a *bonâ-fide* Tender be received and is not withdrawn before the sealing by the Council of one of the Tenders, and provided also that all the documents supplied be returned to the Engineer.

On production of a receipt for the deposit a copy of the Plans may be inspected at the Council Offices, Fleet, on such days and at such times as will be communicated to firms tendering.

Sealed Tenders, endorsed "Tender for Fleet Sewerage and Sewage Disposal Works," are to be delivered at my Office at Fleet not later than 3 o'clock in the afternoon of Thursday, the 20th August, 1914.

The lowest or any Tender will not necessarily be accepted.

(By order)

W. H. WRIGHT,
Clerk to the Council.

Council Offices,
Fleet, Hants. (1,777)

BARNET URBAN DISTRICT COUNCIL.

TAR-MACADAM.

Tenders are invited for Providing and Laying Tar-macadam, in Wood-street, Barnet, of an average thickness of 4 in., and of a superficial area of about 5,400 super. yards, on the following terms:—

1. That the cost be spread over 18 months from completion of the work, in three equal payments.
2. That the work be guaranteed for 2 years, free of cost.
3. That the paving be maintained for an additional 3 years at a cost to be stated per yard super.

The Council will prepare the surface of the road for the reception of the Tar-macadam.

Full particulars can be obtained upon application to Mr. W. B. Chancellor, Engineer and Surveyor, No. 40 High-street, Barnet.

Quotations, endorsed "Tarmacadam," accompanied with a full description of the stone proposed to be used, together with samples of the same, in an untreated and treated state respectively, must be addressed to me and delivered at the Council Offices, No. 40 High-street, Barnet, on or before the 24th inst.

The lowest or any Tender will not necessarily be accepted.

H. W. POOLE,
Clerk of the Council.

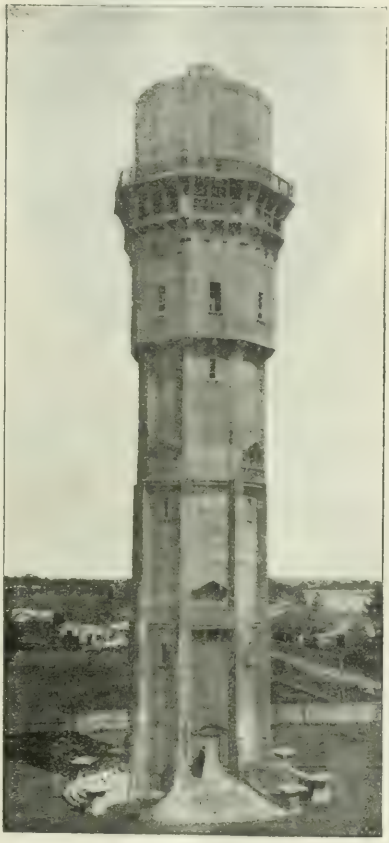
July 29, 1914. (1,828)

WATER TOWER, HAWERA, NEW ZEALAND.

The design of this tower is very interesting, as before it was built the town of Hawera had to depend on water mains alone for fire prevention purposes, and these had proved to be quite inadequate, a test showing that the pressure dropped from 59 to 18 lb. with only four leads of hose connected up. To remedy this (states the *Indented Bar Bulletin*) the council had the choice of duplicating the mains or building the tower, the latter course being finally decided on, as the estimated cost was less than one half of the first proposal.

The tower includes two tanks, the upper one having a capacity of 100,000 gallons and the lower one of half this amount. The internal diameter of the tower and lower tank is 25 ft., the internal diameter of the top tank is 30 ft., the height of the structure being 166 ft. to the top of the concrete. The highest level of the water is 153 ft. from the ground.

An official test showed that the pressure from the top tank, which is connected up by a 10-in. pipe, was



HAWERA WATER TOWER.

66 lb., and this fell to 51 lb. when the same four nozzles as were used from the mains were coupled on. Moreover, a further two additional nozzles can be connected without reducing this latter pressure.

Several storms and high winds have occurred since the tanks were filled, but there has been less than ¼ of an inch total settlement, so that the tower may be considered a great success.

In addition to the outside buttresses seen in the reproduction, a central octagonal column extends right up to the underside of the top tank.

Mr. J. C. Cameron, borough engineer, was responsible for the design and construction of this water tower, and he is to be heartily congratulated on the dignified appearance of this exceedingly useful building. Indented bars were used as reinforcement.

Worcester Sewage Disposal Works.*

By J. CAINE, Assoc. M.Inst.C.E.

mitted to their respective destinations.

The author's reasons for this view is that the longer the foul solids remain in contact with the water the fouler the latter becomes, and the greater demand is made upon the purifying arrangements to restore

Mr. J. CAINE, Assoc. M.Inst.C.E.

water to a condition in which the operations incident to its purification are less likely to be offensive to residents in the neighbourhood of the purification works, a consideration which will finally prove to be of paramount consideration.

The city of Worcester, which at the last census had a population of 47,987, is situated on the banks of the river Severn. It is 130 miles from the source of the river, measured along its course, and 60 miles from its estuary. The dead low summer daily flow of the river at Worcester is about 163,000,000 gallons, and the daily ordinary winter flow is estimated at 327,000,000 gallons; the width through the city averages about 200 ft., and the depth in the navigable channel 11 ft. The summer level of the river at Worcester, which is determined by the crest of the Diglis Weir, is 31·65 above ordnance datum. The highest flood level it has attained in recent times is 51·31 ordnance datum, to which it rose at Worcester Bridge on May 14, 1886. The general level of the land adjoining the river is 47·5 ordnance datum. A considerable number of small dwellings have their floor levels below 48 ordnance datum, and are therefore subject to flood. The general level of the city is about 78 ordnance datum, the highest point—viz., Elbury Hill—having an altitude of 317 ft. above sea level.

The river overflows its banks, on an average, about twice a year. The annual average rainfall of the district is about 25 in.

The city was sewered in 1858 on the combined system by the late Mr. Thomas Hawksley, past-president of the Institution of Civil Engineers. Into that system all the original sewers have been made to discharge. In about one-tenth of the city rain-water conduits have been laid diverting the water from the road surfaces to separate outfalls.

Before the construction of the disposal works the sewers had two main outfalls into the river on the left and right banks of the river, called Diglis and St. John's outfalls respectively, conveying the sewage from the portions of the city situated respectively

* Paper read at the annual meeting of the Institution of Municipal and County Engineers at Cheltenham

[illegible] has a population of about eight-ninths, and the latter one-ninth of the total. The outfall on the west bank was situated [illegible] Worcester Bridge not far from the centre of the city; that on the east bank is 800 yds. further down the river.

For the purpose of discontinuing the pollution of the river by the city sewage disposal works have been constructed on the west side at a distance below the the Diglis outfall of about 600 yds. A scheme of outfall sewers for the purpose of diverting the sewage from the old outfalls to the proposed disposal works was carried out by a firm of consulting engineers. From the St. John's outfall a cast-iron sewer 24 in. diameter, with manholes at intervals consisting of cast-iron square shafts 3 ft. 6 in. square, was laid running generally parallel to the river to the point where the new outfall sewer from the east side crossed the river at which, as originally constructed, it joined it. Storm overflow weirs are provided in the diverting chambers which come into operation when the pumping capacity at the works—which equals six times the dry-weather flow—is exceeded. In the walls of the overflow weirs and below the summer level of the river, sluice valves are built, through which river water can be admitted to the pipes conveying the sewage to the works.

Adjoining the chamber on the east side of the river at Diglis are two other chambers controlled by valves, from each of which a 20-in. cast-iron sewer descends vertically to a depth from the surface of 60 ft., and below the level of the river bed of 31 ft. These pipes enter and are laid along the concrete floor of a circular cast-iron tunnel 6 ft. 6 in. internal diameter, built in sections in its circumference, and bolted together in lengths longitudinally of 3 ft. The tunnel extends to the west bank of the river where the pipes terminated in two vertical shafts, each 4 ft. square, constructed of concrete, and enclosed within a circular cast-iron shaft 13 ft. 6 in. diameter. These concrete shafts had their outlets at a height of 36 ft. above the inverts of the 20-in. pipes into a chamber common to both from which a 36-in. cast-iron sewer extended, after being joined by the St. John's outfall sewer, to the disposal works at a gradient of $\frac{1}{855}$. This arrangement formed under the bed of the river an inverted syphon in duplicate. It was subsequently altered, as it was found that the velocity of flow up the vertical shafts was not sufficient to carry up the detritus and other solids of the sewage.

The difference of level between the floors of the chambers on the east and west sides of the river was 1 ft.; the maximum velocity, however, was determined by the difference of level between the height of the storm overflow weir and that of the water in the 36-in. sewer when conveying the maximum flow—viz., 12,000,000 gallons per day. . . The alteration of the arrangement consisted in abandoning the vertical shafts and uniting the two 20-in. pipes into one 24-in., and continuing it to the works with a descending gradient of 1 in 500, the depth of this pipe being generally about 52 ft. below the surface of the land. This pipe was laid in a tunnel, and as the material driven through was hard marl, not much difficulty was experienced beyond the rather large quantity of ground water that had to be negotiated. The 36-in. sewer was still retained for conveying the St. John's sewage which is discharged into the 24-in. sewer down a vertical pipe 20 in. diameter on the site of the works at a point where the sewer is increased to 26 in. diameter, and extends to the screen house (Plate 1). After entering the valve chamber (Plate 7) it divides by a Y branch, each controlled by a 26-in. valve, and enters the shafts containing the screens.

Owing to the depth of the sewer and the fact that the sewage rises in the pump well considerably above the level of the sewer, the screens are always submerged when in operation. The screens are cubical in shape, 5 ft. 3 in. by 4 ft. 10 in. by 6 ft. 6 in. high, and constructed of expanded steel upon angle steel framing, with a top of perforated steel. They sink to a depth of 63·5 ft. below floor of house in shafts 6 ft. 6 in. square. The shafts are constructed of blue brick in cement, and secured with steel bars 3 in. by $\frac{3}{8}$ in., riveted together to form complete rings of the same shape as the brickwork, partly rectangular and

partly semi-circular. The inner faces of the shafts are cement rendered. The open side of the screen next the inlet is placed close against the face of the wall, the other three sides are distant about 10 in. to permit of the free passage of the screened sewage to the outlet. The screens are raised and lowered by electric hoists with D.C. motors, 460 volts of 9-horse power each, carried on a traveller, by which the screens are removed on one side for cleaning. The entire arrangement is enclosed in a brick-built and slated house (Plate 6), 40 ft. by 19 ft. by 14 ft., to the wall plate. Stages approached by iron ladders are constructed in the valve chambers to give easy access to the valves when needed. The ground around the house was raised 9 ft. to place the floor above flood level.

The sewer on leaving the screen shafts extends to the detritus or pump well. This well is constructed at the north end of the engine-house (Plates 4 and 5), of which it forms a wing. It is circular in form, lined with blue Staffordshire bricks in cement, backed with cement concrete. It has a spiral staircase descending to the top of the cone, which constitutes the lower end of the well, and is approached from outside the building. The staircase is of granolithic, with one end of the steps built into the wall. The outer side is provided with an iron hand-rail.

The diameter of the well is 20 ft. to a depth of 30 ft., where it reduces to 14 ft., forming a gangway 3 ft. wide around the circumference. This reduction of the diameter was occasioned by having to increase the depth of the well consequent upon the laying of the deep sewer on the abandonment of the inverted syphon under the river, and was done to avoid undercutting the then existing masonry. For a height of 9 ft. 6 in. from the bottom the well is conical, the bottom of the cone leaving a diameter of 3 ft., the sides making an angle from the horizontal of 60 deg. The total depth of the detritus well is 84 ft. The well is covered over with steel joists in concrete, forming the floor of a store on a level with the engine-house floor—viz., 58 ordnance datum.

The sewer, which is at this point 26 in. diameter, enters the well at a depth of 71 ft. 6 in. from the top and 12 ft. 6 in. from the bottom, and is usually submerged to a depth of 47 ft.

A hydro-pneumatic sludge lift is fixed at the bottom of the cone (Plate 5), and rises vertically up the centre of the well discharging into wooden trough a distance of 140 yds. from the engine house. The detritus or sludge lift consists of 6-in. vertical cast-iron pipe, into the lower open end of which air is pumped, and is so far similar to the ordinary air lift. The object sought in the arrangement is to obtain an upward flow through the vertical pipe of a velocity sufficient to carry whatever heavy matter is carried into the well. In order, however, to secure that the water which is to convey the solids up the pipe is not obstructed by the accumulation of detritus around the mouth of the lift pipe, the pipe is surrounded by a larger pipe having a diameter of 15 ins., forming an annular space between the two. From this space a number of tubes are connected penetrating the accumulated matter near the mouth, and conveying the water lying above the detritus to the mouth of the lift. The air jet is covered with a loose glass ball resting on a cage to prevent the silt from entering the air pipe when not in use.

The trough into which the solid matter is discharged is 100 yds. long, and is laid along an embankment at the extreme north side of the works. It is 3 ft. wide and 15 ins. deep, and is divided longitudinally into two by a weir running its entire length, the trough

General Plan, Worcester Sewage Disposal Works. Plate 1.

into which the sludge is discharged being 2 ft. wide, and that for conveying the supernatant water to the sewer 1 ft. wide.

The detritus and lighter matter which are raised from the well by the air lift are automatically separated in the trough, the heavier matter being first deposited, then the lighter as the velocity of the water along the trough conveying it diminishes by overflowing the longitudinal weir on its way to the outfall sewer, by which it is returned to the well. The deposited matter is shovelled out of the trough on to the bank along which the trough is laid. In course of years the stuff will extend across a piece of land not otherwise used for the disposal of sewage. As the solid matter raised by the sludge lift is almost entirely of a non-putrifiable character, and is taken out very shortly after its arrival at the works, no nuisance from smell has been experienced.

The sludge lift is a very efficient appliance for raising such heavy material as sand, pebbles, pieces of coal, and the like, as well as lighter matter. Pebbles weighing three-quarters of a pound have been lifted from the bottom of the well, which is 85 ft. deep, and conveyed along the delivery pipe into the trough. The apparatus adopted is capable of lifting 20,000 gallons per hour from the bottom of the well containing one-fourth its volume of silt with a consumption of electricity in the air-compressor of 20 B.T. units

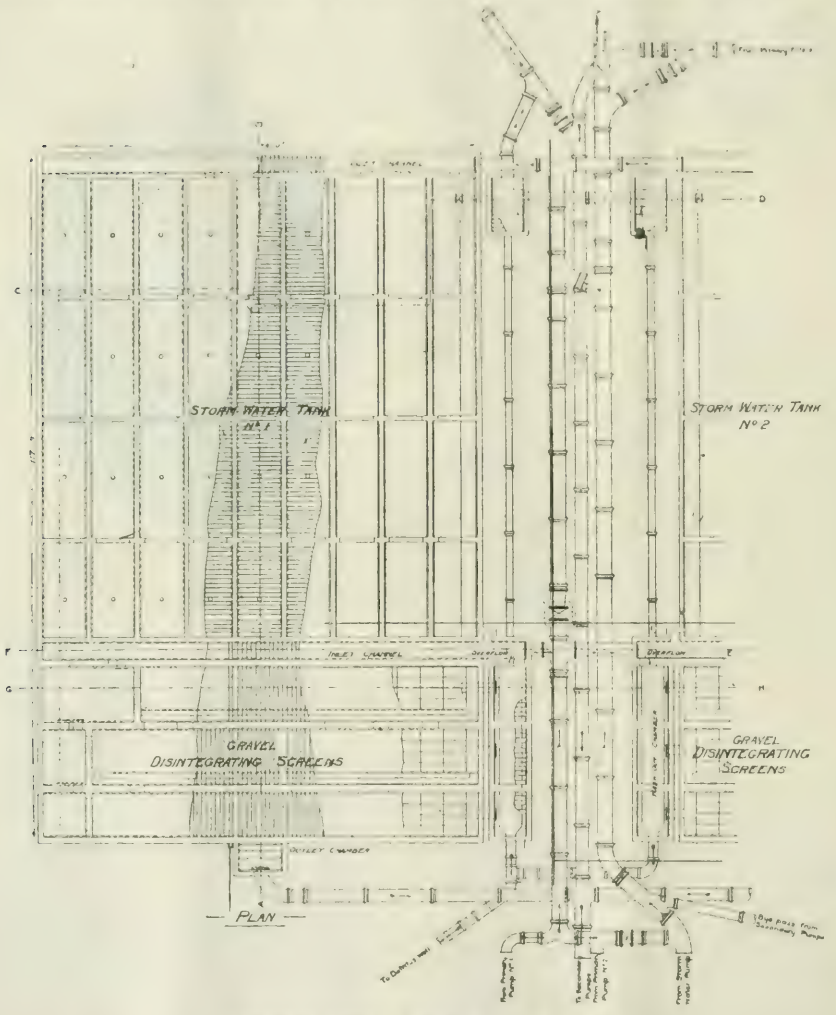
per hour. A vertical pitdle electrically driven Reo Rotative pump of a capacity of 25,000 gallons per min against a head of 80 ft. is fixed in the well with a D.C. motor of 25 h.p. resting upon the well coverings. This plant is provided for emptying the well when necessary.

The engine and pump house (Plate 4 and 5) adjoins the well. Its inside dimensions are 55 ft. by 40 ft. by 26 ft. to wall plate. It is partly built in red bricks with white joints on either inside or outside to decoration or costly material. A sunk chamber 44 ft. by 17 ft. by 24 ft. 6 in. deep is constructed lined with white glazed brick, for the purpose of placing the pumps at a suitable level for a moderate suction lift.

Below the floor of the sunk chamber is an arched

the dry-weather flow. Each of the two small pumps is electrically driven by a 45 h.p. D.C. motor coupled direct. The larger pumps are driven by belting from two Crossley gas engines, each developing 100 h.p., and fed with gas from Bowman's suction gas plants produced from anthracite. A gangway resting upon steel joists 12 in. by 6 in. bridges the sunk chamber from each gas engine for the double purpose of giving access to the fore part of the engine, and forming an abutment to resist vibration or displacement.

An overhead traveling crane of 6 tons capacity runs the full length of the engine house. The house also contains a Broom and Wade's air compressor of a capacity of 150 cubic ft. of free air per minute to 100 lb. pressure driven direct by a D.C. motor of



Worcester Sewage Disposal Works: Plate 2.

barrel extending the entire length of the house with the floor at 18 ordnance datum. From the pump well a 42-in. cast-iron suction main extends along the lower arched chamber, and from it branches are taken to the two primary and one storm water pumps. A benching carried upon arches is constructed in the sunk chamber upon which the two secondary pumps are bedded. The two primary pumps have capacities respectively of two million and four million gallons per day, and the secondary pumps exactly correspond.

The storm water pump has a capacity of six million gallons per day. As the dry-weather flow is taken at two million gallons per day, the total capacity of the raw sewage pumps is equal to six times

25 h.p. The compressed air is used for starting the gas engines, and for raising the sludge from the detritus well by the air lift. Two small stand-by air compressors are fixed in an adjoining room, one of a capacity of 55 cub. ft. of free air per minute to 30 lb., the other to 17 cub. ft. per minute to 80 lb. pressure, belt driven by a 12 h.p. D.C. motor. The latter machine is arranged also as an exhaust pump for priming the sewage pumps, and for exhausting the air from the syphons for starting the sewage sprinklers. An air receiver, consisting of a vertical cylinder 2 ft. 9 in. diameter by 8 ft. high, is lodged in an adjoining room used as a workshop, and a vessel of similar form and dimensions for the vacuum.

The primary pumps raise the sewage from the detri-

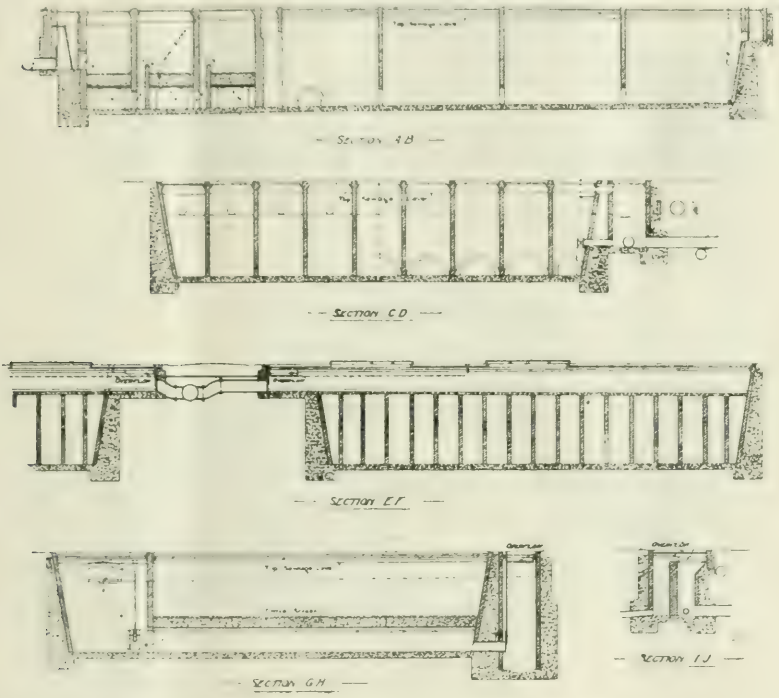
into well and discharge it into tanks in duplicate, which are used separately. Plates 2 and 3). The tanks are divided into three chambers, 60 ft. by 10 ft., 60 ft. by 10 ft., and 60 ft. by 8 ft. The maximum depth of water is 15 ft. A constant grade of 2 in. to the foot is fixed 4 ft. 3 in. above the tank floors. The grate carry a 6-in. layer of coarse gravel, upon which is spread a layer of fine gravel 18 in. thick.

The liquid is conveyed to the first gravel chamber along an inlet channel 3 ft. wide, which fills the entire length of the tank, which discharges into a channel which carries it through an orifice opening to the cast-iron grid carrying the gravel. The sewage then flows upwards through the gravel over a weir wall, round a baffle above the surface of the gravel, then downwards into the next chamber, under the gravel, and up through it, and so on with the third chamber carrying a similar arrangement of gravel, whence it is delivered to the engine house, where it is lifted by the secondary pumps to the distributing tower (Plate 1).

The transmission of the sewage upwards through the movements of the air due to varying levels of the upper water without the escape of putrefactive odours.

The tanks used for receiving the storm water were originally constructed as detention tanks, as required by the Local Government Board. They are in duplicate, each having a capacity of 50 times the dry-weather flow, and are used separately. They are divided longitudinally into bays 8 ft. wide by 9-in. walls carried to the surface. The total depth is 18 ft., the maximum depth of water 15 ft. Each bay has a separate inlet from one common channel running the full width of the tank (Plates 2 and 3), but having a water communication between them at the outlet end, so that there is no lateral pressure on the division walls. The tanks are roofed in with timber similar to that of the disintegrating screen chambers, and covered with sand. The storm water is decanted off to the effluent channel down to 4 ft. 6 in. above the tank floor, the remainder is returned to the pump well and treated as sewage.

The sewage, after passing through the series of



WORCESTER SEWAGE DISPOSAL WORKS. PLATE 3

...tanks, breaks up the putrescible matter in suspension into a fine state of sub-division before passing it to the distributors. The direction of flow through the gravel being upward there is no choking of the material by the arrested matter, the head of water being great enough to lift and loosen the gravel, and drive through it any material tending to obstruct the flow. The total water capacity of each tank is 172,000 gallons. When the twenty-ton gallon pump is running the sewage reaches the primary filters in about 2½ hours.

In consequence of the velocity of flow through the space under the gravel being reduced after leaving the inlet channel, a certain amount of suspended matter is deposited on the floors of the chambers. This deposit is removed daily by draining the water (when the pump is stopped discharging into it) back into the detritus well, and mixing it with the incoming liquid. This practice is important for preventing solid matter in any portion of the works from accumulating and becoming septic before reaching the oxidising filters.

The chambers containing the gravel disintegration screens are roofed with creosoted deal rebated planks 4 in. thick, and these are covered with a layer of sand 6 in. thick. This arrangement permits of the disintegrating screens, is returned to the engine-house and lifted by the secondary pumps to distributing tower, from which it is discharged under a maximum head of 10 ft. to the revolving distributors. This tower, which is circular in shape, is 20 ft. internal diameter. The depth of water 12 ft. It is constructed of blue brick in cement, armoured with complete rings of steel riveted together, laid edgeways in the brickwork, the distance increasing between the rings as the courses rise. Sufficient steel was built in to take the entire strain due to the pressure of the water, leaving the brickwork as the factor of safety. The interior is rendered with cement, making the structure watertight.

The author took advantage of this tower to obtain an inexpensive means of measuring the quantity of liquid treated upon the filters. The interior is divided into two chambers by a wall. In the upper part of the wall a 3-ft. gauge notch is built. A float with a spindle passing through the roof carrying a pointer moving in front of a scale indicates the quantity of water being discharged at any moment. A clock and drum recording the quantity throughout the twenty-four hours has not yet been provided. A cast-iron main conveys the liquid from

cement concrete 6 in. thick, and fall 1 ft. from the centre to circumference. Three-inch agricultural land drains are laid on the floor radially, with rows of Stiff's tiles at intervals. The outer ends of the drains discharge into an effluent channel surrounding the floor at the foot of the interior slope.

The filtering medium, which is 8 ft. deep, consists [illegible] from the excavations in the site of the filters, the remainder from other parts on the site of the works. The gravel is screened and washed, but not graded.

[illegible] filtering medium induced the author to attempt a means for getting air into the lower part of the material. Vertical pipes are provided standing 5 ft. high, surmounted by down draught cowls and connected to the effluent channel surrounding the bottom of the filter. These air pipes are 10 ft. apart around the filter, 60 to each bed.

The air is blown by the wind from any direction and diverted by the cowls down the pipes into the effluent channel, then along the drain pipes which convey the filtered effluent, and thence upward through the gravel meeting the liquid in its downward course to the drains. The effluent channel is air-trapped by a water-seal at its outlet to prevent the air finding an escape otherwise than through the gravel. With the view of making the down-draught cowls as efficient as possible, the author has designed a light aluminium automatic valve to prevent any portion of the air which enters the cowl at one opening from escaping at either of the others. They have not yet, however, been applied to them.

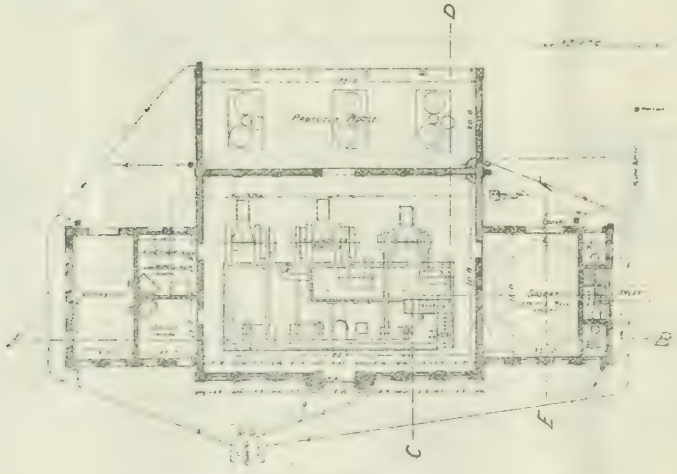
The distributors which supply the filters are of the revolving type, with single arms running on either steel or cast-iron rails resting on cement concrete tracks carried on concrete arches supported by piers of similar material carried down to the concrete floor [illegible] the filter. There are three tracks to each bed giving as many bearings to each arm. The distributors are syphon fed from cylindrical tanks at the centre 2 ft. 6 in. diameter, which receive the effluent from the lower end through 18-in. cast-iron pipes laid through the filtered material, and supported on concrete piers 12 ft. apart.

The ascending leg of the syphon feeding the distributor is suspended in the centre tank from the top of the descending leg, which passes down outside. The lower end of the descending leg is formed into an inverted syphon in the middle of which is a reflux valve, which opens outwards from the centre. The purpose [illegible] syphon when exhausting it to start the distributor. From the inverted syphon the arm extends for a length of 95 ft. from the centre — that is, within 5 ft. of the perimeter of the filter. The distributor pipe is 10 in. diameter at the ascending [illegible] 5 in. at the other extremity. The jets which are spraying jets similar [illegible] patented by the author for the distributors of watering carts, are spaced so as to deliver equal quantities of liquid over equal areas throughout the entire length of the arm. The two sprinkling jets are 5-16ths in. diameter. There are 200 jets in each distributor, which, with a 5-ft. head, discharge on to each bed 1,000,000 gallons in twenty-four hours.

The effect of the spraying jets is to cover every part of the surface of the bed with liquid. One result of this is to destroy the larvæ of the innumerable flies that infest the surface of bacteria beds, and quite prevent the nuisance arising from that phenomenon. Another result of breaking up the liquid into a fine spray—a less fortunate one—is that foul odours from the liquid are likely to be conveyed to greater distances than if discharged from the arms in unbroken streams, and, as already has been said, the question of offensive odours will finally be the paramount consideration. Means must be provided for dealing with the offence when experience suggests it is likely to occur.

After reducing the period of transmission of the foul liquid to the shortest possible time, the question of odour becomes one of dilution, dilution of horse-

Elevation.

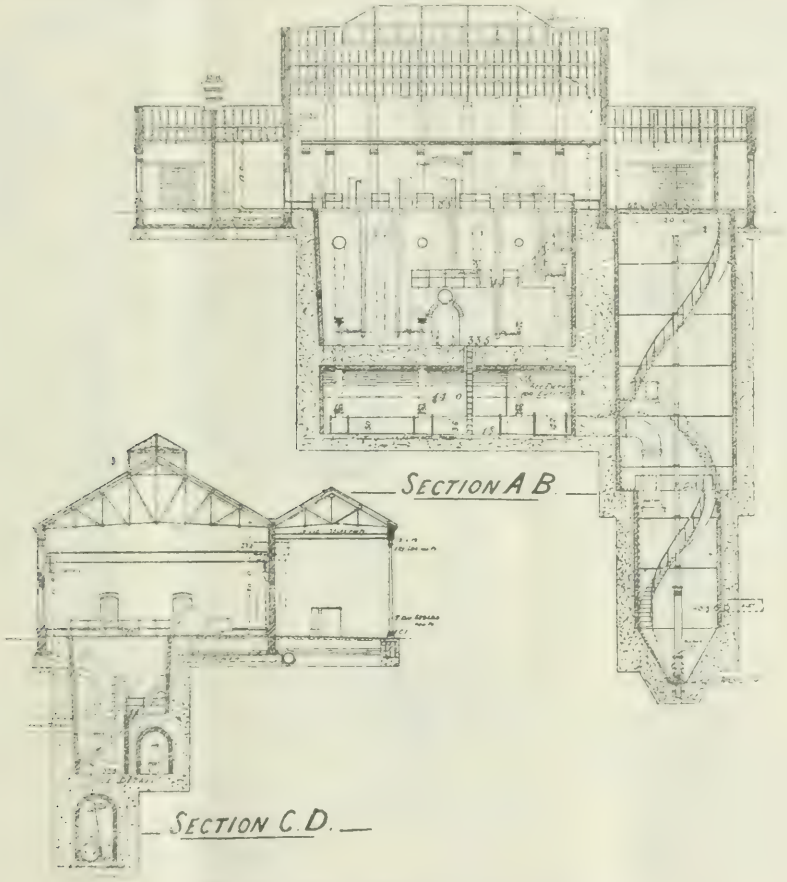


Engine House.

Worcester Sewage Disposal Works Plate I

power ... [illegible] ... dilution ... required ... [illegible] ... the filters ... [illegible] ... Dilution ... [illegible] ... the river through 20-in. valves built in the weir walls ... water passing therefrom to the outfall sewers. The degree of dilution is constantly changing, the quantity of river water being always the difference between the volume of sewage and the capacity of the pump then in use, which is allowed to run at its full load. ... [illegible] ... float valve is fixed at its upper end, which closes ... [illegible] ... the pipe.

The distributor arms are borne at three points ... [illegible] ... tandem. The axles of these wheels run under anti-friction rollers, the axles of which are carried upon ball bearings, the object of the arrangement, of course, being to reduce friction to a minimum. These three pairs of carriages run upon concentric rails 7 ft., 80 ft., and 150 ft. diameter respectively, the outer ends overhanging the outer carriage cantilever fashion a distance of 15 ft. These distributors are almost identical in form with that which formed the subject of the author's patent taken out as far back as 1897, and which he thinks was the father of all the self-propelled sewage distributors which



WORCESTER SEWAGE DISPOSAL WORKS: PLATE 5.

the capacity of the pump, the sewage would flow through the valve into the river. It is therefore necessary that the level of the water in the river should always be higher than that in the mixing-chamber. To indicate whether such is the case gauges showing the height of the sewage and of the river are provided in the engine house, and these determine the pumps which are required to run.

In order to [illegible] distributors under easy control an arrangement is provided for doing this from the engine house. From the vacuum vessel already mentioned a 1-in. diameter air-pipe is taken to each filter and fixed up the centre of the ascending leg of the distributor. To start the sprinkler the pipe is opened to the vacuum when the air from the syphon is exhausted and the distributor started. To stop it, the pipe is opened to the atmosphere.

In order to prevent water being drawn into the air-pipe when exhausting the syphon for starting, a

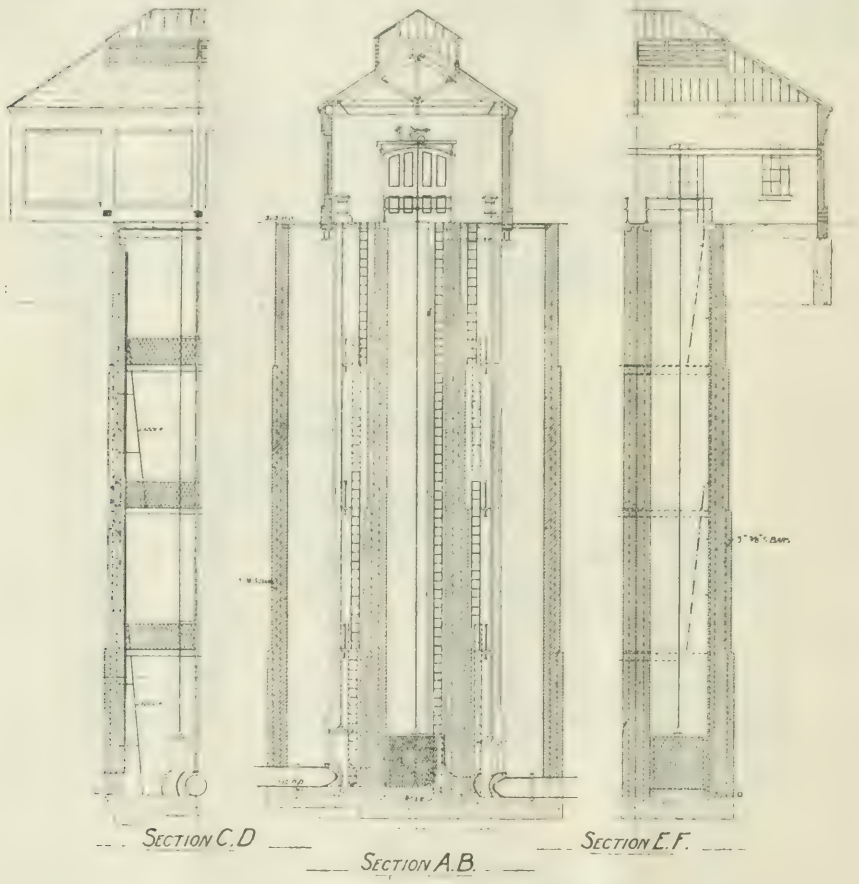
have been since introduced. The running of the distributors has shown that the anti-friction arrangements were needlessly over-elaborated. Wheels carried by simple ball-bearing axles would have amply sufficed.

It requires, of course, more power to overcome what has been called the stiction and inertia at starting than is needed to keep the arms running at a moderate speed. The consequence of this was that the distributors were found to reach a rather alarming speed after running for a short time, making a complete revolution of the 200 ft. diameter bed in thirty seconds. The author desired that they should make a revolution in about five minutes; he accordingly designed a form of brake for reducing as well as regulating the speed. It consists of a double fan of eight vanes of galvanised iron, the vanes measuring 9 in. by 6 in. The fan spindle is geared to the outer carriage wheels, which gives it rotation when the arm is moving. The resistance of the air to the rotation

[illegible] per minute. The air resistance varies at the square [illegible] velocity. The speed of revolution of the distributors can be altered by changing the angle at which the vanes strike the air.

The filtrate from the oxidising filters passes to the secondary filters. These are five in number (Plates 1 and 8), four of them 198 ft. sq., the fifth 198 by 175 ft., and have a total area of 2·06 acres. They are formed in excavation and embankment, are not enclosed in masonry, and have no paved floor. The filtering material is sand 3 ft. thick, screened from [illegible] primary filters, [illegible] primary effluent through the secondary filters, it can be allowed to overflow direct to the outlet pipes in the carrier.

There is an area of about 17 acres which the Local Government Board required to be provided for irrigation; the effluent carrier entirely encompasses this land. Its dimensions are 3 ft. wide by 3 ft. 3 in. deep. The invert is of cement concrete, and the side wall of Staffordshire bricks in cement 9 in. thick. The wall next the irrigation land is 9 in. lower than the outer wall, so as to permit the effluent to flow over into the land. The effluent outfall discharges into the river a short distance below Diglis weir, and above the summer level of the river at that point.



WORCESTER SEWAGE DISPOSAL WORKS PLATE 6.

on a bed of gravel 1 ft. thick. They are under-drained by 3-in. agricultural drain pipes, which discharge into a brick channel running along the middle of the bed from inlet to outlet. A barrier composed of sand and gravel runs across each bed, dividing it into two parts, that nearest the inlet being one-third, and that next the outlet two-thirds of the area. The object of the barriers is to cause as much as possible of the humus carried from the primary filters to be deposited on the smaller areas, leaving the larger portions to allow the primary filtrate to pass through the sand.

Overflows are provided with bell-mouths standing about 15 in. above the sand surface. The outlet pipes, which are fixed in the final effluent channel, are raised so as to keep the secondary beds full and flooded as in waterworks' filters, valves, however, being fixed at the foot of the outlet pipes for draining the filters. The filtrate falls from the outlet pipes in cascades into the carrier. If it is thought unnecessary to pass the whole or any part of the It flows from a 3 ft. diameter brick culvert down a series of white glazed brick steps into the river.

The following is a summary of the cost of the works:

	£	s.	d.
Land	9,598	0	0
Screen-house and substructure	3,442	0	0
Outfall sewers, including tunnel	22,873	0	0
Screens and hoist	640	0	0
Pumping station and detritus well	8,635	0	0
Sludge lift, delivery main and depositing trough	352	0	0
Pumping machinery, air compressor and gas plant	4,922	0	0
Storm tanks, disintegrating gravel screens, valves	9,062	0	0
Conduits and valves	7,176	0	0
Distributing tower	310	0	0
Primary and secondary filters	30,306	0	0
Rotating distributors (Candy-Cainck)	2,475	0	0
Effluent channel and outfall to river	3,990	0	0
Compensation and wayleaves	1,318	0	0
Engineering, legal, miscellaneous expenses	8,609	0	0
Total	£118,708	0	0

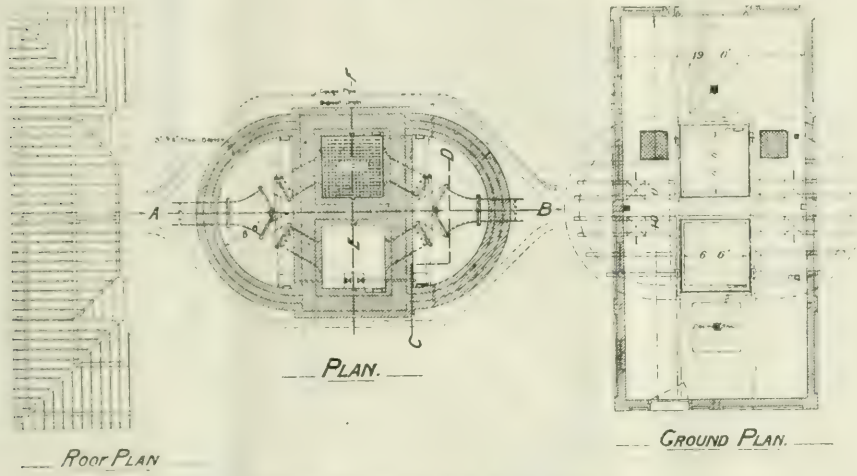
It will have been noticed that a prominent feature

of this scheme is the absence of tanks for detaining the sewage prior to its transmission to the existing filters, the aim being to avoid having to deal with sewage sludge as sewage sludge until it had undergone sufficient digestion to render it innocuous. It was obvious that the adoption of such a practice would have the effect of choking the primary filters much sooner than would be the case if the organic solids were deposited in tanks. It was therefore necessary to provide facilities for the washing from the gravel the digested solids. Arrangements were accordingly provided for reversing the flow of sewage in the filters, converting the outlets into inlets, and inlets into outlets, and sending the liquid upwards through the filtering material so as to wash the gravel with the upward flow filtered effluent, passing it on to the land for the washings to settle, and the water to pass into the river.

It was found that after the filters had been in use about four months the upper layer of gravel to a depth of about 12 ins. was charged with sufficient solid matter to prevent the free passage of the liquid from the distributors at a rate equal to the capacity of the bed, and the author proceeded to wash the top layer of gravel by the upward flow filtered effluent. As nearly as an estimate of the cost of washing the

the contributed day by day displacing upwards what has previously been intercepted. That process will doubtless continue until that which was first arrested becomes, by the force of the upward flow of the water, discharged at the surface. A state of equilibrium will then be reached; that is, the solids will be discharged at the surface at the same rate as they are deposited beneath, less what disappears by conversion into liquids and gases consequent upon the biochemical changes they have undergone during their slow upward transmission through the filter. By that time the solids will doubtless have become converted into an innocuous humus.

The process is intended to be amplified by passing the filtrate to the under drains of the secondary sand beds already described and filtering it upwards slowly through these beds. By keeping the outlets from these beds from 12 to 15 in. above the sand a sufficiently slow movement will be imparted to the water to allow the suspended matter which will be forced through the sand to settle down upon its surface, while the water, freed from suspended matter, will pass to the final effluent outfall. By drawing off the water from the beds, the precipitated matter which, after a little exposure to the air is converted into a hard cake, can be easily handled and removed with scarcely



Worcester Sewage Disposal Works. Plate 7.

gravel could be made, it would seem to amount to about £500 a year.

The operation of cleaning the gravel by this means induced the author to conduct some observations on upward slow filtration through the gravel as a normal method of sewage purification adhering to the lines already adopted in this scheme of physical disintegration of the solids through the gravel screens and quick separation of the liquid from the solids in the primary filters aided by dilution of fresh water from the river, which is always nearly saturated with oxygen.

If a satisfactory effluent could continue to be obtained by these operations, it was not difficult to see that with a single sweep practically all the problems which had troubled engineers for the past generation would be solved, and the cost of sewage purification reduced to a minimum.

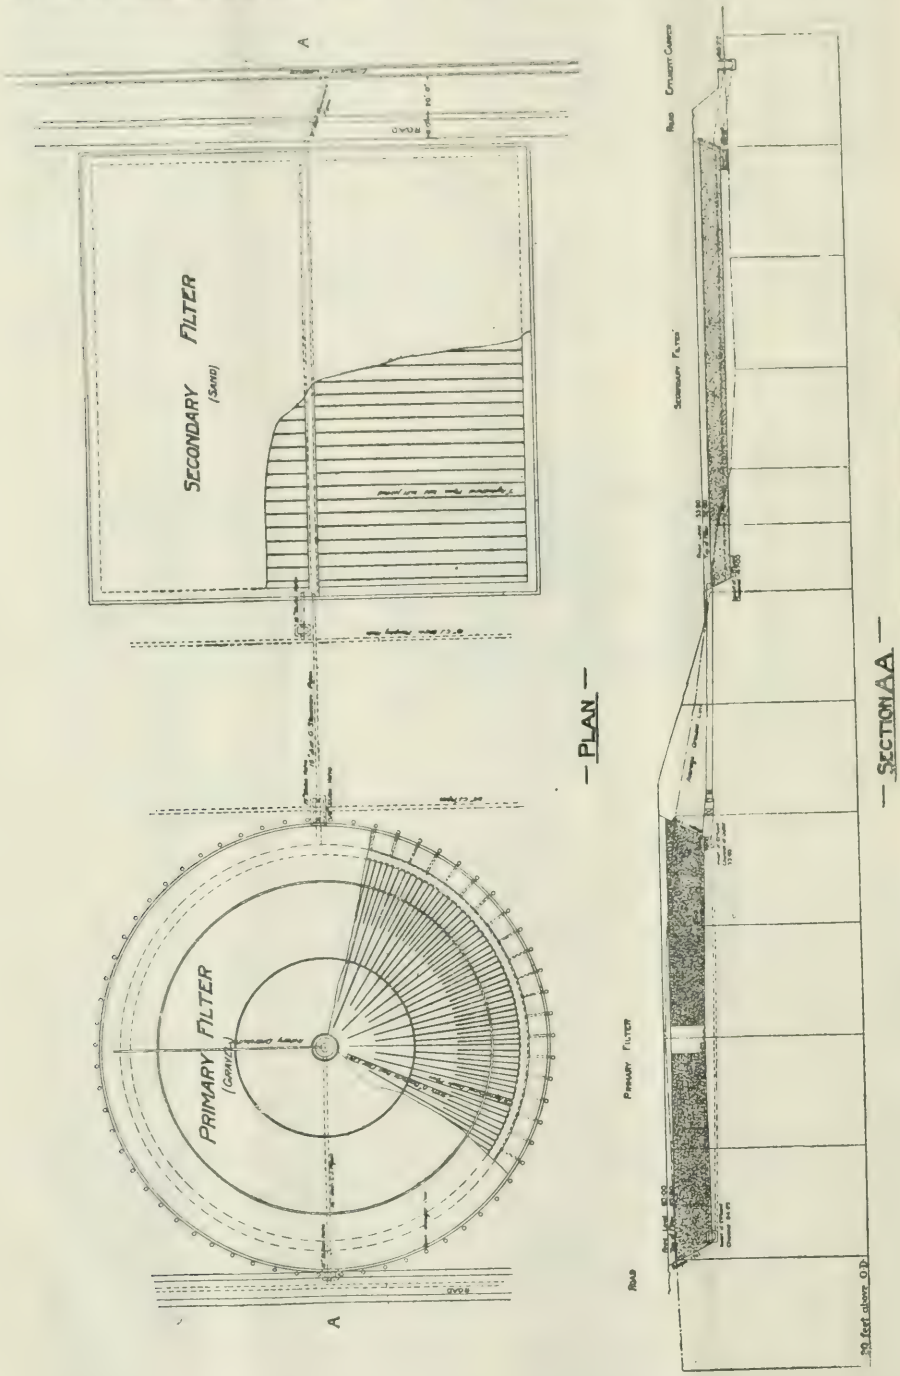
The aerial nuisance would be disposed of, because the liquid would not appear until it had been so far purified by its passage upwards through the filter. The fly nuisance could not exist, because the larvæ as soon as deposited would be carried away by the surface flow, and the most important and difficult of all, viz., the sludge problem, would seem to be easily and satisfactorily solved.

What was likely to happen and apparently is happening, is that after the putrifiable and such other organic solids have been broken up into a finely divided state in the disintegrating screens, they pass on with the liquid from the secondary pumps through under drains into the lower strata of the primary filters where they are immediately arrested, while the water passes away from them upwards. More solids

any interference with the sand surface, and will, I think, prove a valuable and saleable fertiliser, particularly if ground to powder.

A small amount of consideration will suffice to see that the operations described are almost exactly the inversion of the processes going on in the human body. Pure liquids and solids are introduced in the upper regions then pass downwards, undergoing certain natural digestive processes, and emerge fouled from the lower regions. There is one very important feature, however, of the analogy lacking. In the operations of the sewage purification described no certain and measurable provision is made for supplying oxygen to the filters, so as to carry on the process with a maximum efficiency such as respiration affords in the human economy. The author's view is that air should be pumped into the mains which convey the sewage to the primary filters and the mixture passed into the filters. By this arrangement a maximum of contact between the air, the water, and the filtering medium would be secured. The proper proportion of air to water would be matter for determination by experience, and it may be presumed would largely depend upon the strength of the sewage. This method of treatment would emphasise what is generally recognised, that modern sewage purification is the application of natural processes accelerated by artificial devices, or in other words, "intensive cultivation."

It is not difficult to see that this system of purification would involve a minimum of capital expenditure, dispensing as it would with large detention tanks, all forms of distributors, with the consequent dispensing of labour in keeping them clear, no labour



PRIMARY AND SECONDARY FILTERS, WORCESTER SEWAGE DISPOSAL WORKS: PLATE 8.

various parts of the works. The conclusion from these considerations is that the cost of sewage purification will, like most manufacturing and other physical operations, become one of horse-power rather than of large capital outlay. A very large quantity of water

tion and that of sewage, indicating that the former is best effected by downward filtration, the latter by upward. The ordinary purification of water for public supplies consists almost entirely in removing the matters in suspension, whether mineral, dead organic,

of laying organic matter with chalk lime, the more expert the fitter in making the latter to the work required. In the case of sewage, it is not usually advisable, as the matter in suspension will be retarded and the cleaning of the filter-beds and pipes will be more difficult. It is well to treat of the liquid itself, and a little practice will soon enable the operator to determine when to effect the cleaning, which should be done as soon as the effluent begins to show signs of becoming foul. If the latter is allowed to remain on the surface it becomes impervious and impervious, whereas by upward flow the bed is kept loose and open, so that still both the surface, the liquid passes freely through the bed slowly.

NORTHANTS AND EAST MIDLANDS SURVEYORS' ASSOCIATION.

A motor tour and visit to Peterborough and district on the occasion of the Agricultural Show was made by members of the above association recently. There were [illegible] Messrs. Chas. S. Mawer (county surveyor), J. B. Williams (borough surveyor), Dawson, W. Mather, and F. Cleaver, county surveyors; also N. L. Dixon, Oundle Rural; G. B. Chilvers, Oundle Urban; Thos. Lake, Bourne Rural; John Bailey, Spalding Urban; Messrs. Clowes and Peswell, the Peterborough Rural surveyors; J. W. Walton, Peterborough city surveyor; T. Lloyd Thrapston Rural; Mr. Millner, Blisworth; and others; making up a total of about twenty, with the secretary (Mr. Walton Maughan).

The first stop on the tour was for the inspection of the Carnegie county road work now in progress and one of the county's main trunk roads, especially as these are subject to motor-bus traffic. In Wilby village sections of tarvia macadam which had been down for four and three years respectively without showing any appreciable sign of wear were inspected.

The party later proceeded to the North Bridge, where the county surveyor conducted them over the works and explained numerous details of this important contract. The bridge is over 300 yds. long, and the total cost will probably be in the neighbourhood of £10,000. A straight run was then made to Peterborough, and thence to the Show ground, where the party, together with those members joining at Peterborough, were entertained to luncheon by the ex-mayor, Mr. J. G. Barford, and Mr. J. E. S. Perkins, representing the well-known firm of Barford & Perkins, who had several of the latest types of motor rollers among their exhibits.

Tea was arranged for the members through the kindness of the mayoress, Lady Winfrey.

Trade Note.—Messrs. Wailes, Dove & Co., Limited, of Newcastle-on-Tyne, have applied their "Bitumastic" solution to the suction inlet and make-up pipes and other steelwork in connection with the pumping plant for the new entrance lock at Alexandra Dock, Newport, recently opened by Prince Arthur of Connaught.

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangements well suited for easy reference.—*The Law Times.*

Talbot Cars. The Talbot total of highest awards this year now amounts to seventy, which easily exceeds their aggregate for the whole of the 1913 season. This is an exceptionally fine record when it is remembered that a considerable share of them have been won by amateur owner-drivers of Talbot cars, while the remaining wins in trade events have fallen to demonstration cars entered by the Talbot Company in accordance with their usual policy of relying exclusively upon tuned-up cars of precisely similar design to their touring chassis, whereby the Talbot successes become of relevant value in appraising the capabilities of the Talbot car for arduous road service.

* A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities. By S. G. Turner, of the Middle Temple, Barrister-at-Law, A.M.I.C.E., &c. London: St. Bride's Press, Limited. Price 10s. 6d.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President Mr J. S. PICKERING, M.I.C.E.E. Borough Surveyor and Water Engineer, Cheltenham.

CLEETHORPES MEETING.

A meeting of the institution will be held at Cleethorpes on September 19th.

SCARBOROUGH MEETING.

A meeting of the institution in the North-Eastern District will take place on Saturday, September 26th, at Scarborough.

J. W. DUDLEY ROBINSON, B.SC.(LOND.),
Secretary

92 Victoria-street,
Westminster, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

President Mr HORACE BOOT, M.I.E.E., M.I.MECH.E.

COUNCIL MEETING.

At a meeting of the Council held on Tuesday, 22nd July the following applicants were recommended for election:

To Membership.—Messrs. H. J. Stiles, borough surveyor, St. Ives, Hunts; Anthony Dorin, surveyor and engineer, Seaton Delaval Urban District Council; C. G. Grey, shire engineer, Abercrombie, N.S.W.; B. H. Tuck, city engineer and surveyor, Unley, South Australia; J. Hodgson, town surveyor, Kensington and Norwood, South Australia; D. C. Smith, assistant engineer, Kalgoorlie Municipality, Western Australia; W. M. Pullar, city surveyor, Essendon, Victoria; H. E. Coane, municipal consulting engineer, Melbourne; O. J. Burt, municipal engineer, Port Pirie Municipality, Australia; A. K. T. Sambell, municipal consulting engineer, Melbourne; F. Thompson, electrical engineer, Claremont Municipality, Western Australia; and S. T. Ford, surveyor, Camelford Rural District Council.

To Associate Membership.—Messrs. P. J. Williams, architect, Shipley Urban District Council; C. N. Butler, assistant surveyor, Tisbury Rural District Council; A. S. Northover, assistant surveyor, Tisbury Rural District Council; and S. K. Gibson, highway surveyor, Cockermouth Rural District Council.

Under the new by-laws these elections will be ratified at the next council meeting if no written objections are lodged within 14 days.

Elected to Studentship.—Mr. G. Fetcher, surveyor's office, Ammanford Urban District Council.

New Members, &c.—From the applicants recommended for admission at the last meeting four members and three associate-members were elected, and one student was transferred to associate-membership.

Public Health Acts (Building By-laws) Amendment Bill.—The text of this bill was before the council, and it was decided to refer the matter to the General Purposes Committee for consideration and report.

Departmental Committee on Building By-laws.—This committee is prepared to receive evidence from the institution. The committee has been appointed to enquire into the working of the building by-laws, and it has been decided as a preliminary that the institution submit to the committee a memorandum embodying shortly its views. Members are requested therefore to let me have, within 21 days, any suggestions they may have to make as to present codes of by-laws, their working and administration, and so forth, and these suggestions will then be dealt with by a special committee of the institution that has been appointed to prepare the memorandum.

Nominations.—The following members were nominated by the council for the offices named: President: Mr. W. H. Matthews Jones, city engineer and surveyor, Chester; vice-presidents: Messrs. Henry C. Adams, A. R. Bleazard, Arthur Bowes, H. J. Farmer, and William Finch (re-nominated), and Messrs. John Robinson, surveyor to the Darlington Rural District Council, and Edward Whitwell, engineer and surveyor to the Abersychan Urban District Council. Hon. Treasurer: Mr. Thomas Mundy (re-nominated).

Next Council Meeting.—The next meeting of the

[illegible] will be held at London, on September, on day [illegible]

SOUTHERN & SOUTH-EASTERN DISTRICTS.

A visit will be paid to the districts [illegible] Sewage Disposal Co., Limited, [illegible] Thursday, August 13th, at 2.15 p.m., by kind permission of the Company. [illegible] Meet at corner of Grosvenor-road and Prince's-road.

EASTERN AND NORTH-EASTERN DISTRICT.

A visit will be paid to Hunstanton on August 11th, 12th and 13th.

Those who intend to attend the meetings and before and [illegible] of members (including ladies' parties) are specially invited. It will form purely a trip of pleasure, with the opportunity for meeting together in a purely friendly feeling.

G. BERSON CHIVERS,
Hon. District Secretary

Cardiff, Northport.

Meetings will be held at Sunderland on Saturday, October 10th, Newcastle on Saturday, November 7th, and Newcastle on Saturday, December 12th.

A Northern District meeting, in combination with Yorkshire, will be held at Harrogate on Saturday, September 12th.

B. WYAND,
Secretary

70 Victoria-street, S.W.

Waterproofing of Cement. The flat roofs over the [illegible] to the offices of the South Manchester Guardians, Withington, have been waterproofed [illegible] with Pudlo.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

INSPECTOR OF NUISANCES.—August 1st. Sedgefield Rural District Council. £110 per annum.—Mr. J. W. Lodge, clerk, Sedgefield, Ferryhill.

CHIEF ASSISTANT.—August 1st.—Corporation of Bridgwater. £180 per annum.—Mr. Jas. H. Redwell, town clerk.

SURVEYING ASSISTANT.—August 1st.—Corporation of Swansea. £120 a year.—Mr. H. Laing Coath, town clerk, Guildhall.

SURVEYOR.—August 3rd.—Faringdon Rural District Council. £120 per annum.—Mr. A. G. Haines, clerk.

CITY SURVEYOR.—August 4th.—Municipal Council of Sydney, New South Wales. £1,000—£1,300 per annum.—Mr. Thomas H. Nesbitt, town clerk, Town Hall, Sydney.

BUILDING INSPECTOR.—August 5th.—Corporation of Hove. £3 per week.—Mr. H. H. Scott, borough surveyor.

ASSISTANT TO COUNTY SURVEYOR.—August 5th.—Essex County Council. £200—£250.—Mr. Percy J. Sheldon, county surveyor, Chelmsford.

ARCHITECTURAL ASSISTANT.—August 5th.—Corporation of Hove. £3 3s. per week.—Mr. H. H. Scott, borough surveyor.

WORKING FOREMAN AND STOREKEEPER.—August 7th.—Corporation of Daventry.—Mr. F. Willoughby, town clerk.

DISTRICT SURVEYOR. — August 8th. — Pewsey Rural District Council. £90 per annum.—Mr. Robert Dixon, clerk.

SURVEYOR AND COLLECTOR.—August 14th.—Wapentakes and Manley Commissioners of Sewers. £150 per annum and commission.—Mr. Frank C. Hett, clerk of sewers, 11 Bigby-street, Brigg, Lincs.

COUNTY SURVEYOR.—August 19th.—Longford County Council. £250.—The Secretary, County Council Office, Longford.

CHIEF ENGINEERING ASSISTANT. — August 20th.—Corporation of Bedford. £150—£200 per annum.—Mr. N. Greenshields, borough engineer and surveyor, Town Hall, Bedford.

ASSISTANT ENGINEER.—Gold Coast Government Railway. £460 per annum.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

ENGINEERING DRAUGHTSMAN.—Public Works Department, Government of Nigeria. £360—£500.—Crown Agents for the Colonies, 4 Whitehall-gardens, London, S.W.

COST ACCOUNTANT.—Sheffield Corporation water department. General manager, Water Department, Town Hall, Sheffield.

TEMPORARY CLERK.—Carshalton Urban District Council.—Mr. W. W. Gale, surveyor.

HIGHWAYS FOREMAN.—Hastemere Urban District Council.—Mr. A. G. Whitcher, clerk.

BURGH SURVEYOR AND SANITARY INSPECTOR.—Inverurie Town Council. £90 per annum.—Mr. D. Nicholson, town clerk.

MUNICIPAL COMPETITIONS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

LONDON.—September 7th.—Designs for two new schools, for the London County Council.—The Clerk, Spring-gardens, London, S.W.

GLASGOW.—September 18th.—Plans for buildings proposed to be erected at the north-west corner of Trongate and High-street. Premiums, £50, £30, and £25.—Mr. J. Lindsay, town clerk.

ST. HELENS.—October 31st.—Drawings of police buildings and fire station, for the St. Helens Corporation. Premiums, £100, £50, and £25.—Mr. A. W. Bradley, borough engineer.

GILDERSOME.—Plans for twenty houses at prices from £200 to £270, for the urban district council.—Mr. W. Willey, surveyor, Council Offices.

TOTTENHAM.—Designs for the erection of a school for 900 scholars, for the Tottenham Education Committee.—Mr. W. Mallinson, clerk, Education Offices, Phillip-lane, South Tottenham, N.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. Buildings.

BROMLEY.—August 1st.—For the erection of eight cottages, for the rural district council.—Messrs. Potter & Harvey, architects, 49 London-road, Sevenoaks.

RAMSEY.—August 1st.—For the erection of twelve cottages, for the urban district council.—Mr. P. S. Bennett, surveyor.

WANTAGE.—August 3rd.—For the construction of six workmen's dwellings in three pairs, together with the construction of a sewer, house and surface-water drains, sinking a well, and erection of fencing, for the rural district council.—Mr. John W. Harris, engineer and surveyor.

STOCKPORT.—August 4th.—For the erection of shelters, bowling houses, and tennis pavilions, for the corporation.—Mr. J. Atkinson, borough surveyor.

WEYMOUTH.—August 4th.—For the erection of twenty-three cottages, for the corporation.—Mr. S. H. Jackson, architect, Bridge Chambers, St. Thomas-street, Weymouth.

HUDDERSFIELD.—August 4th.—For the erection of a public convenience, for the corporation.—Town Clerk.

HONLEY.—August 4th.—For widening a bridge, for the urban district council.—Messrs. J. Berry & Sons, 3 Market-place, Huddersfield.

STANLEY.—August 4th.—For the construction of an underground convenience and a storehouse, for the urban district council.—The Surveyor, Front-street.

MIDDLETON.—August 5th.—For the erection of a shelter, for the corporation.—Mr. W. Welburn, borough surveyor.

GLAMORGAN.—August 4th.—For alterations and additions to schools, for the county council. The Architect, Metropolitan Bank Buildings, Neath.

BAILEY.—August 5th.—For extensions to the electricity station, for the corporation.—Borough Engineer.

AYLESBURY.—August 5th.—For building a generating station, for the urban district council.—Messrs. Kincaid, Waller, Manvell & Dawson, St. Stephen's House, Victoria Embankment, Westminster, S.W.

EAST GRINSTEAD.—August 5th.—For widening a culvert, for the rural district council.—Mr. C. Turton, surveyor.

BLYTH.—August 6th.—For the erection of a public convenience, stores, and workshops, for the urban district council.—Mr. R. Grieves, surveyor.

HINDLEY.—August 8th.—For the construction of a wall, fencing and gates, for the urban district council.—Mr. O. P. Abbott, surveyor.

BENTLEY.—August 10th.—For the erection of 100 houses, for the urban district council.—Mr. R. G. Whitley, surveyor.

GLASGOW.—August 10th.—For masons' and concrete work for the proposed approach to art galleries, for the corporation.—Office of Public Works, 61 Cochrane-street.

KEIGHLEY.—August 11th.—For the erection of a cemetery chapel, for the rural district council.—Mr. T. Burton, surveyor.

LITTLEHAMPTON.—August 12th.—For the erection of a public lavatory, for the rural district council.—Mr. H. Howard, surveyor, Town Offices.

EVESHAM.—August 17th.—For the erection of thirty workmen's houses, for the rural district councils of Evesham and Pebworth.—Mr. E. H. Wadams, clerk, Union Offices, Evesham.

BRISTOL.—August 18th.—For the erection of public baths, for the corporation.—Mr. L. S. McKenzie, city engineer and surveyor.

HERTS.—August 20th.—For the erection and completion of a new special-subjects centre at Stevenage, for the county council.—Mr. Urban A. Smith, county surveyor, Hatfield.

ABERTILLERY.—August 26th.—For alterations and extensions to a school, for the Education Committee.—Mr. W. H. Haley, architect, Chapel-street, Abertillery.

Iron and Steel.

NOTTINGHAM.—August 4th.—For the supply of cast-iron pipes, specials, castings, and retort fittings, for the corporation.—Gasworks Manager, George-street, Nottingham.

FRINTON.—August 11th.—For the supply of 4,000 ft. of steel pipes for sea outfall sewer, for the urban district council.—Mr. E. M. Bate, surveyor.

KEIGHLEY.—September 5th.—For the supply of cylinders for reservoir works, for the corporation.—Mr. M. R. Barrett, engineer, Town Hall.

Roads.

HASTINGS.—August 3rd.—For the supply of 2,000 tons of broken granite, for the corporation.—Mr. P. H. Palmer, borough engineer.

BARKISLAND.—August 3rd.—For laying tar macadam and setting, for the urban district council.—Mr. T. Hutton, surveyor.

LISTOWEL.—August 3rd.—For the supply of a mud cart and stone-breaker, for the urban district council.—Mr. D. J. McMahon, surveyor.

CHINGFORD.—August 4th.—For making up parts of certain streets, for the urban district council.—Mr. T. J. Griffin, surveyor.

HOVE.—August 5th.—For providing and laying wood paving, for the corporation.—Borough Surveyor.

HUYTON-WITH-ROBY.—August 5th.—For paving with granite setts a part of Liverpool-road, for the urban district council.—The Surveyor.

BARNSLEY.—August 5th.—For making up two streets, for the corporation.—Mr. J. Henry Taylor, borough surveyor.

BIRKENHEAD.—August 5th.—For making up certain passages, for the corporation.—Mr. C. Brownridge, borough engineer and surveyor.

ARNOLD.—August 6th.—For making up a road, for the urban district council.—Mr. R. E. Clarke, surveyor.

GLASGOW.—August 6th.—For making up certain streets, for the corporation.—Office of Public Works, 61 Cochrane-street.

WANSTEAD.—August 6th.—For widening, channelling, kerbing, and resurfacing with asphalt-macadam, for the urban district council.—The Surveyor.

STOCKPORT.—August 6th.—For making up a lane, for the corporation.—Mr. John Atkinson, borough surveyor.

MANCHESTER.—August 7th.—For paving with granited rock asphalt, for the corporation.—Surveyor to the Withington Committee, Town Hall, West Didsbury.

BUXTON.—August 7th.—For various street works, for the urban district council.—Mr. F. Langley, engineer and surveyor.

HALIFAX.—August 8th.—For constructing about 1,310 super. yds. of Durax, Kleinpflaster, or similar granite paving, for the corporation.—Mr. J. Lord, borough engineer.

DALBEATTIE.—August 8th.—For paving work with granite setts, for the corporation.—Burgh surveyor.

ALFRETON.—August 10th.—Offers for a steam roller built by Messrs. Aveling & Porter in 1895.—Mr. R. F. Ward, surveyor.

BENTLEY.—August 10th.—For making up new streets, for the urban district council.—Mr. G. Whitley, surveyor.

ROTHWELL.—August 10th.—For the supply of 5,912 super. yds. of best quality granite setts, for the urban district council.—Mr. J. Southwart, surveyor.

LONDON.—August 11th.—For paving with creosoted wood-blocks, for the county council.—Mr. G. W. Humphreys, County Hall, Spring-gardens, S.W.

GOSFORTH.—August 11th.—For forming approach roadway and erecting wood and iron netting, for the urban district council.—Mr. G. Nelson, engineer and surveyor.

HASTINGS.—August 12th.—For laying 2,600 sq. yds. of limestone tar-paving, for the corporation.—Mr. P. H. Palmer, borough engineer.

ROCHDALE.—August 12th.—For making up certain streets, for the corporation.—Borough Surveyor.

BUNGAY.—August 14th.—For the supply of 345 tons of 1½-in. and 5 tons of 1-in. best broken granite, for the urban district council.—Mr. P. J. Sprake, clerk.

EPSOM.—August 24th.—For the supply of road materials, for the rural district council.—Mr. T. E. Ware, surveyor, Waterloo-road, Epsom.

ALEXANDRIA.—September 1st.—For the supply of 6,500 square metres of granite or porphyry paving stones, and 350 square metres of headers, for the Ports and Lighthouses Administration of Alexandria.—Commercial Intelligence Branch of the Board of Trade, 73 Basinghall-street, E.C.

Sanitary.

PORTSLADE.—August 4th.—For the construction of main surface-water sewer and outfall works, for the urban district council.—Messrs. Chatterton & Alford, 9 Victoria-street, Westminster, S.W.

DURHAM.—August 5th.—For the construction of 185 lin. yds. of 15-in., 12-in., and 9-in. pipe sewers, manholes, ventilation columns, and street gullies, for the rural district council.—Mr. Geo. Gregson, surveyor.

HUDDERSFIELD.—August 5th.—For laying sewers in certain roads, for the corporation.—Mr. K. F. Campbell, borough engineer and surveyor, 1 Peel-street.

HAILSHAM.—August 5th.—For the construction of sewers and sewage disposal works, for the rural district council.—Mr. E. Catt, clerk, 17 London-road, Hailsham.

QUEENSTOWN.—August 7th.—For the construction of an outfall sewer, for the urban district council.—Mr. P. H. McCarthy, engineer, 39 Westmorland-street, Dublin.

RUNCORN.—August 7th.—For laying steel tube, cast-iron and earthenware pipe sewers, flushing tanks, storm overflows, manholes, ventilators, sedimentation tanks, percolating filter (including reinforced concrete construction on the Kahn system), engine and pumphouse, pump well, and other appurtenant works, for the rural district council.—Messrs. J. Diggle & Son, 14 Victoria-street, Westminster, S.W., and Hind Hill-street, Heywood, Lancashire.

And Municipal and County Engineer.

Vol. XLVI. AUGUST 7, 1914. No. 1,177.

Minutes of Proceedings.

The Edges of Road Crusts.

One of the most important of the advances made during recent years in the science of road making consists in the recognition of the fact that the edges of road crusts need to be properly designed. It has to a great extent been the practice to make road crusts which peter out at the edges, this being a survival from a method of road making which consisted in the gravelling or metalling of a humped road bed, raised above the level of the ground, and intended for traffic along the middle only. As a result of the lack of attention to the conditions at the edges of the crust, many of our country roads have been, and still are, badly rutted near the edges, or ground up by progressive cutting back from the edges towards the middle. In other cases the quantity of road metal applied near the edges has been considerable, or even very large, and some of it has been squeezed into the raised turf margins, or into the banks of narrow lanes, giving, in a rough fashion, some measure of lateral support, and even some extra thickness of crust near the edges. But variations in the amount of metal applied per yard have caused initial undulation, or varying degrees of support leading to undulation, and the wavy character of many road margins, accentuated by surface drainage, is a marked feature on many roads. Well-designed roads, such as those made some decades ago in certain German States, and the still earlier roads of Trésaguet, were often provided with border stones, the surfaces of which were sometimes flush with a raised margin, but more often flush with the surface of the roadway. Such supports have an excellent effect during the construction of the road crust, and the border stone which is flush with the surface of the road plays a useful part in spreading wheel loads lengthwise with the road, and so reducing the shearing effect at the edges. Such border stones are now sometimes called "abutments," but it is important to observe that they are not comparable in their functions with the abutments of bridges. This was fully explained, with numerical calculations, in an article which appeared in THE SURVEYOR some little time ago—a criticism of certain observations made by an American engineer. Considering a road crust as an arch, we find that its thrust is very great indeed, much too great to be taken up by border stones acting as abutments, and requiring a very strong beam resting against solid soil, or massive masonry abutments.

What is really needed at the edges of the crust is to give as much vertical support as is provided in the middle of the road, and to spread each wheel load no less. The subject was ably presented at the second Irish Road Congress by Mr. Reginald Ryves, who specially advocated methods involving the carrying of the crust beyond the normal incidence of wheel loads,* taking it right under a raised margin or into a bank, or so incorporating it with a virtual crust beyond the visual edge of the carriageway that the strip of crust beyond the incidence of wheel loads would be wide enough to allow of the full spread of the load upon the subsoil. This method not only spreads wheel loads, but it also prevents the chipping away of the edges of the crust. Increased depth alone, as provided by Mr. Arthur Gladwell's trenching method, has certain advantages, and though it does not wholly prevent chipping of the edges, it spreads the load fore and aft, and so reduces the pressure upon the subsoil. To obtain an even more definite and certain spread of the load fore and aft, Mr. A. Dryland, M.INST.C.E., county surveyor of Surrey, is adopting a continuous concrete border stone, which he lightly reinforces, this method being described in an interesting note which he contributed to our issue of last week, p. 166. The drawbacks to this design seem to be: First, that there is not adequate protection of the outer edge of the concrete; and, secondly, that the vertical surface between the concrete and the crust proper substitutes friction merely for the normal cone effect, and so destroys vertical support. The method is very effective in reducing the load upon the subsoil when a wheel is at the edge and rests on the border stone (or, in this case, concrete beam), but the reduction of the pressure on the subsoil is much less when the wheel is close to the beam, but does not rest on it. There is then no increased spread of the load fore and aft, and, owing to the interposition of the beam, the spread outward is suddenly reduced. This difficulty might be overcome by an alteration in the design, but even then the sudden change to a material with a different modulus of elasticity, different hardness, and very different degree of resistance with respect to load distribution is a drawback inherent in the method. In cases in which marginal traffic is small in amount, though severe in character, it may, however, prove to be very useful. To provide against the actual crushing down of the edge of the crust is sometimes an important matter, and Mr. Dryland is to be congratulated upon his practical application of the principle of fore and aft distribution of wheel loads, combined with the prevention of lateral creep of the crust. Mr. Dryland thinks that some surveyors might prefer to use a thicker and deeper beam, but, although we think this likely, we are inclined also to consider the advantages of somewhat stronger reinforcement, so that the efficiency of the edging as a vertical and lateral beam may be amply secured.

* See THE SURVEYOR, Sept. 8, 1911.

Road Foundations on Clay Soils.

It would be hardly too much to say that the area that still clay can be drained by pipes is one of the most characteristic of those features which render road making and maintenance so much more costly than need be. The spacing of drains under a road crust must usually be much closer than is supposed to be necessary, if the drains are to be really effective; and in the case of a clay soil, in which the hydraulic gradient approaches 90 degrees, the space between the drains is reduced to nothing. This means that we need a continuous drainage layer, which may also be a part of the strength crust, and is usually either a Telford pavement or hand-packed rubble of stones differing much in size, but not continuously graded. Our readers will be interested to learn from a perusal of the article contributed to the present issue by Mr. G. H. Jack, county surveyor of Hereford—that this method of bottoming roads on clay soils has been adopted in that county, which, as we have more than once observed, is specially deserving of Road Board contributions on account of the troublesome nature of its clayey and silty subsoils. Attempts to provide drainage by means of pipes laid in rubble proved a failure, for the reason we have indicated above; but it may safely be predicted that the method which Mr. Jack has now adopted will prove successful, and his description thereof may be commended to the notice of surveyors who are faced with similar difficulties.

New York Water Purification Project Killed.

After hearing so much of the great works for the water supply of New York, constructed at enormous expenditure, and providing for a prospective population estimated upon the most liberal basis, it comes as somewhat of a surprise to find the American Waterworks Association considering the very unsatisfactory quality of the water supplied, and lamenting the fact that a project for the purification of the water which has been ten years under consideration has been finally abandoned. Mr. George W. Fuller, in a recent paper dealing with this question, draws attention to the impure quality of the Croton supply. It appears that the water is polluted, that its colour is high, and that a bad odour is at all times perceptible, and sometimes very marked. There are troubles from microscopic growths. The best that could be said for it by the commission employed to investigate the matter in 1913 was that the water is reasonably safe, "except possibly for short intervals, as indicated by the typhoid outbreak of 1907." A water which is believed to be subject to pollution of this kind for short intervals is obviously unfit for human consumption, and it is not to be wondered at that various property owners are required to treat the water supplied to them by the City of New York, that the hotels and apartment houses and many private residences and office buildings have to filter their water, while the large trade in bottled water for drinking purposes results in an outlay of money which would more than pay for the operation, cost and maintenance of purification plant to serve the whole city.

It may be urged that this condemnation applies only to the Croton supply, whereas the New Catskill aqueduct will provide water of better quality; but apparently this is not so. Mr. Fuller points out that some study was given to the possible effect of the use of the Catskill supply in times of high turbidity as a substitute for the Croton, and that the indications are that the Catskill supply will at such times be no better than the Croton water. We are further told that reliance is placed upon treatment with hypochlorite, which is without doubt unsuitable to water containing much organic matter. If sufficient hypochlorite is added to destroy the organic matter and to leave an excess sufficient to destroy the micro-organisms there must be an unpleasant taste and odour. If not the treatment is insufficient to deal with the micro-organisms. In spite of all that has been said and written upon this subject to the effect that such treatment is only suitable for clear water, or for filtered water, we still hear continually of the foolish practice of trying to sterilise water with a high organic content with hypochlorite. It is, however, a matter of surprise to find the city of New York deciding to continue the use of this system in the face of the advice of all the engineers and water experts who have reported again and again in favour of better treatment. Mr. Fuller emphasises that it is "even more curious that the same officials who had voted to give New York a proper drinking water should later, with the same information before them, reverse themselves; that a board of aldermen, who but a short time before were considering a vote of censure on the executive department for their slowness in providing filtered water, should a few months later repeal their ordinance and condemn the project; that the newspapers, which had just stopped printing attacks on the city officers for their negligence in providing bad water, should write to oppose the so-called steal when they were about to receive their demands."

Mr. Fuller's paper forms interesting reading not only as regards the details of a very interesting scheme for water purification, but as showing how a great project, apparently of a most urgent character, may be killed by opposition in the face of all expert advice. It suggests that we here see on a large scale how a purely engineering matter is often settled by laymen in the face of all qualified advice. In a more enlightened age it is to be imagined that it will be as impossible for the lay official, alderman or councillor to deal with engineering matters against the advice of the engineer as it would now be for them to deal with legal matters against the advice of the lawyer, or with medical matters against the advice of the doctor.

* * *

War and the Engineer.

When we read of an attempt made by an innkeeper and his son to destroy a tunnel, and of another person endeavouring to poison wells, as early incidents in the war between France and Germany, the idea that we should do well to guard ourselves against the possibility of injury to our municipal works at once suggests itself. It is needless to take an alarmist view; on the other hand it is wise, as a correspondent makes clear in a letter which we print elsewhere in this issue, to be fully prepared for the fortunes of war. The municipal engineer has at all times a great responsibility, but in time of war this responsibility is surely increased. To consider one of the many works for which he is responsible—the water supply. The greater the work, the greater is its vulnerability; one man with a spade could easily start a burst in an earthen dam, and one small cartridge might wreck the conduit which supplies a city. How soon might the most perfect pumping machinery be put out of gear or utterly ruined. Again, one may imagine how easily a great sewer might be blocked or even wrecked, and how seriously this might, under certain conditions, affect the district served. The same applies to power and electricity stations, to bridges and to docks. In the case of dock basins the malicious bursting of a wall might easily lead to the wrecking of a large number of vessels, while injury to dock gates and caissons would be followed by the most serious consequences. It is idle to enumerate or to suggest the various ways in which

harm might be done; every engineer knows only too well how easily the greatest works could be injured or wrecked, seeing that they have been designed and constructed for the purposes of peace, and not to withstand malicious attack.

Bearing these facts in mind it is clearly the duty of the municipal engineer at the present time to take every possible precaution against the possibilities mentioned. Reservoirs certainly ought to be watched and guarded where the supply of large communities is dependent upon them; similarly long exposed pipe lines ought to be watched. At present it would not be difficult for our country's enemies to damage aqueducts or reservoirs. It is a case in which the municipal engineer should carefully consider what works under his control are sufficiently important and vulnerable to require special guarding, and next he would do well to see that they are efficiently watched. If his own staff of workmen are insufficient, as may well be the case, it is his duty to call attention to the fact, and the help of the police, military, and territorials may well be required. There will be a very large number of persons ready and willing to serve their country at the present time. These might be employed in guarding municipal works, but such service will be useless unless it is first directed by the municipal engineer. There are other dangers incident to a state of war. The bridges and highways may need special protection. Excessive loads may come upon them, and it is the duty of the municipal engineer to see that these are strong enough to sustain the loads, and where necessary to make provision for temporarily strengthening them. We do not wish to adopt any alarmist attitude; happily the risk of actual invasion is extremely remote. There are, nevertheless, other chances of trouble which should not be overlooked, and the proper guarding of municipal works at the present time is a duty which should be brought prominently forward, seeing how vitally the well-being of every citizen is affected.

* * *

Fishing in Public Reservoirs.

Whether it is desirable that the public should have access to our reservoirs, or whether the reverse is the case, it is well to take into account the fact that a large number of water authorities provide angling for their ratepayers by making use of the waters from which the town supplies are drawn. Mr. Ernest Phillips, in his book upon "Trout in Lakes and Reservoirs," a review of which appears on page 211, states that there are over sixty municipal or urban authorities who are following this course. Further, he gives a list of over 150 reservoirs used for fishing purposes, and it is to be noted that day tickets and season tickets are issued in many cases. Mr. Phillips quotes, as an illustration, the case of Sheffield, which possesses an angling association with a roll of 20,000 paying members. Here the corporation have acquired the fishing in one of the reservoirs. It is not to be inferred that this particular reservoir is polluted; but when one considers the very large number of anglers—if Sheffield is to be taken as typical—and the growing practice of permitting persons to fish in reservoirs used for the storage of drinking water, it is clear that the practice is one which ought to receive very careful attention as regards the possibilities of water pollution.

Where fishing is allowed in any reservoir there must necessarily exist some chance of contamination. In the first place the baits freely used at certain reservoirs are worms and gentles. There are also possibilities of ground bait of an unpleasant character being thrown into the water in fairly large quantities. But a far greater danger naturally exists from the possibility of the excretions from persons fishing during a long day entering the water. It is, for instance, quite possible that a typhoid carrier might thus pollute the water near the outlet of a reservoir. Purification by storage plus the enormous dilution which is likely to take place may, and probably do, render the water safe. It would, however, be interesting to hear what the bacteriologist has to say on the point. Dr. Houston, for instance, tells us that "if a typhoid carrier micturated in the river above the intakes (say from a boat), the typhoid germs, in the absence of storage, would be carried directly on to the filters, with consequences which could hardly be other than calamitous." Dr. Houston would safeguard the river water by large storage in reservoirs because it is subject to such pollution, which he considers more serious than any other, for he says. "Even if water is polluted with as much as from 0·001 to 0·0001 per cent of crude sewage, the chances of typhoid bacilli being uniformly present are extremely remote . . . but a water polluted with extremely small traces of typhoid urine would probably suffice to produce a serious epidemic." How, then, stands the case with those reservoirs from which the corporation or water authority derive an income due to the sale of tickets to anglers, or where fishing from boats is permitted? Is it possible to prevent such contamination as that against which Dr. Houston has warned us? It is impossible to read of the large number of reservoirs, including those of our greatest towns where fishing is encouraged, without fearing that a grave risk is being taken, a risk which is likely to become greater as the number of anglers increases. Stringent precautions ought to be taken in any case, and in no case should fishing be permitted against the advice of the bacteriologist, whose opinion ought to be obtained as a preliminary measure.

* * *

National Health Week.

The institution of a National Health Week some two years ago at the instance of the Agenda Club received our cordial support at the time, owing to our belief in the value of educational propaganda as an aid to the practical work of public health administration. Health departments and voluntary agencies have come to realise that the principal foes against which they have to fight are the twin demons of apathy and ignorance. In this connection the value of Health Week is twofold. In the first place it means an annual organised attempt to shed the light of knowledge in places where it has not penetrated hitherto; and, in the second place, it tends to produce a spirit of co-operation between the various voluntary societies and public bodies, which are all working with the same object in view. The second celebration of Health Week, which took place last year, showed that the movement was receiving even greater and more widespread support than was the case in the year of its inauguration, and there can be no doubt that the present year will witness further developments. The fact that the arrangements are in the hands of the Royal Sanitary Institute is in itself a great thing, and, coupled with the consent of the Lord Mayor of London to act as chairman of the General Committee, should go far to insure success. Further, it is announced that a letter has been received from the President of the Local Government Board stating that the board would be prepared to consider applications from sanitary authorities whose accounts are subject to audit by the district auditors for sanction to reasonable expenditure in connection with the holding of a Health Week in their districts this year. This official recognition of the advantages to be gained should secure the inauguration of a celebration of Health Week in many districts which have hitherto held aloof.

Sub-Crust Movement in Roads Subject to Heavy Mechanical Traffic.

By G. H. JACK, County Surveyor, Herefordshire

I was interested, unable to be present at the Cheltenham meeting of Municipal Engineers, I have dealt with [illegible] the paper submitted by [illegible] the county surveyor of [illegible].

In this county with [illegible] of our roads of steady main road [illegible] the Cotswold Hill road [illegible] on the old soil surface about [illegible] during the winter months [illegible] and [illegible] quite satisfactory, and that all tendency to spread ceases.

Until recent years there were some stretches of road which could not be satisfactorily maintained without recourse to entire reconstruction.

During the winter the centre was pressed down to heavy [illegible] so that the camber instead of being convex was concave, and the ditches were squeezed out of existence, the obstruction accentuated the general trouble and caused the roadsides to be thoroughly [illegible] and yielding to even light traffic. The annual loss of metalling on such road was enormous, and I have found unworn Clee Hill stone embedded in the clay 2 ft. below the surface. Fig. 1 shows such a road after the haulage by traction engine of 3,690 tons of coated stone over it during a period of seven months. Prior to the haulage the road presented a good appearance.

Fig. 1.—Hereford-Shrewsbury Road Destroyed by Excess owing to Instability of the Subsoil.

It appears to me that, provided reinforced frames were placed on such a road, the necessity for reconstruction would remain.

The mixture of clay and stone would be still unstable. The character of the subsoil under the roads with which I am dealing varies considerably; there are no two miles alike. In some cases the subsoil for the full width is of a yielding nature; in other cases the sides only are weak, and in others there are weak areas varying from 1 to 50 sq. yds.

Briefly, the method I am adopting is to remove all the soft material and replace it with large sized hand-packed stones, 6 to 18 in. in size. Fig. 2 shows such material in use on roads for the full width.

Fig. 2.—Hereford-Bredon Road: Heavy Foundation Work in Progress.

The roads are treated half width at a time to facilitate the traffic. Fig. 3 shows a road being strengthened at the sides only (Hereford and Gloucester road). At intervals stone drains are laid from the bottom of the foundation to a convenient and

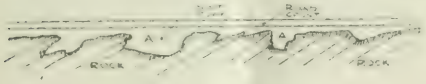
to be readily opened out of shape by heavy mechanical traffic. Mr. Sinnott has entirely overlooked the extent of the movement of the subsoil in such roads. For years attempts were made in this county to arrest the disastrous spreading of the road by digging out the softest clay beds and pitching the places with [illegible] stone, but the work was not sufficiently extensive, and the result was a [illegible] waste of valuable surfacing material. To tar-paint such roads, or to have employed costly tarred material, would have been a sheer waste of money. It was not until the Road Board came into existence that the work could be tackled in a scientific and extensive manner. Twenty-two miles of road are now in process of reconstruction. The surfacing work is straightforward and easy to accomplish. It is the foundation work which takes up the bulk of our time and money. In my opinion this wholesale strengthening of weak roads with local materials not only solves the problem of movement in sub-crusts, but also provides a perfect foundation upon which may rest the expensive surfacing materials now in vogue.

This article is intended to give some idea of the methods adopted in this county, and not so much a criticism of Mr. Sinnott's methods. I would not attempt to dilate upon the merits of the reinforced frames without the experience of their behaviour in practice. I can say, however, that roads treated in the manner indicated by the illustrations

clear outlet. Some of Mr. Sinnott's critics suggest that proper drainage would get rid of the whole trouble. This is not so. I thought so at one time, and spent a good deal of money in laying agricultural pipes in rubble trenches, but the result was rather disappointing. The reason the drains have not a complete success lies in the fact of the clay being so dense that the passage of the water to the drains is much too slow a process.

The greatest difficulty has been experienced on roads cut along hillsides and in cases where the rock lies from 1 ft. to 2 ft. below the surface.

A longitudinal section of such a road is given



The clay in the pockets at AA is very soft, and until it is entirely removed it is impossible to be sure of the good job being made. Fig. 4 shows the filling of such places with large local stone. The road over this construction is not absolutely rigid. In every case the foundation material is carried well under the verge, as shown on Fig. 3. This prevents the displacement of the edging by heavy vehicles using the sides of the roads. The cost per mile would be misleading, for the reason that no two roads bear any resemblance as regard cost. The cost per square yard, consolidated and surface-bonded, and left ready for smooth for use by motor-traffic, the tarred surface is applied, works out as follows: 2½ in. thick, 4s. 8d.; 1 in. thick, 3s. 3d.; 6 in. thick, 1s. 8d.

I do not claim anything new in the methods I have described; at the same time, the fact of being sure of the road foundations being really rigid before any tar or stone are put on is even now not a common procedure. I have often been surprised to hear of miles of tarred surface being laid down upon roads which were as weak as they could be. There can be no real economies effected in the maintenance of road surfaces until the foundations are sufficiently rigid to keep the surface in proper shape. Once this is attained surfacing with bituminous materials is simple and efficient.

Fig. 3. Hereford-Gloucester Road. Strengthening of Weak Sides.

DEATH OF MR. JOHN WAINWRIGHT.

Mr. John Charles Rawlinson Wainwright, of John Wainwright & Co., Limited, Shepton Mallet and London, died, we regret to state, on July 24th, aged fifty-five, after a severe illness of several weeks.

Mr. Wainwright was in many respects a remarkable man. Rising superior to physical infirmities caused by a severe illness in his early years, he was instrumental in establishing the cattle market at Shepton Mallet, and in developing the stone trade of the district. By the introduction of new methods, he was able to convert the Moor's Hill quarry into a paying concern, and he also became interested in colliery enterprise at Newbury. His tarred stone and asphalt works proved highly prosperous concerns, and basaltic concrete slab paving was one of his specialities. In social life he was greatly esteemed, and much sympathy is felt for his widow.

The funeral took place on July 28th at Shepton Mallet cemetery, and was attended by nearly a hundred persons, including the deceased's business [illegible] and railway and commercial representatives.

Deal's Proposed Marine Pavilion.—Sanction was refused on the 29th ult. by a committee of the House of Lords, presided over by Lord Haversham, to a Bill which had been passed by the House of Commons) to authorise the corporation of Deal to construct on the sea-front, about midway between the pier and the castle, a pavilion in which musical and other entertainments could be given.

Proposed Town Planning Scheme for Wallsend. Mr. S. D. Pepler, Local Government Board inspector, officiated at an inquiry on Tuesday week into an application by the Wallsend Corporation for sanction to prepare a town planning scheme in an area consisting of 1,110 acres on the north of the town. The borough surveyor, Mr. George Hollings, stated that under the proposed scheme the council would be better able to arrange for through roads, and would be able to control the number of dwellings to the acre. On that point they hoped to confer with the landowners.

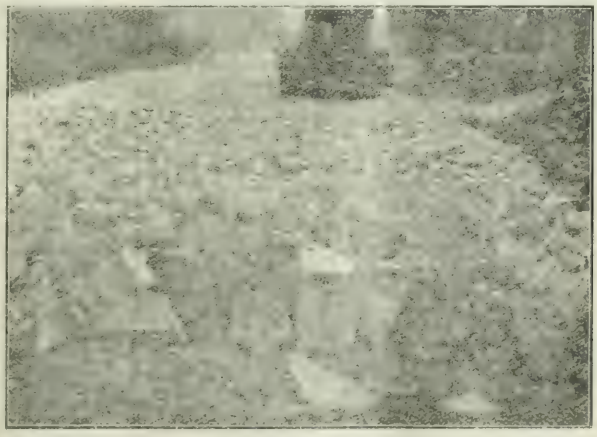


Fig. 4. Hereford-Shrewsbury Road. Special Work in Places where Clay has been Removed from "Pockets" (A.A. on Sketch).

CLASSIFICATION OF ROADS.

COUNTY COUNCILS ASSOCIATION COMMITTEE'S REPORT.

At the last meeting of the Executive Council of the County Councils Association the Highways Committee reported that a memorandum on the question of the classification of roads had been considered and the following resolution passed:

(*a*) That the expression "main road" should be abolished, and the existing law relating to highways should be amended in accordance with the suggestions contained in the following paragraphs:—

FIRST-CLASS ROADS.

(*b*) That a borough or urban district having a population of not less than 10,000 should have power to claim to retain any first-class roads within their areas, and in such case such roads should for all highway purposes be vested in the borough or urban district

Fig. 5.—Hereford-Shrewsbury Road: Foundation Material Carried to Side Ditches; New Edging in Process of Formation.

council, and should be called first-class borough roads or first-class district roads, as the case may be. Provided that any borough or district council which has claimed to retain a road should have power subsequently to surrender such road to the county council whenever they may think fit.

(*c*) That all other first-class roads should be known as first-class county roads, and should for all highway purposes be vested in the county council.

(*d*) That half of the approved annual expenditure (including any annual charge in respect of loans) on maintenance of all first-class roads should be paid by the Exchequer and half by the county council; but the county council should not be liable to pay half the cost in the case of a borough or district road unless the county surveyor has certified that it has been efficiently maintained.

(*e*) That the county council should have power to contribute to the expenditure of any first-class borough or district road in addition to the half cost of maintenance.

SECOND-CLASS ROADS.

(*f*) That, except as is hereinafter provided, all second-class roads should, for all highway purposes, be vested in the borough or urban or rural district council, and should be called second-class borough or district roads.

(*g*) That a county council should have power to claim to retain any second-class roads which were main roads before the passing of the Act, and that a borough or district council should have power by agreement to surrender to the county council any second-class road within their area. Any such roads should be vested in the county council, and should for all highway purposes be known as second-class or county roads.

(*h*) That the cost of maintenance of second-class roads should be paid in the case of borough or district roads (not vested in the county council) as to ¼ by the Exchequer, ¼ by the county council, and ½ by the borough or district council, subject to provisions as regards efficient maintenance, as in the case of first-class roads, and in the case of county roads (vested in the county council), as to ¼ by the Exchequer and ¾ by the county council.

(*i*) That the county council should have power to contribute to the expenditure which they may approve on any second-class road, in addition to their legal liability.

THIRD-CLASS ROADS.

(*j*) That the borough or district councils should be solely responsible for the third-class roads within their area, and such roads should for all highway purposes be vested in them, provided that they should have power by agreement to contract with the county council for their maintenance. Provided also that a county council should have power to claim to retain any third-class roads which were main roads before the passing of the Act, and that a borough or district council should have power by agreement to surrender to the county council any third-class road within their area, and that in any such case the county council should be responsible for the entire cost of such roads, and the roads should for all highway purposes be vested in the county council.

BRIDGES.

(*k*) That any bridge vested in a highway authority, together with the roadway and approaches thereto, should, for the purpose of Government grants, be treated as part of the highway of which it is a continuation.

PAYMENT OF GRANTS.

(*l*) That all Exchequer grants in respect of first-class roads should be paid to the county council, and in respect of other roads to the authority in which the road is vested, and payments should be made on account during the twelve months, but leaving a sufficient margin to enable the Road Board to ensure generally efficient maintenance.

PIPES IN MAIN ROADS.

NEW DECISION BY A SELECT COMMITTEE.

A novel point arose last week before a Select Committee of the House of Commons, presided over by Mr. Lane Fox, which had under consideration a Bill to provide Weston-super-Mare with an improved water supply.

The Somersetshire County Council wanted the insertion of a clause providing that when it was necessary to alter the level or improve main roads any additional cost arising because of the necessity for moving the pipes of the Weston-super-Mare District Council should be borne by the district council and not by the Somerset County Council. It was pointed out that the county council had a public duty to perform in respect of the roads, and it was only fair, in the event of the urban district council's pipes causing any additional expense, that it should fall on the district council, and not be borne by the county council.

The district council, while admitting this fair in the case of bridges belonging to the county council, objected to it in regard to main roads, which had to be improved to meet the weightier traffic. It was contended that it was an attempt to put part of the burden which should be borne by the county council upon the district council.

The committee unanimously decided to insert a provision as asked by the county council.

This is the first time such a decision has been given in respect of water mains.

Carbis Bay (Cornwall) Water Supply.—A water company is about to be formed for the purpose of supplying Carbis Bay and Lelant, including the celebrated golf links, with a permanent water supply. Mr. A. P. I. Cotterell, M.Inst.C.E., of Westminster, is the engineer.

The Croton Water Supply.

THE QUALITY AND PURIFICATION.

That the ten-year-long attempt to give the citizens of New York a drinking water supply of a quality such as is elsewhere demanded should have proved abortive, the causes, the possibilities and much interesting comment are the subjects of a paper written by Mr. George W. Fuller, and published in the "Journal" of the American Waterworks Association.

The author describes his paper as one upon a dead project, but he considers this a matter of such significance as to merit a full description.

QUALITY OF WATER SUPPLIED TO NEW YORK.

The water supplied from the Croton reservoir is gathered from a watershed containing much swampy land. The colour is frequently high, odour is perceptible and sometimes very marked. Microscopic growths give the water a distinct taste, sometimes very disagreeable. The watershed is inhabited by 25,000 persons, whose sewage eventually reaches the reservoirs; a very small part of the population is provided with sewage disposal works. The sewage from passenger trains passing along 13 miles of railroad track within 300 ft. of the flow line, and along eighteen railroad bridges, aggregating 1,700 feet in length, enters the reservoirs practically raw. Highway bridges, nineteen in number, aggregating 4,200 ft. in length, discharge their wash into the reservoirs. Wash from roads and run-off from farm lands, and the existence of some 24 square miles of swamp land on the watershed cause at times a heavy turbidity, and "at all times a marked colour, bad odour and taste." The official records show that in times of flood the storage in the Croton Lake is only sufficient to provide for a retention of the water flowing therein for from ten days to fifteen days, and as the time required for the water to flow through the aqueduct from Croton Lake to New York may be measured in hours, the period of detention in times of flood is not sufficient to give security against the introduction of infected water to New York, provided infection exists in the watershed.

WATER OF AVERAGE QUALITY.

The author, however, prefaces his remarks with the words: "The Croton water on average is of fair quality." We are also told that "a high typhoid death-rate shows generally a dangerous water; a low rate, such as ours in New York, shows a water of safe average quality." Seeing, however, that there are "numbers of property owners who are now required to filter, or otherwise treat, the water supplied to them by the City of New York," that "the great majority of hotels and some apartment houses, as well as many private residence and office buildings, resort to local filtration of the Croton water," and that "the purchase of bottled water for drinking purposes" is "a practice which is very common," it seems that the typhoid rate may be affected beneficially in some degree thereby; that the official figures may be somewhat misleading, and that there is, after all, something seriously amiss with this water of "safe average quality."

PRESENT TREATMENT.

Copper sulphate is applied to the water in the reservoirs in order to reduce the microscopic vegetable growths, and the water on reaching the city is treated with hypochlorite, and the grosser sources of pollution in the watershed are individually treated. But, as is well known, such treatment with hypochlorite can only be successfully applied to clear or filtered water. "When applied to raw water with an appreciable organic content, larger doses must be used because enough must be applied to combine with the organic and other matters in the water which are capable of rapid oxidation in its presence, and still leave enough excess to perform its germicidal function. The amount of organic matters in many waters fluctuates rapidly from day to day, and even from hour to hour, and the difficulties of regulating the dose of hypochlorite to meet these fluctuations probably accounts for the incomplete sterilisation of raw water."

Such are the words of the majority report of the commission employed to investigate the matter in 1913. The report also states that the typhoid from statistics indicate that the Croton water is reasonably safe, "except possibly for short intervals, as indicated by the typhoid outbreak of 1907." Then short intervals of typhoid surely suggest that the water is of unsafe quality. Mr. Fuller sums up the situation in the following words: "Real safety we are not getting. Limited by the need of adding only enough hypochlorite not to spoil the taste, and with an organic content in the water varying from day to day, it is not physically possible closely to vary the hypochlorite dose so as to oxidise both the organic matter and the bacterial content and leave no objectionable excess."

SAND FILTERS AND MECHANICAL FILTERS.

In the year 1907 Messrs. Herring & Fuller carried out an investigation which resulted in a recommendation to build 42 acres of slow sand filters, and to employ coagulation during eight months of the year. Later, in 1911, a thorough investigation of the relative merits of slow sand filters, both with and without coagulant, and of mechanical filters was made. Comparative estimates of cost were also prepared. It was shown that, while either of the three types of filter would produce uniformly satisfactory results as to freedom from bacteria and obnoxious odours, plain sand filtration would not remove the turbidity and colour in the Croton water at all times, and that, following the very heavy rains, the effluent of the sand filters would show excessive turbidity. On the other hand it was possible to obtain at all times a fully satisfactory grade of filtered water by either the modified sand filter method or by mechanical filters. So far as quality was concerned, there would be no choice between these two methods, viz., slow sand filters with coagulation and mechanical filtration. When, however, costs were compared, mechanical filters showed a saving of first cost of $3,500,000, and an annual saving of $135,000.

These plans and estimates were then submitted to a consulting board of experts in 1912, who reported favourably upon the scheme, which was as follows:—

WATER PURIFICATION SCHEME.

The raw water might or might not be aërated. This point was left unsettled. Aluminium sulphate was to be used for coagulation, and lime or soda were to be used to neutralise excess carbonic acid in the filtered water. Sterilisation was to be effected by the addition of from ·5 to 1 part per 1,000,000 of hypochlorite to the filtered water.

RUST TROUBLES.

Much study was given to the question of rust trouble. "The presence of carbonic acid in quantity explains this action." It was decided as the result of experiments that the corrosion of iron pipes is directly proportional to the carbonic acid present; that alum-treated water produces practically no more rust than the Croton water, untreated, mainly because the amount of carbonic acid set free is small; that it is desirable only to neutralise the free carbonic acid either with lime or soda.

The fact that complaints of rust are more general with filtered waters than with unfiltered waters is probably to be explained by the action of the clean filtered water in removing existing protecting coats and deposits, and keeping the iron surfaces somewhat cleaner. To eliminate a possible source of complaint on the introduction of filtered water, it was decided to add lime or soda so as to reduce the carbonic acid to a point where no objectionable effect would be experienced.

DETAILS OF WORKS PROPOSED.

The chemical mixing chamber had a capacity of twenty-eight minutes' normal flow, and a velocity of 1 ft. per second. The settling basins gave a period of detention of six hours, and a velocity of ·40 in. per second. A special basin was also provided for settling the filter-wash water so that it might be refiltered at times of water shortage.

Eighty filters were provided with an effective sand surface of 359 sq. ft. per 1,000,000 gallons rating. The filter sand specified was unusually coarse, being from 0·60 to 0·70 mm. effective size. The plans pro-

through channels at 1 ft. per second velocity, after

pension tanks 42 cub. ft., in the same proportion, and hypochlorite solution tanks 34 cub. ft. per 1,000,000 gallons per day.

and disinterested engineers, was again referred to another advisory commission, the majority of whom reported favourably. Mr. Fragee, assistant engineer, stating that the advancement of sanitary and medical treatment (hypochlorite application) and the inoculation against typhoid, tend strongly to discount the conjectured possibility of future outbreaks pending abated. Finally, Mr. Mitchell, the Mayor of New York, "reported to the board of estimate his deduction that, in his judgment, hypochlorite would make the water safe, and that aëration would serve to remove from 50 to 75 per cent. not only of the tastes and odours, but also of the colour and turbidity from the water. With this he cast the vote which killed the project."

SPECIAL FIRE SERVICE AND FIRE PATROL WORK.

AN EMERGENCY FORCE.

We have received for publication the following letter, signed jointly by Lord Londesborough and Mr. Edwin O. Sachs, chairman of the British Fire Prevention Committee:—

"Fire brigade and fire patrol work will shortly be for our fortified and defended places, for our arsenals and national stores, and for certain Government establishments requiring special protection.

"We are thus preparing a roll of retired fire brigade officers and firemen—both professional, volunteer and private—who are ready to join an emergency fire service force or forces to be placed at the disposal of the Government.

"To a limited extent we are also prepared to put on this roll fire brigade officers and firemen of inland (country) brigades—both volunteer and private—not exceeding three from any one brigade.

young engineers (used to steam engines or motor cars), and young surveyors or architects (used to building, survey or dangerous structure work), who, be valuable in an emergency fire service force.

"Applications to be entered on the roll should be addressed to us at the offices of the British Fire Prevention Committee (8 Waterloo-place, London, S.W.), the organisation and staff of which will be at our disposal.

"Application should be made *in writing only*, with the following particulars: (1) Full name; (2) address; (3) age; (4) vocation; (5) fire brigade experience, with dates; (6) special qualifications, if any; (7) reference; and further (8) whether the applicant is prepared to serve (*a*) gratuitously, (*b*) under the same conditions of pay as the Territorials, or (*c*) if the ordinary professional rate of fire brigade pay is required."

Trade Note.—The Adamant Stone and Paving Company, Limited, of Palace Chambers, 9 Bridge-street, Westminster, S.W., whose works are at Aberdeen, has despatched during the past week upwards of [illegible] of their Aberdeen Adamant footway paving slabs in the following vessels: s.s. "Lossie," s.s. "Ferryhill," s.s. "Briton," s.s. "Maggie Lough," and the sailing ship "Mary Miller." This demonstrates their facilities and capabilities for loading large quantities of paving in a very short time from their wharf at Aberdeen.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Is it the railway a rather notable instance of the Government's [illegible]? At a recent meeting of the Twickenham Education Committee Mr. F. W. Pearce, [illegible] that body as well as to the urban district council, was asked what progress had been made with regard to the affixing of tablets on historic houses in the district. To this Mr. Pearce replied that he felt responsible for any delay in the matter, but would devote to it the first week of his holiday!

* * * *

Should not Mr. Herbert Samuel, the President of the Local Government Board, be congratulated on [illegible] that his predecessors in office? For has he not stated that the board would be prepared to consider applications from sanitary authorities, whose accounts are subject to audit by the district auditors, for sanction to reasonable expenditure in connection with the holding of "Health Week" in their district in November of this year? Is not this concession a step in the right direction, and may it not lead to a more favourable consideration in the future of the question of the payment of the expenses of surveyors attending conferences and meetings at which are discussed questions materially affecting the national health?

* * * *

When will the traffic in London reach such a congested condition that it will be found necessary to prohibit the cartage of heavy goods through certain streets between the hours of 8 a.m. and 11 p.m., and does not this seem to be an obvious though rather drastic solution of a part of the difficulty?

* * * *

Are not pedestrians themselves responsible in great measure for the numerous accidents that occur? Is it not a fact that not one in a thousand foot passengers make use of the subways provided at the bottom of Whitehall, and that still more dangerous crossing near Blackfriars Bridge?

* * * *

Is it possible that the London County Council can be so ill-advised as to contemplate spending a further £1,000,000 of the ratepayers' money on a scheme for linking up their tramways? Is it not evident that with the advent of the "flexible" motor omnibus the tramcar is doomed, and that the now old-fashioned ponderous "Noah's Ark" of traffic must give way to the agile fleet of rover motor 'buses? Does not this attempt by the London County Council look like throwing good money after bad?

* * * *

Is it not almost [illegible] that the London County Council are now proposing to run a double line of tramways from the terminus at the northern end of Vauxhall Bridge-road along Victoria-street to join the existing tram lines at Westminster Bridge? Is it not curious that while, on the one hand, the question of relieving the ever-growing traffic in the London streets is exercising the minds of all thinking people, the London County Council should still be engaged in placing the most serious obstructions that are known to traffic in our already congested streets? When will that body realise that the tramcar is as much out of date as the hansom cab?

* * * *

Where is Kirkham, in Lancashire, and why should it have achieved an unenviable notoriety for dirt and squalor? Those of us who are acquainted with Dr. Sargent, the medical officer of health for the county of Lancashire, will know that in his report on this unsavory place he has probably not exaggerated his indictment in the least degree. What is Kirkham going to do?

* * * *

Is not the proposed imposition of a tax on motor omnibuses using our roads a reversion to the old policy of about 100 years ago, when Acts of Parliament were framed to endeavour to adapt traffic to roads instead of the roads to the traffic? Is this policy any more likely to succeed than it did then?

* * * *

Has any consensus of opinion yet been arrived at as to the maximum amount of traffic on a road that renders it more economical to substitute a different kind of wearing surface to that which exists? For instance, when is it more economical to substitute wood for a bituminous surface, or granite for wood?

Town Planning in Relation to Tramways.*

By J. A. BRODIE, City Engineer, Liverpool.

I can appreciate the importance of the relation between improved means of conveyance and the development of town areas, as during the past thirty years I have been directly responsible for the construction of the horse tramway lines and for their relaying and maintenance, and also for the design, construction, reconstruction and maintenance of the electric tramway lines laid within the city of Liverpool. During the greater part of this time my work has consisted chiefly in the carrying out of all street improvements and widenings, as well as the construction of new wide streets and the supervision of building estates involving the provision of new houses for, approximately, 150,000 inhabitants, all of which items form important portions of the work which is likely to come under the general heading now known as town planning.

The main streets and roads have always been the principal feature in the old plans of towns, and they must, I think, continue to form the real backbone and frame to which the details of any effective town planning scheme are to be fitted. The success and prosperity of any town has in the past largely depended on the facilities for traffic, and there can be little doubt that speedy local passenger transport is likely to play a very important part as affecting the development of town areas in the future.

The principal lines of traffic in any large town, if reduced to a simple diagram, will generally be found to show a central area from which lines radiate to the outskirts as directly as the physical features of the area permit. At distances from the centre subsidiary lines for belt traffic are required, and, if properly planned in advance, they can be utilised to assist in reducing the further congestion of the central area. Such a diagram of Liverpool and its immediate surroundings shows that the river Mersey forms an important interference with the lines of the diagram in a westerly direction, while the steep hills encountered in the direction of Everton, lying to the north-east, have hitherto prevented any direct approach through this important and densely populated district to the undeveloped land which at this point is nearer to the central area than at any other.

THE HISTORY OF STREET IMPROVEMENTS

in England shows that, up to the passing of the Town Planning Act, 1909, no general powers existed in this country for the purpose of effectively dealing with street improvements, and practically no variation or improvement of the line or direction of any proposed street, however important, could be introduced, except by agreement with the landowner, without first obtaining special Parliamentary powers for each particular work.

Immediately outside the town boundary matters were worse still, for here the control was in the hands of the small local authority who had not the means to carry out improvements on any proper scale, and Parliament refused to allow the large authority to have any voice in, or to help improvements outside its boundary, without first obtaining special Parliamentary powers.

If the intention of Parliament had been that it should be made as difficult and expensive as possible for public authorities to arrange for satisfactory main lines of communication within and outside a town, then the old powers were certainly well arranged for the purpose.

Some small districts still continue to follow the old line of policy, and even county authorities, who might be expected to take a larger view of the position, have supported them; but, fortunately, many such authorities have taken a more reasonable view, and in the neighbourhood of Liverpool the councils of four large areas lying to the south of the city recognised that they could not deal with the question of town planning on a suitable scale except at—for them—great expense, and these districts have been included by agreement within the city on the understanding that proper schemes are to be prepared, so that there is some prospect of dealing with the southern section of the extended city on proper lines.

It has often been assumed that the proper arrangement of the larger towns has not in the past received much attention in this country as the importance of the subject demanded; but those who have read the old reports are in a position to know that in many cases these towns have, from time to time, given this subject great consideration, and that the blame is attachable rather to the want of foresight of those who, in the past, controlled the purse strings—to the fear of heavier calls upon the ratepayers—and to the lack of powers to assist, and at the same time control development, which powers are so conspicuous a feature in the recent town planning legislation.

As the result of want of powers, combined with want of foresight, many additional roads of much too narrow width have been added in town areas in England, and though about £4,000,000 sterling have been expended in Liverpool during the past fifty years, it can safely be said that none of the most important streets in the old part of the town are of a width in excess of present requirements.

It cannot be said that in any of our English towns heavy expenditure on such improvements are at an end. On the contrary, it is probably not far from the truth to say that a new era of road improvement and widenings is about to commence, and it is therefore specially important that attention should be given to this section of the subject.

Experience in connection with street improvements near the centre of the town shows that about four-fifths of the whole expenditure goes in payment for houses and compensations, all of which would have been avoided if care had been taken to see that ample width for traffic purposes had been originally provided.

In 1908 Liverpool obtained a special Act which gave power to the corporation to control the widths, direction and gradients of all roads likely to become main lines of communication, and either by negotiation or under the powers of this Act about 20 miles of roads, varying from 72 ft. to 120 ft. wide, have been constructed as new roads or as widenings of existing roads, principally on the outskirts.

The powers contained in

THE TOWN PLANNING ACT OF 1909,

if properly exercised, will also be of immense advantage in connection with the provision of main roads, and some of the points which are likely to have a most direct effect on local traffic conditions are, shortly, as follows:

(1) The planning of new areas likely to be developed in the outskirts, and construction of main streets and roads through them.

(2) The replanning and rearrangement of the older congested areas in towns and the rehousing of the displaced inhabitants.

(3) The reduction of the number of houses to the acre.

(4) The purchase of land for housing schemes.

(5) The provision of open spaces, parks, recreation grounds, &c.

(6) The allocation of areas for industrial purposes.

When these points are looked into from the purely surface passenger traffic view it will be seen that, while the four latter may have some effect on the amount of traffic likely to be provided, the really important points are those connected with the planning and provision of the main streets and roads, whether through new or old areas.

An interesting question which arises in this connection is: At what distance apart should such main lines of communication be provided? So far as I can find out no standard on the basis either of distance apart, of population served, or of most economical headway between vehicles has been arrived at, and it appears very desirable that more accurate knowledge as to the population served by any line of tramways should be available. The want of knowledge arises, no doubt, from the fact that hitherto tramways have had to follow such main roads as existed; but if really careful planning is to be adopted these points may require to be more carefully looked into.

The average distance apart of tramway lines at the approximate limit of the closely built-up area in Liver-

* From a paper read at the Annual Congress of the Tramways and Light Railways Association at Newcastle-on-Tyne.

good may be taken at about 800 yds., the average of houses at 100 per acre being about twenty-five per acre, and the average walking distance to the nearest stopping-place being about 500 yds.

In the case of Liverpool, the town planning of the whole of the area lying to the south of the built-up area and within the city boundary is, at the present time, under consideration.

In these districts it will probably be found that tramways will be required, when the buildings are developed, at a maximum distance apart of about 1,000 yds., but this will depend, to some extent, on the number of houses allowed to the acre and other conditions, such as the amount of ground allotted to playgrounds and parks. It will be understood, however, that there is likely to be considerable difficulty in foreseeing what may be the requirements for portions of these districts which may not be fully developed for, possibly, forty years.

Other questions which may arise are:—

At what distance apart should stopping-places be provided on a well-designed system of tramways?

Are travelling facilities likely to be of such importance in the future that stopping-places should be taken into consideration when laying out the internal planning of the areas lying between traffic roads?

If so, should the positions of subsidiary crossroads be determined by the best position for stopping-places?

Or may these points be left to chance as hitherto?

A very considerable change has occurred in connection with all forms of street traffic since the introduction of

THE SELF-PROPELLED VEHICLE

Ample width in the first instance is now a matter of the greatest possible importance in all main thoroughfares where the general traffic is likely to be considerable, and 80 ft. may be looked upon as the minimum width which should be adopted in any important main thoroughfare leading towards the centre of any considerable community.

Where land can be acquired on reasonable terms, as in the outskirts of a large city, the widening of the most important main thoroughfares to 120 ft. can be strongly recommended wherever the street authority and the tramway authority are anxious to provide the best possible accommodation for traffic, and are prepared to work together with this object in view.

The design of the surface of such a roadway is of itself an interesting problem.

In the case of

A 120-FT WIDE ROAD IN LIVERPOOL,

the tramways are laid on wooden cross sleepers on a clinker foundation, the clinker being brought up to the level of the top of the sleepers, and over this soil is laid for grass, the top of the soil being left at the level of the bottom of the head of the rail. The roadways outside the tramway track, where new, are being laid with a clinker concrete foundation with macadam stone embedded in its upper surface, and the wearing surface of these roads is finished in pitch macadam, the traffic expected along this route, though considerable in quantity, being generally of fairly light type.

The arrangements made in regard to the 120-ft. wide road have been of such a character that the total cost of constructing the tramways and additional street surfaces can be carried out to the full width of 120 ft., without any greater cost than would have been necessary to provide for a street only 80 ft. wide with tramways of the usual construction and paved complete.

The cost of construction of a new tramway in Liverpool, including excavation, concrete foundation, permanent way and paving of the highest class, may be taken at about £6,000 per mile of single line, exclusive of the overhead equipment.

On taking out estimates for the simplest form of construction of tramways, which included crushed clinker foundation and ballast, the tramway being laid on cross sleepers and the surface finished in grass, it was found that the cost amounted to about £3,000 per mile of single line, exclusive of overhead equipment, thus showing a saving of approximately £6,000 per mile of double line of route.

It appeared, however, that such a track could not be laid and safely worked at a high speed, bearing in mind the other vehicular traffic, on a road only 80 ft. wide, which was the width originally intended by the street authority.

As the land adjoining a portion of this road, amounting to nearly 2 miles in length, could still be acquired for less than 5s. per square yard on the average, including all compensations, it became feasible, with the difference in cost of tramway construction between the two methods, to purchase a strip of land 40 ft. wide throughout this length, and on a careful consideration of the estimates the tramway authority agreed with the street authority that the road should be constructed to a width of 120 ft. The tramways are being constructed in the centre of the roadway, this area being fenced off from the general traffic by low hedges, and in this way any trespassing on the line will be avoided, and it will be possible for the tramway to run safely at any speed which may be authorised. The tramway undertaking will also have the benefit of the reduced cost of maintenance which the absence of the necessity for removing the paving when repairs or adjustments are required will allow.

The question naturally arises whether such a road will completely meet the requirements of fast services for local passenger traffic, and, if so, how far in the direction of the centre of the town it is possible to carry a wide road of this description, bearing in mind the cost of land and compensation?

THE TYPES OF AREA

which have to be dealt with may be divided roughly into four classes:—

(1) That already described in the preceding remarks in which the cost of land and compensations does not exceed on the average 5s. per super. yard.

(2) An area consisting of portions partly built up with unbuilt portions, gardens, &c., which would bring out the cost on the average to about £1 per super. yard for the land required.

(3) An area still nearer town where the buildings have probably approached the limit of their life which it may be necessary to deal with when rearranging and rebuilding so that it may be brought up to an up-to-date condition; where the cost of the necessary land for widening would approximately be £5 per super. yard.

(4) An area lying in the immediate vicinity of the central area through which the cost of widening roads will be a very considerable item, and where the cost of the necessary land for widening would be approximately £25 per super. yard.

On the basis of the cost of land given in these foregoing classes, estimates have been taken out, it being assumed that, where the road is widened to 80 ft., reconstruction of the whole surface will be required, whereas when widened to 120 ft., the existing roadway for 40 ft. will not require reconstructing. The total cost per mile of the respective classes of roads may be taken, roughly, as follows:—

Class 1.—40-ft. road widened to 80 ft., with paved tramways, £29,000 per mile; if widened to 120 ft., with tramways in special track in grass, £26,000 per mile.

Class 2.—40-ft. road widened to 80 ft., paved throughout, plus tramways, £53,000 per mile; if widened to 120 ft., with tramways laid in special track in centre, £65,000 per mile.

Class 3.—40-ft. road widened to 80 ft., paved throughout, plus tramways, £147,000 per mile; if widened to 120 ft., with tramways laid in special track in the centre, £252,000 per mile.

Class 4.—40 ft. road widened to 80 ft., paved throughout, plus tramways, £616,000 per mile. If widened to 120 ft., with tramways laid in a special track in the centre, £1,190,000 per mile.

I now propose to leave the question of wide roads, and deal with some of the questions affecting

THE FUTURE OF TRAMWAYS.

The main factor leading to success, in my opinion, will be speed. It is, indeed, unfortunate that too narrow and conservative a view has been so generally taken of the advantages likely to accrue to local passenger traffic from road widenings and improvements. If any considerable portion of a surface tramway route is laid along a street upon which, owing to the interference of other traffic, the lack of sufficient widths, awkward turns, or for other reasons, an average speed cannot be maintained which will enable it to successfully compete in the matter of time with other systems serving the same area, the surface tramway system, though to-day holding pride of place in

this country as a means for local conveyance of passengers, is hardly likely to retain that position.

Speeds averaging from 15 to 25 miles per hour are already being given on systems having special tracks not interfered with by level crossings, where operated by electricity, and though a considerable loss of time is usual by reason of the difficulty of approach to the stations and the somewhat inconvenient distance apart of the stops, some of the districts served by such systems are already withdrawing residents, who, while formerly content to reside in town and at a distance of 2 or 3 miles from the centre, to use the surface tramway system, now find it possible to reside outside the city at a three times greater distance from their business, and under pleasanter conditions, with the added advantage of being able to return home in the luncheon hour if they desire to do so.

Increased speed has come to stay, and both the town planning and tramway authorities must be prepared to provide arrangements which will meet the new conditions of life in large towns.

Combined with speed there must be

(1) Safety both for passengers and for the other users of the road.

(2) Comfort for passengers and for the occupiers of frontage property.

(3) Reasonable economy.

From what has already been said it would appear that the average speed should be increased to the neighbourhood of 20 miles per hour, though, owing to the convenience of surface systems and the greater number of stops, a lower speed would probably compete successfully. It is likely that stops would average six to the mile, as against about one stop per mile in the case of trains and two stops per mile in the case of tubes, overhead railways, &c.

Safety can be provided for in the case of fenced-in lines laid on wide streets, as the public and other traffic is excluded between stopping stations, and at stations the speed is of necessity reduced. Where, owing to the narrowness of the roads, a fenced-in track cannot be provided, a good deal could still be done by the street authority for the additional safety of fast traffic in main trunk thoroughfares by dealing with the junctions of side streets in such a way as to slow up any traffic coming in to the thoroughfare from them.

Such an arrangement could be made use of to prevent such traffic coming in on the wrong side or otherwise carelessly.

If speeds are to be increased, as appears to be necessary to enable tramways to contend successfully with other forms of passenger conveyance, the question of

NOISE AND VIBRATION

must be as far as possible eliminated. In the case of other road vehicles the problem has been successfully solved by the introduction of the indiarubber tread, and though the application of the indiarubber or other resilient and silent tyre to tramway vehicles would without doubt introduce some new and difficult problems, these are not incapable of solution by competent engineers, and it appears to be remarkable that such a comparatively simple solution of some of the problems which have been troubling tramway engineers should, so far as I am aware, not have been successfully experimented with.

The addition of some form of rubber tyres to tramway vehicles would no doubt slightly increase the working costs, but it is likely that the life of properly designed tyres would much exceed the life of tyres on motor 'buses or motor wagons, on which a life of 20,000 miles and over is quite common.

It must be remembered also that the addition of indiarubber tyres to the wheels of motor wagons using somewhat roughly paved roads and streets has now been warranted by economical results.

The wear on the rail surface would undoubtedly be much reduced, the cost of maintenance largely eliminated, and possibly the corrugation problem would sink into insignificance.

The other important point in connection with comfort and quietness which still, in many cases, requires attention is the noise of the gears very commonly used.

It can hardly be expected that high speed and more luxurious riding will lead to much greater economy in operation as compared with the present-day slow traffic. There does, however, appear to be an opening for tramway vehicles with a reduced proportion of weight per passenger carried, and lessons may well be learnt from motor-vehicle construction, which has become quite an art, and in which special and expensive materials are largely used for the purpose of reducing the weight to be moved. Motor 'buses capable of carrying thirty-four passengers are being turned out at a weight of about 2 cwts. per passenger, as against about 3·5 cwts. per passenger in the case of tramcar construction.

With regard to the track, economy in first cost and subsequent maintenance is likely to be secured wherever the track can be separated from the ordinary road traffic; but where the lines are laid in the ordinary carriageway, both first cost and maintenance charges are probably now at a minimum, wherever first-class work is done and the very best materials are used. In the case of Liverpool our standard Welsh stone pavement on a concrete foundation has withstood the ordinary steel-shod traffic for periods exceeding thirty years, and in some cases exceeding forty years, without costing 6d. per super. yard for genuine repairs within that time. The repairs of such a surface may, therefore, be taken at a negligible quantity. So good, in fact, was the paving material in Lord-street, which was put down in 1877, that when the cross-sectional levels of that street were altered last year the setts which had been down all that time were again used for repaving the street.

It is therefore evident that the question of the cost of repairing streets within tramway limits and the proportion chargeable respectively to the tramways and street authorities are, in some cases, misunderstood or slightly exaggerated, and that in this, as in most other cases, there are two sides to the question.

WIMBLEDON CORPORATION'S BILL.

The Select Committee of the House of Commons last week passed, with certain amendments, the Bill promoted by the Wimbledon Corporation for an increase of their powers. The Committee refused to sanction Clause 122, which provided that "any pool, gutter, or water within the borough which is a breeding-place for mosquitoes shall be deemed to be a nuisance." They passed a clause authorising the corporation to construct and maintain "Turkish, medicated, and other baths, including baths the efficient properties of which are due to agencies other than water."

With reference to the clause giving the corporation authority to require separate sewers for surface water, the borough engineer (Mr. C. H. Cooper) said there was a sewage farm of 60 acres, surrounded by houses, within the borough, and it was important to the public health that the discharges on that area should be manageable, which was not the case when storm water came down the ordinary drains. Another reason why separate sewers were desirable for storm water was that without them the overflows which followed storms carried foul matter into the streams. There were many separate sewers for surface water already, but they were wanted everywhere, with authority, which did not at present exist, to prevent their connection with ordinary drains. The proposal was approved.

With respect to a provision that the corporation should have the right to prohibit the turning of petrol into the sewers, Mr. Johnson, sanitary inspector, said there were many garages—private and public—in the borough, including one belonging to the London General Omnibus Company, with 15,000 gallons of petrol in store, and another with 3,000 gallons. Not only were sewers damaged by petrol, but it was dangerous to workmen. There had been explosions through the presence of petrol in the sewers, and as long ago as 1907 the authorities issued a notice warning people of the danger. The clause was sanctioned.

Coast Sand Dunes (By Gerald O. Case, St. Bride's Press, Limited, 24 Bride-lane, E.C., price 5s.).—The rapid increase of sand wastes around our coasts is indeed a serious one, and Mr. Case has done a valuable work in the writing of this book.—*Southport Guardian.*

Treasure from the Dustbin.—The dustmen employed by the Brighton Corporation are aggrieved at the decision of the local authority to invite tenders for the disposal of saleable articles collected from dustbins and to pay the men a bonus on the proceeds. Hitherto the dustmen have divided the proceeds, and declare that they have made 5s. a week each in this way.

Institution of Municipal and County Engineers.

THE CHELTENHAM MEETING: GENERAL ENGINEERING SUBJECTS.

Among the papers presented at the recent annual meeting of the Institution of Municipal and County Engineers at Cheltenham was one entitled

NOTES ON THE PROTECTION OF THE FOUNDATIONS OF CHEPSTOW BRIDGE OVER THE RIVER WYE, IN FERRO-CONCRETE

By E. S. SENNOTT, M.INST.C.E.,
County Surveyor, Gloucestershire.

The bridge over the river Wye, which connects the counties of Gloucester and Monmouth at Chepstow, was built about the year 1816. It consists of five spans composed of cast-iron ribs, the central, which is the largest, being 112 ft. at springing level. The total length between abutments being 364 ft.

The cast-iron work (which in the case of the central span has been supplemented in recent years by steel ribs of box section) is carried by four piers, and two abutments, one in each bank.

The piers supporting the central span are respectively on the Gloucestershire and Monmouthshire sides of the centre of the river, and are both substantially in the main waterway. These piers are protected by masonry starlings, having pointed ends up and down stream.

There is no evidence as to the precise nature of the foundations upon which the piers rest, or how they were constructed below low water mark in the first instance. The starlings were composed of a poor quality concrete with large stones bedded therein finished in masonry, and surrounded by timber sheet piling, having diagonal timbering attached to the face with a longitudinal waling at the top. For several years the starlings surrounding both the main piers had shown signs of decay, and during 1902-4 the County Council of Monmouth undertook extensive repairs to the side for which they are responsible.

In the summer of 1910 the writer carefully examined the starling on the Gloucestershire side, and formed the opinion that it would be necessary to remove the whole of the timber work then existing, and replace the same with ferro-concrete piles, making good the cavities as the work proceeded. A complete survey was then made, and certain temporary repairs were carried out to prevent any further disintegration of the old work. Later it was decided to adopt the Hennebique system of piling, and in consultation with Mr. Edmund J. Cullis, ASSOC.M.INST.C.E., who represents Messrs. Mouchel & Partners, in Gloucester, detailed plans were prepared.

The scheme provided for 210 piles (finally increased to 217), varying in length from 10 ft. to 25 ft. (Figs. 1 and 2), connected at the heads by a longitudinal ferro-concrete capping, with ties across the top of the starling in two cross blocks, at the up and down stream ends respectively (Fig. 4).

Owing to the great rise and fall of tide at Chepstow, which at spring is as much as 50 ft., it was necessary to avoid disturbance to the old masonry and concrete as much as possible, and it was arranged that the timber piles should be drawn slightly in advance of the new piles being driven. This precaution was important, as when the new piling was started it was found that the cavities were very extensive, and in some parts the surface of the starling was entirely undermined, almost to the face of the pier; at the down stream end this undermining extended inwards 16 ft. from the apex, forming a cavity of some 50 cub. yds. capacity.

The top of the starling being only 6 ft. above low water of spring tides, the amount of working time available—viz., two hours per tide—was, even under favourable conditions, extremely limited. During some neap tides, and when much fresh water was coming down, no work could be attempted.

The piles were moulded on the Chepstow side of the river, and after six weeks conveyed over the bridge on a two-wheeled bogie, from which they were hoisted by a winch to a wooden slipway laid on the Gloucestershire bank. Proceeding by this slipway to the level of the starling they were taken across a temporary wooden bridge between the first and second piers, and were ready for driving.

The pile frame was of the usual type, being 30 ft. in height; owing to the range of tide, special precautions had to be taken to secure the piles as it was entirely impracticable to drive from boats. The attachment to the old face of the starling consisted of lewis bolts let into the flat stones forming the top surface, the same being fitted with shackles, to which wire ropes were attached. The driving was accomplished by a 30-cwt. Whitaker ram, driven by steam supplied from a Partington vertical tubular boiler, 10 ft. by 4 ft., fixed on the Gloucestershire bank above high water mark, working at 80 lb. to the square inch. The steam was conveyed to the pile engine in a 2-in. diameter iron pipe, the maximum distance being 280 ft.

It was at first a question whether enough steam pressure could be obtained at this distance, but it was found that about 60 lb. per square inch could be relied upon, and this was sufficient for driving the ram. The pitching of the piles, preparatory to driving, involved much care owing to the small space available for movements of men and materials, and the great irregularity of the bed of the river; on several occasions as many as three tides were occupied in getting one pile ready for driving. Before the work of each day could be commenced, the ram, screw pipe and pile generally had to be cleansed from the soft slush and mud which the previous tide had deposited, features all involving delay and slowness of progress. A helmet, constructed of mild steel with wooden buffer, and timber dolly were used between the heads of the piles and the underside of the ram, the maximum drop being 4 ft. 6 in.—as a rule, short drops of 2 ft. or thereabouts were used, when from twenty to thirty blows per minute could be delivered.

The piling was begun in January, 1913, at the up-stream end, and it was shortly found that it would be necessary to lengthen the piles as those at first driven did not reach a secure foundation at the depth anticipated. To ascertain the precise addition which would be necessary, trial wooden piles were withdrawn at different points on the starling, and from the information obtained the lengths finally adopted were arrived at.

In order not to waste any of the piles already constructed, the writer arranged for them to form the lower ends of and to be incorporated in longer piles of larger section. As the result of this plan was quite successful, and the remoulded piles were satisfactorily driven. The piles as finally used varied from 18 ft. to 30 ft. in length. The bed of the river, from 2 ft. to 9 ft. below low water of spring tides, was found to be most irregular; for the greater part large boulders resting in clay were encountered, and the rate of driving was consequently very variable, in some cases a whole week would pass without a single pile being placed; at other times as many as eight per week were recorded, from three to four per week being a normal state of affairs. The apex pile on the down-stream end gave the greatest trouble; this was 30 ft. in length, weighing 31 cwt., and took fourteen days to drive.

It may here be pointed out that, in addition to the difficulties already enumerated, the rush of the water, both tidal and fresh, under the bridge is at all times very great, and the utmost vigilance was required to secure the safety both of men and plant. With respect to the former, a boat with lifebelt equipment was invariably in attendance when work was in progress—for night work the lifebelts were fitted with watertight lifebuoy lights for locating position.

Despite the fact that the operations were carried on continuously day and night for over a year and a-half, no fatal accident occurred, and the pile engine was only once slightly moved out of position. As fast as the piling proceeded the cavities in the old work were filled in. For this purpose bags were used, in which concrete was placed—in the case of the larger cavities blocks of clean stone were inserted between the bags, with considerable saving to the amount of concrete used.

Owing to the irregularity already referred to in the bed of the river, it was found impossible to drive the piles to a perfectly true line, and to get over this it was decided to face the outside of the piles with concrete on expanded metal. This work was carried out from a timber float moored alongside the starling at

dead by water. Timber shuttering was made, inside which the expanded metal was placed, the same being connected to the steel work in the piles which was exposed for this purpose, though, later, special clips were supplied to the piles, to which the expanded metal was secured by [illegible]. The concrete was put in three equally spaced lifts, each a three-day [illegible]. Simultaneously with this work the ferro-concrete capping, cross ties, and

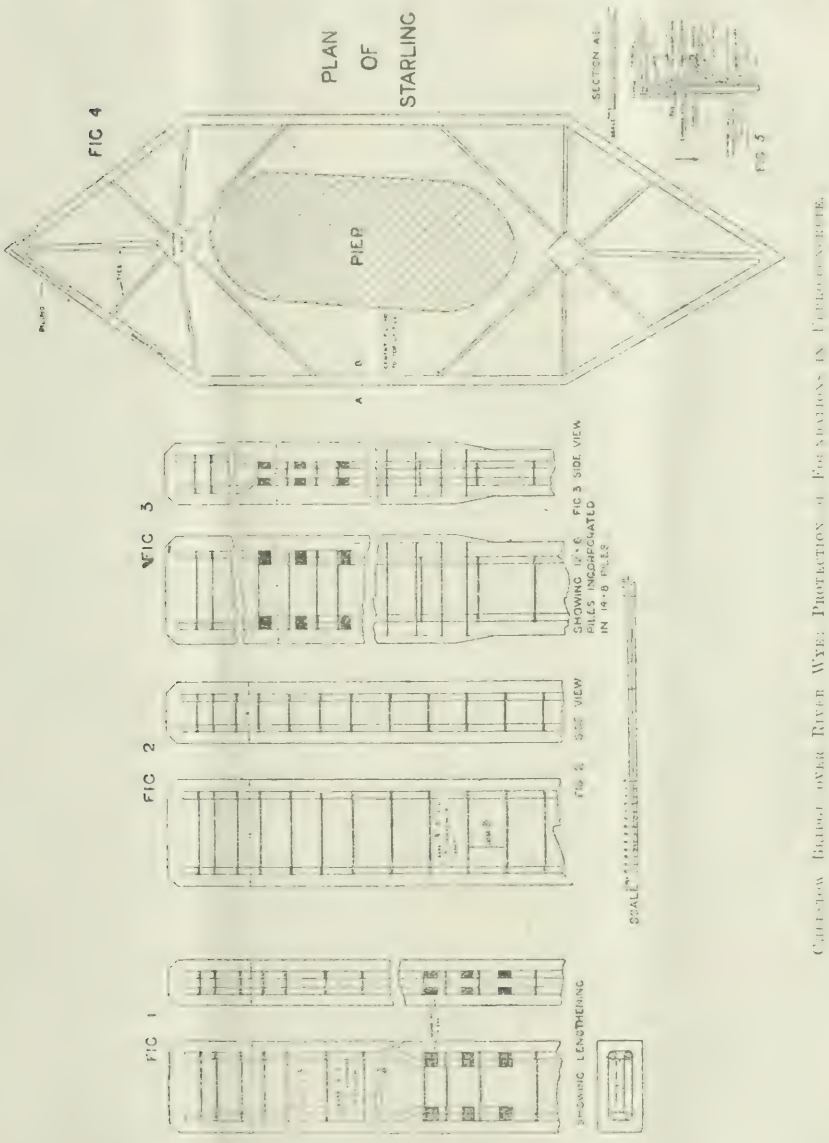
DISCUSSION OF MR. SINNOTT'S PAPER.

Mr. E. Wells (Chiswick) said the paper was useful to those who contemplated works of a similar character. The Society [illegible] very good of members who had had experience in those works to give them the benefit of it. Ferro-concrete was still a new subject, and it was not yet [illegible] to it. It was useful to have a paper such as this included in the Transactions, so that they might study it when they had works of a similar character. They ought to show their appreciation of Mr. Sinnott for giving them the details so fully.

The Chairman (Mr. T. W. A. Hayward) said he should like to say that he sympathised with Mr. Sinnott in the difficulties he had had to contend with in strengthening the foundations of Chepstow Bridge. He knew the locality, and the flow of the river, and he appreciated the difficulties which had to be overcome.

Mr. Sinnott mentioned that if any gentlemen were carrying out similar works, he should be only too glad to give any assistance he could. He had got a good deal of information.

(To be continued.)



anchor blocks were constructed, so that the whole starling was eventually encased in one homogeneous ferro-concrete structure. The spaces between the capping, cross ties and the pier itself were filled in with concrete (6 to 1), the whole being brought to a true surface at the top. This concrete was put in position and there retained by sacking covered with boards, pending its setting.

The contract was carried out by Messrs. Lambrick & Co., of Burton-on-Trent, represented locally by Mr. H. C. E. Goodman, to whom every credit is due for successfully organising and completing an extremely arduous and tedious piece of work.

The writer was represented locally by Mr. E. Larque, of the county surveyor's staff.

Royal Sanitary Institute Congress at Blackpool.

[illegible]

OUTFALL SEWER CONSTRUCTION, WITH SPECIAL REFERENCE TO BELFAST

By James Munro, M.Inst.C.E.
Deputy City Surveyor, Belfast.

[illegible] the author's object in this paper is to ask engineers to take into consideration this particular section of their work, and leave for a [illegible] with the sewage itself which the engineers have collected [illegible] at the place most convenient for getting rid of it, as all they have to do is to dispose of.

As every portion of the country which is not a lake or marsh drains by gravitation to the sea, there is not, except under very exceptional circumstances, any great question involved in designing a scheme entirely depending on pumps.

As a rule, we are of necessity to remove the natural watercourses, but there is no doubt the extension of buildings and streets with impervious surfaces sends the water more rapidly into the outlets, natural or artificial, provided for it. In fixing the sizes of sewers the sewage is the smallest item to be provided for, and the rainfall or surface water is the volume which needs most careful consideration.

The growth of the area within a reasonable period, and the increased use of water as the population increases both in opulence and numbers, must not be neglected. Many communities which a few years ago considered 25 gallons per head an ample supply now use 50 gallons. As sudden rainfalls often multiply the volume to be dealt with by 12 to 15, the positions of storm overflows and their possible effect on the streams or other outlets into which they discharge require careful study.

The problem in Belfast has been one of extreme difficulty. A large area of the city has been reclaimed from the sea, and many acres are so far below high-water level that they are only kept from daily flooding by the quay walls, which are 0·6 ft. above the highest recorded tide and 4 ft. above ordinary high-water. Formerly the sewers all discharged into the harbour or into rivers which in turn discharge into it; they were protected by valves, and only discharged on the last half of the ebb tide. These have now been intercepted, and the area drained by them, and also the whole of the co. Down portion of the city, 5,400 acres, form the low-level drainage area. It will be seen that as no storm overflows are available from the lower portion of this area except at and near the time of low water, storm pumps to relieve the sewers are unavoidable. The intercepting sewers extend for about 3 miles on the co. Antrim side of the river, and rather more on co. Down side, through lands and streets made on the reclaimed areas; they have a fall of at least 2 ft. per mile, and on the portions nearest the river are almost entirely through alluvial deposits known locally as "sleetch," or in filling of all kinds deposited inside the reclamation embankment.

The difficulty of construction in ordinary filling was of the usual kind met with in such material, and is not further referred to. The sleetch is a remarkable material; when dry it crumbles like fine sand; with a little moisture it swells and becomes like a soapy clay; with a quantity of water it has the consistency of soft dough.

The main outlet sewer was constructed for a mile in slob lands of sleetch, which are dry at low water, but covered from 2 ft. to 6 ft. at high water. As an example of the unstable nature of this sleetch, it may be mentioned that when the author was making the surveys for the scheme in 1886 he put a man out of a boat on the apparently firm bank of a channel to fix a pole; he sank so quickly in it that he was rescued with difficulty, yet when the work was being carried out this same bank proved one of the firmest places met with and most difficult to excavate.

When the scheme was laid before Parliament it provided for four cast-iron pipes, each 4 ft. in diameter, surrounded by concrete, as the outfall went into the sea, one-fifth of a mile in length.

The landowners on the lough side objected to the position of the outlet and opposed the Bill. The corporation directed their consulting engineer to meet the adviser of the opponents, both very eminent in their profession, and settle the matter amicably. They agreed to omit the iron pipes, and construct instead a wooden double trough 1 mile long under the slob, with its outlet in deep water. This chute, as it was termed, is constructed of pitch-pine, which was shipped at Galveston, already cut to the scantlings required and floated from the vessel direct to the work. The method of construction was as follows: Two rows of sheet piles were driven of a length sufficient to form a half-tide dam, and constituted the permanent outer sides. The range of tide is 8 ft. in Belfast. When a length of 100 ft. or so had been driven, a cross dam was formed, and when the tide had fallen to the level of pile heads the dam was pumped out and the excavators had about six hours' work before the tide rose over the piles again. When a length had been excavated the centre piles were driven, and the construction of the woodwork completed. When a length was finished, the pile sides forming the half-tide dam were cut off and were sufficiently long to form the centre piles for another length. In due time the chute was completed. Its action in the slob or sleetch was very interesting to those not concerned, but those responsible had many worrying days and sleepless nights over it. One Job's comforter was always giving his views through the Press or otherwise, generally reporting that "it was floating down the lough." It has not done this, although for twenty-five years it has lost many a plank and cost a great deal to repair. Many remedies were proposed for it. Hundreds of tons of old concrete were placed on its top, and strong piles fixed to keep it in its place. It is still there, but is unsatisfactory. He would be a brave man who would attempt or even propose a similar construction again. A ferro-concrete outlet sewer is now being constructed alongside it; when this has been completed the old wooden one will be abandoned.

Lessons to be drawn from the experience gained are that compromises made between rival consulting engineers in the short time available during the progress of a Bill before a Parliamentary Committee are not always satisfactory, and that the considered design of an engineer who knows local conditions should not lightly be set aside.

This new outlet sewer through the slob lands will be in progress for more than another year, and is well worth a visit by any who can afford the time.

The present city surveyor, Mr. H. A. Cutler, M.Inst.C.E., carried out the repairs to the 5,500,000 gallons storage tanks constructed on the slob in a very ingenious way. These tanks were leaking and cracked in the bottom and sides; to rebuild them would have probably cost £40,000, besides the terrible upset to the whole outfall of the sewers. He took one tank at a time and forced cement grout into the crevices and under the floor; altogether 1,120 tons of cement were used. It was mixed with an equal quantity of sand, and was put in under air pressure varying from 7 lb. to 15 lb. per square inch. The reservoir is now quite watertight.

Excavations recently made alongside it show that the grout found all the crevices in the foundation and followed them through the sleetch even 4 ft. beyond the outer walls.

The outfall sewer from junction of the high-level and low-level sewers at No. 1 pumping station to the outfall works is laid along the centre of an embankment about 150 ft. wide, formed of dredgings and sleetch lifted from the harbour during the previous twenty years. There is a timber pond on each side. When the sewer was commenced this embankment was comparatively dry, and the trench stood without timbering; those in charge were charmed, and for a week or two boasted of how cheaply the work was being constructed. Alas for their hopes! A few wet days changed all this, and sheet piling had to be adopted and left in for the entire length of the work to keep the sewer in line. Notwithstanding this precaution the arch cracked from end to end, and had to be made good before the sewer could be used. Some portions of it have spread, and had to be replaced

recently. A road 50ft. wide is now made along the embankment, and forms the approach to the outfall works.

As a relief to the main outfall sewer, and to make it available in times of storm for the increased volume flowing from the high-level area by gravitation, it was arranged to lay a 4-ft. diameter pumping main direct from No. 1 pumping station to the outfall works, a distance of about 1,000 yds.

Before deciding on the use of steel pipes careful examination was made of similar pipes which had been in use for some time as a sludge main from the tanks to the jetty where the steamer is loaded, and also of some others carrying the main outfall sewer under a sea channel; these proved to be in such good condition that the city surveyor had no hesitation in adopting similar pipes for this main.

They are 4-ft. diameter welded-steel pipes, $\frac{3}{8}$ in. thick, with spigot and faucet joints. The material is in accordance with the British Standard Specification, and has a tensile strength of not less than 24 tons nor more than 30 tons per square inch, with an elongation of not less than 22 per cent on a test bar 6 in. long. The pipes were raised to a temperature of 300 deg. to 350 deg. Fahr., and then dipped in a bath of Dr. Angus Smith's bituminous compound kept at a temperature 300 deg. Fahr. during the operation, after which they were covered with a wrapping of asphalted jute. They were then weighed, and the weight painted in white lead on the inside of the socket. When laid, the joints were caulked with gasken and 2¼ in. of lead wool.

One decided advantage in the use of these pipes is the smaller number of joints to be made in bad ground, and the reduction of the volume of underground water which can enter such a pipe.

The amount of subsoil water which finds its way into trunk sewers, notwithstanding all attempts to make them impervious, is very large. Careful investigation in Boston proved that in pipes from 8-in. to 36-in. diameter at least 40,000 gallons per mile per day got into the sewer, and it is estimated that on the average of large trunk sewers, 75,000 gallons per mile per day had to be provided for. These figures have, I believe, been adopted in the reports of the New York Sewage Commission. In waterlogged ground the figures would doubtless be greater.

On the other side of the harbour the subsoil is of an entirely different nature; sand is found in the lower portions, and red clay a little higher up. In the sand the tide rises and falls, evidently following some of the old channels of prehistoric days.

Some years ago, when a 5-ft. diameter sewer was being laid in a street 60 ft. wide, the trench was close-sheeted, and every precaution taken, as the contractor thought, to exclude water; yet he found it almost impossible to keep the trench dry enough to get in the concrete foundation, and claimed 50s. a lineal yard for an extra 6in. depth of excavation and concrete. (It was allowed 9s.)

An examination of an old survey of 1791, which lately came into the author's possession, shows that the site was at that date under the sea, and from other sources it is now discovered that the site was reclaimed about 1833.

Extensions of this sewer several miles in length were made through good ground, but one branch about 1 mile, along what at one time was the margin of the loch, was nearly all the way through running sand. The contractor, however, put on very powerful pumps, and was able to keep the water out of the trench a sufficient time to enable the lower part to be built. Cracks appeared in buildings about ½ mile from the site; fortunately for him, his pumping operations were not suspected.

A relief sewer parallel to the main one referred to is now being constructed about 300 yds. nearer the sea; although the ground is not good, much of it being in-filling, the difficulty of construction is much less than in the case of the original sewer.

Mr. A. E. Collins (Norwich) proposed a vote of thanks to the author, and said he should imagine the conditions of Belfast were such as would almost frighten any engineer who tackled them. One thing that rather puzzled him was that low water was 4 ft. above ordnance level.

Mr. Munce said that was so.

Mr. J. S. Brodie (Blackpool) said he himself had had a good deal of trouble in solving the difficulty of outfall sewer construction, and he could sympathise with Mr. Munce in the difficulties he had experienced at Belfast. He thought a more inefficient proposal and a more unengineering proposal it had never been his lot to look upon than this chute. It showed the futility of these panic decisions before Parliamentary committees. The proposal taken by the corporation of Belfast for cast-iron pipes was perfectly sound and feasible, but when they got to Parliament they heard a lot of imaginary trouble of people living on the banks of the lough, and they had a hurried meeting in the corridor, and an insane compromise resulted in this wooden chute. A more unbusinesslike thing he never set eyes upon. He understood that the cost of the upkeep, which was stated would be about £100 a year, had been more like £1,000 a year. It showed how these hurried compromises were altogether to the disadvantage of the people who were most greatly interested, namely, those who had to pay the piper. He was glad to find that this old wooden chute was going to be abandoned, and a more businesslike outfall constructed.

Mr. Munce, in reply, said the old wooden chute was half full of muck at the present time.

(To be continued.)

Sewage Works Apparatus.—Messrs. Tuke & Bell, Limited, 69 Leadenhall-street, E.C., have received two repeat orders for their sewage ejectors, which speaks well for the efficiency of their apparatus. They had previously put down for the Hayes Urban District Council, for Mr. Fidler, the engineer, two installations, complete with cast-iron tubing, and have received an order this month for a third installation. York City Council, through their engineer, Mr. Spurr, have also ordered from the firm three ejector installations, to be carried out at once at their sewage works.

Manchester Corporation Bill.—The Manchester Corporation Bill, which has passed its third reading, confers upon the town council powers of street widening, including authority for the removal of Cross-street Chapel, the carrying out of a number of tramway extensions, the construction of a new electricity generating station in Trafford Park, the construction of a new sewer in the Stretford district, the borrowing of £1,000,000 for the purpose of obtaining a further supply of water from Thirlmere by means of a fourth pipe, £300,000 for the extension of mains and other purposes in connection with the supply and distribution of water, and the readjustment of ward boundaries.

Law Notes.

Edited by J. B. REGNIER CONDER, 11, Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

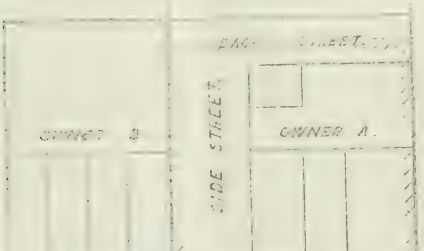
[illegible] plume." Where necessary, specific local facts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only, and in such a size as to be fit for direct reproduction [illegible], without re-drawing or amendment. [illegible] conditions [illegible] to reply to queries.

[illegible] LONDON COUNTY COUNCIL [illegible] ACT, 1911 [illegible] Division [illegible] Justice Joyce [illegible] the powers of the Act 1911 [illegible] Westminster [illegible] Hill [illegible] the purpose of carrying tram-lines down East Hill. For this purpose they served notice to treat with the trustees with respect to the whole of the forecourt of the chapel, except a strip 2 ft. wide. Section 18 of the [illegible] provided that [illegible] shall not [illegible] to take or interfere with the main structure of any house, building or manufactory." The gradients in the neighbourhood were very steep, and the carrying out of the council's scheme would bring the roadway to within [illegible] of the chapel, rendering such access dangerous and almost impossible. Mr. Justice Joyce held that the proposed alterations would not only interfere with, but would practically destroy access to the chapel, making it dangerous and almost impossible, unless extensive alterations were made to the main building; and that the destruction of such access, so as to render it impossible to use the building without extensive alterations, would constitute such an "interference" with the main structure as was contemplated by the proviso. He accordingly granted the injunction asked for by the trustees.

QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words as noms de plume. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

HIGHWAY NOT REPAIRABLE BY INHABITANTS AT LARGE: RIGHTS OF OWNER OF SOIL.—"H. G." writes: B leased a plot of land at the boundary of an estate of a landowner and built cottages right to the edge of land leased. A afterwards leased a plot from the adjoining ground landlord and built property, and included in the lease is the whole width of the side street, shown on plan. This street has been open



over twenty years, but has not been paved and taken over by the council. Owner B has once or twice had repairs done to wall abutting side street, but contractor carrying out the repairs has obtained permission from A to place ladders on the side street leased to A. B recently desired to paint the whole of his wall abutting side street with gas-tar, and A objects to B placing ladders, &c., on his land to carry this out, as he urges that the black colour on the wall would be objectionable to him and damage his light. B then applied to me as surveyor for permission to erect scaffolding on the side street, but my view was that the council could not give permission for this in a street not repairable by the inhabitants, and that, although the public had a perfect right on the street, the right only extended to [illegible] in the [illegible] Can B or A and in the side street to repair his property, or could he [illegible] for twenty years?

(1) Yes, the right of the public is only a right of passage, and the owner of the soil would be entitled to remove scaffolding or ladders placed thereon. Presumably A, as lessee from the owner, has the same right during the term of his lease. (2) In my opinion he cannot. The street is subject to a public right of way, B is entitled to access thereto from any part of his property, but in other respects in law only the same right as the other members of the public. If for twenty years he had from time to time used the street for the purpose of repairing his property wherever he pleased to A's knowledge and without asking A's permission, and without any objection by A, he might possibly have acquired the right to do so.

HIGHWAY, WATERCOURSE.—"F. W. R." writes: In one of the roads in this district, which is now almost covered with house property, there is an old watercourse or ditch, which prior to the development of this district received the surface water from the surrounding agricultural land, passing through the district, and ultimately finding its way into the river. As the neighbourhood developed, and roads were constructed, the owners of the estates appear to have put in pipes for carrying the water under the new streets, some of which pipes are now insufficient to carry off the volume of water in wet weather. In other places the owners appear to have filled in the ditch or watercourse, and in some cases enclosed it, and the result now is that in anything like a severe storm the watercourse overflows into the backs of the houses, and sometimes over their gardens, with serious consequences to the occupiers. (1) What steps, if any, can the local authority take to remedy this nuisance? Please quote authority. No water from any house, or from any street vested in the council, drains into this watercourse. (2) Who is responsible for enlarging or maintaining the pipes under the streets? (a) Where the street is repairable by the inhabitants at [illegible] (b) where the same are private streets.

(1) Any watercourse in such a state as to be a nuisance or injurious to health can be dealt with by the local authority under secs. 91 to 111 of the Public Health Act, 1875. It has been held that it is not necessary that a nuisance, in order to be within this Act, should be also injurious to health. It is sufficient if the nuisance is one which interferes with personal comfort (*Bishop Auckland Local Board* v. *Bishop Auckland Iron Company*, 10 Q.B.D., 138). This nuisance would appear to do so. A "sewer" is not within sec. 21 (*Pelham Vicary* v. *London County Council*, 1897, 2 Q.B., 76); but a watercourse is not usually a "sewer"—at all events until it is extensively used as such (*Regina* v. *Cockermouth Local Board*, L.R., 1 Q.B., 328; *Pentney* v. *Lynn Paving Commissioners*, 12 L.T., 518; *Falconer* v. *South Shields Corporation*, 11 T.L.R., 223; *Wheatcroft* v. *Matlock Local Board*, 52 L.T., 356). I gather that this watercourse does not receive any sewage, and though the point is not free from doubt, I think the nuisance could be dealt with under the above sections. (2) It would appear that the pipes were laid prior to or at the time of the dedication of the streets. This being so, I think the presumption would be (in the absence of evidence to the contrary) that the dedication was subject to maintaining the pipes. If this view be correct, the highway authority would be responsible for the maintenance of the pipes where the street is repairable by the inhabitants at large; but in the case of highways not so repairable, no one would be responsible.

COMBINED DRAINAGE.—"A. R." writes: In a rural district two adjoining houses belonging to the same owner are drained by one common pipe drain into a manure tank. The drain has become blocked, and requires cleansing. The owner claims that the drain receiving the drainage of two or more houses is a sewer, and vested in the rural district council. There are no other houses within a mile, or any public sewers within that distance. Are the council liable to cleanse and make good the drain?

In my opinion there can be no doubt that this is a "sewer" within the statutory definition, from the point at which the drains from the two houses unite, and unless it falls within either of the exceptions mentioned in sec. 18 of the Public Health Act, 1875, it is vested in the local authority, who are responsible for its repair.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to the Editor, 36, Bride's House, 21, Bridelane, Fleetstreet, E.C. Envelopes must be marked "Assistants' Section" in top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the solution considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

THE MONTHLY PREMIUM.

[illegible] is awarded between

Mr. N. S. JEFFREY,
24 Westbrook Villas,

and

M. F. W. [illegible],
[illegible] Hall,
Bexhill-on-Sea.

[illegible] the equation of the [illegible] and [illegible] the width

QUESTIONS.

[illegible] answers are invited to the following questions:

414. Strength of Materials. Prove the formula $\frac{M}{I} = \frac{f}{y}$ and $\frac{M}{EI} = \frac{1}{r}$ with respect to beams, and explain the meaning of the symbols used.

415. Sewerage.—What conditions generally determine the adoption of either the "separate" or the "combined" system of sewerage in a town? ("Ajax.")

416. Concrete Floor.—Give two sections of a reinforced concrete floor for a span of 30 ft., showing the sizes and spacing of the girders, and giving the necessary calculations. (K. G. F., *Buckfastleigh.*)

417. Sewer Construction.—A sewer is being constructed partly in tunnel. Describe a method of giving [illegible] in the heading, referring specially to the continuation of the line of levels from the surface. (Xing.)

418. Iron Curved Roof.—Show details of an iron curved roof of 40-ft. span, resting on girders and [illegible] on one side and on a 14-in. brick wall on the other. The roof is to be covered with corrugated iron. Show enlarged details at the foot of the principal rafter at each end. (K. G., *Buckfastleigh.*)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

411. Foundations for Chimney Shaft.—What calculations are necessary for finding the width and depth of concrete for the foundation of a square furnace chimney shaft, 150 ft. in height, on a gravel soil, and built in accordance with the London Building Act, 1894? (Student.)

The provisions of the London Building Act, 1894, relating to furnace chimney shafts are contained in [illegible], and are as follows:—

Sec. 65.—Unless the council otherwise permit, every chimney shaft for the furnace of a steam engine, brewery, distillery, or manufactory shall be constructed in conformity with the following rules:—

(1) Every shaft shall be carried up throughout in brickwork and mortar of the best quality, and if detached shall taper gradually from the base to the top of the shaft at the rate of at least 2½ in. in 10 ft. of height.

(2) The thickness of the brickwork at the top of the shaft, and for 20 ft. below the top, shall be at least 8½ in., and shall be increased at least one half brick for every additional 20 ft. measured downwards.

(3) Every cap, cornice, pedestal, plinth, stringcourse, or other variation from plain brickwork, shall be provided as additional to the thickness of the brickwork required under this Act, and every cap shall be constructed and secured to the satisfaction of the district surveyor.

(4) The foundation of the shaft shall always be made to the satisfaction of the district surveyor, on concrete or other sufficient foundation.

(5) The footings shall spread all round the base, by regular offsets, to a projection equal to the thickness of the enclosing brickwork at the base of the shaft, and the space enclosed by the footings shall be filled in solid as the work progresses.

(6) The width of the base of the shaft, if square, shall [illegible] of the proposed [illegible] of the shaft; or, if the same is round or of any other shape, then one-twelfth of the height.

(7) Any firebrick built inside the lower portion of the shaft shall be in addition to and independent of the thickness of the brickwork prescribed by these rules, and shall not be bonded therewith.

It will thus be seen that the foundations are left to the discretion of the district surveyor, but the design of the remainder is dictated in the rules given above. The area of the concrete foundation must therefore be calculated as below, and the weight of the chimney must be ascertained. We will assume that the chimney is of the minimum dimensions allowed by the rules; the external dimension at the base therefore becomes [illegible], and the thickness of the brickwork for the bottom 10 ft., 3 ft. 4½ in. The simplest way of calculating the weight is to divide the shaft into sections according to the thickness of the brickwork, and take the length of the mean of the external and internal perimeters at half the height of the section; thus we get:

	Thickness.	Mean perimeter.	Weight of section in tons, assuming brickwork at 112 lb. per cub. ft.
	ft. in.	ft. in.	
Top 20 ft.	0 9	33 8	25·25
2nd ,,	1 1	35 6	39·94
3rd ,,	1 6	37 4	56·00
4th ,,	1 10	39 2	67·19
5th ,,	2 3	41 0	92·25
6th ,,	2 7½	42 10	112·66
7th ,,	3 0	44 8	134·00
Bottom 10 ft.	3 4½	45 8	77·06
		Total weight of shaft	604·15

To this must be added the weight of the footings. Assuming 4½-in. offsets, the number of courses of brickwork required to obtain the required thickness —viz., 3 ft. 4½ in.—will be nine courses = 2·3 high. The weight of the footings is therefore

$$\frac{(15'\,9'' + 21'\,9'') \times 2 \times 3 \times 112}{2240} = 39{\cdot}55 \text{ tons.}$$

making a total weight of 643·70 tons, neglecting the weight of the concrete. Assuming the safe load upon gravel as 3 tons per square foot, we find that 214 sq. ft. are required, which is approximately 15 ft. square. It will be noticed that the area of concrete required to take the footings will be at least 21 ft. 9 in. square, being the dimensions of the footings, there thus being an ample margin of safety if the area of concrete be put at 23 ft. square to give the bricklayers room to work. The depth of the concrete would be made from 4 ft. to 6 ft. deep, according to circumstances. From this example it will be seen that any structure built in accordance with the Act will have an ample margin of safety provided that there is a fairly good soil under the foundations. (J. A. R., *Tunstall.*)

412. **Marine Surveying.** [illegible] at the place required, *i.e.*, in the case of sewage outfalls at the proposed site of the outfall, and allowed to float freely away. They are then followed by a steam launch or other boat, and their positions determined by a sextant [illegible] on land, or two plane tables or theodolites may be set up on land at different points, and the observations made by that means. The observations are taken at fairly frequent intervals, and plotted upon a plan, and the time of the observation marked

Fig. 1.

Fig. 2.

against it. This is done for every float, the separate ones being easily distinguished by different coloured flags, and if a fair curve be drawn between the points [illegible] the path of the float is obtained. While the observations are being taken a tide gauge is being read continuously on [illegible], and plotted to a curve showing the height of the tide at any time. The path of each float is then divided into hourly intervals [illegible], and from the [illegible] and direction of the float and tide for the various states of the tide. The observations should be repeated frequently at different periods of the lunation, both at neap and [illegible] so that the currents are obtained for all states of the tide. By combining a number of such observations a general diagram can be prepared showing the direction of the currents on the flood and ebb respectively. For deep-water observations [illegible] as in Fig. 2 is useful. The observations in general should be taken upon as calm a day as possible, so as to minimise the effect of the wind upon the float. (I. A. E. *Text-book.*)

Mechanical Filtration of Water.—A meeting of the Royal Sanitary Institute will be held at Shrewsbury on Friday, October 9th, when a discussion on "The Value of Mechanical Filters in the Purification of Water" will be opened by Dr. Thomas Orr, medical officer of health to the corporation of that town. The chair will be taken at 7.30 p.m. by Mr. H. Percy Boulnois, M.Inst.C.E. On the following day visits will be made to [illegible] tion, the waterworks and public abattoir. The members will be entertained to luncheon by the mayor.

Traffic on Surrey Roads.—A census of the road [illegible] into the changes in traction. In five years the number of motor-cars passing along the Portsmouth road has doubled, and the number of motor lorries has quadrupled. The motor omnibus has made its appearance since the first census, and now has a figure of 1,235 for the seven days of the census. As compared with 1910, there were 2,000 fewer bicycles, possibly, the [illegible] cyclist has been driven to the quieter lanes and by-paths. In four years there has been an increase in the total number of vehicles from 14,963 to 18,727.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Billericay R.D.C. (July 23rd. Mr. R. G. Hethering[illegible] £9,000 for the purpose of sewerage and sewage disposal.—The scheme, as explained by Mr. J. E. Willcox, of Messrs. Willcox and Raikes, embraces the sewering of the populous portion of the parish of Hutton, together with sewage disposal by means of [illegible] treatment. It is designed for extension, so that eventually the sewage from the adjoining parish of [illegible] may also be dealt with at the same outfall works.

Cardiff T.C. (July 28th. Mr. P. M. Crosthwaite).—[illegible] for a new public water-service main from Lisvane to the Heath filter beds, and thence to the city, and for additional filtering appliances and storage facilities. There was no opposition to the application.

Deptford B.C. (July 29th. Major J. Stewart).—£1,500 for the erection of washing baths in Ilderton-road, South Bermondsey.—It was explained that there would be 18 baths. The proposed scheme will serve a working-class neighbourhood, not a house in which has a bath.

Evesham R.D.C. (July 31st. Mr. C. H. Eyles).—£3,[illegible] for the provision of workmen's dwellings. It was explained by the clerk, Mr. H. E. Wadhams, that the council proposed to erect twenty houses, six on ½ acre of land, each to let at 5s. 9d. a week rent, and six at 3s. 6d., four on 2¼ chains of land, each to let at 4s. 3d. a week, and four on 1½ chains of land, each to be let at 4s. The area of the site was 7 acres 1 rood 37 poles, and the price £80 per acre. The surveyor and sanitary inspector, Mr. E. Holloway, stated that sixteen houses had been erected in the parish in the last ten years. Early in this year there was overcrowding in eight houses in the village.

Feckenham R.D.C. (July 28th. Mr. C. H. Eyles).—£1,940 for the purchase of land and the erection of working-class dwellings at Astwood Bank. It was stated that applications had been made for 25 houses, and that the council proposed to erect ten at present. Mr. W. H. Dicks gave details of the plans prepared, and stated that the tenders had exceeded the estimates by £300.

Fleetwood U.D.C. (July 22nd. Mr. F. H. Tulloch).—£1,772 for works of private street improvement.—The necessary details were explained by the surveyor, Mr. E. Frobisher, and in answer to a frontager the clerk, Mr. A. Cottam, stated that the term of the loans to the owners would depend upon the amounts. The inspector stated that the Local Government Board preferred that only five years be given.

Holmfirth U.D.C. (July 22nd. Major C. Norton). [illegible],500 for purposes of water supply, including the construction of a reservoir to hold more than 100,000 gallons, abutting on Greave-road, and £2,427 for works of sewerage.—Mr. H. Barrowclough, the engineer, offered an explanation of the plans of the water scheme, and subsequently of the proposed works of sewerage.

Penzance T.C. (July 17th. Mr. W. O. E. Meade-[illegible]. £1,350 for the provision of public conveniences at the Morrab Gardens and Alexandra grounds, and for offices and conveniences at the eastern end of the Market House.—It was stated that the council desired to borrow the money for 60 years. The estimate of the work for the public conveniences—which were much needed—was £689, and for the offices at the Market House, £1,125.

Southgate U.D.C. (July 17th. Mr. H. S. Stewart). £10,465 for the erection of working-class houses at Barrowell Green, Winchmore Hill.—The engineer and surveyor, Mr. C. G. Lawson, stated that it was proposed to erect 100 houses of several classes—seventeen with 16-ft. frontages at a rental of 8s. a week; eighty-four with three bedrooms, at a rental of 7s. a week; fourteen with three bedrooms, at a rental of 7s. 6d. a week; thirty-one with two bedrooms, at a rental of 5s. 6d. a week; and fourteen tenements with one bedroom, at a rental of 4s. a week. The roads were to be 40 ft. wide. The site was the best to be found in the district, and was near to a school,

the footways and 2,000 lineal yards of railway. Other works, including water, gas and drainage facilities were executed, and there was also a recreation ground intended solely for the tenants of the cottages.

Stroud U.D.C. (July 29th. Mr. W. O. E. Meade-King).—£1,650 for additions to the public baths, new stables and a roller shed, also the purchase of existing stables in Merry Walks.—The surveyor, Mr. G. P. Milnes, submitted the drawings of the proposed additions to the baths and stables which he had prepared.

Torrington T.C. (July 29th. Mr. H. A. Chapman).—£1,100 for the purchase of land, and the erection of five workmen's dwellings.—It was stated by the town clerk, Mr. G. M. Doe, that the scheme was the result of a visit paid by an inspector of the Local Government Board. The medical officer, Dr. H. C. Parsons, said the site in Well-street was an excellent one, and the surveyor, Mr. W. C. Medland, stated that the estimated price was about £200 per cottage.

Westhampnett R.D.C. (July 23rd. Mr. H. A. Chapman).—£1,550 for the purposes of an Inquiry under Part III. of the Housing of the Working Classes Act, 1890, for the purchase of land and the erection of six working-class dwellings at North Bersted.—The clerk, Mr. W. D. Rasell, stated that inquiries were made by the surveyor, Mr. L. Bell, and his report showed that it was almost impossible to obtain a house of any description in North Bersted. The proposed rent for each cottage was 4s. 3d. per week, exclusive of water-rate, which would amount to 35d. per cottage per week. The cost of the land, which was freehold, was £260, and the council asked that the loan for that amount should be spread over a period of 80 years. They also asked that the loan for the erection of the cottages should be spread over 60 years.

APPLICATIONS FOR LOANS.

Brighton T.C.—£14,700 for the electricity undertaking, and £3,250 for a woman's hostel in connection with the Municipal Training College.

Cleckheaton U.D.C.—£8,085 for electricity plant.

Cheriton U.D.C.—£3,000 for the purchase of land for the improvement of High-street.

Hebden Bridge U.D.C.—£600, supplemental loan for work at the sewage outfall.

Kidderminster R.D.C.—£439 for the Churchill water scheme.

Luton T.C.—£2,122 for road construction, and £878 for works of sewerage.

Newbury T.C.—£1,000 for a new roof for the corn exchange.

North Riding C.C.—£500 for a cookery and handicraft centre at Thirsk.

Porthcawl U.D.C.—£3,000 for works of sewerage.

Southend T.C.—£400 for paving work.

Wanstead U.D.C.—£14,651 for creosoted wood block paving, and £1,372 for road reconstruction.

Westbourne R.D.C.—£120 for works at the reservoir.

LOANS SANCTIONED.

Aylesbury U.D.C.—£21,323 for the erection of electricity works.

Bournemouth T.C.—£4,261 for public conveniences.

Dulverton R.D.C.—£770 for the Brushford sewage disposal scheme.

Epsom U.D.C.—£5,787 for sewerage and storm-water drainage.

Essex C.C. £5,088 for the purchase of a site for a secondary school at Leyton.

Harrogate T.C.—£6,000 for the enlargement of the Kursaal.

Hull T.C.—£20,000 for conversions to the water-carriage system.

Hungerford R.D.C.—£1,600 for the provision of workmen's houses.

Newbury T.C.—£2,000 for gasworks plant.

TOWN PLANNING.

SEPTEMBER.

9.	**Hounslow.** (Mr. Thomas Adams) ...	—

MUNICIPALITIES AND THE WAR.

Yarmouth Town Hall is being converted into a hospital.

Council schools at Grimsby have been taken over as naval hospitals.

The Worthing Urban District Council on Tuesday resolved unanimously to aid dependents of employees called to the colours.

The Salford Corporation has declared its intention of providing adequately for the wives and children of employees called away for service.

At the Lord Mayor's suggestion the Manchester Corporation on Wednesday agreed to allow all Reservists and Territorials in the service of the corporation half-pay while they are serving their country.

SALFORD BOROUGH ENGINEERSHIP.

The Finance Committee of the Salford Corporation have drafted an amended schedule of duties for the position of borough engineer and surveyor, and are recommending the council to invite applicants for the vacant post at a salary of £900 a year, rising to £1,100 per year.

Road Traffic Statistics.—We understand that the Road Board have notified highway authorities in England and Wales that, as any traffic census taken at the present time would not show normal figures, it is considered desirable to postpone the work of census taking in connection with the proposed classification of roads.

Recreation Grounds in Middlesex. As a result of the Middlesex County Council's policy of encouraging local authorities to provide open spaces in the county, since 1897 no fewer than sixty-five recreation grounds, ranging from 1 acre to 172 acres in area, have thus been acquired, the council providing one-fourth of the cost, amounting altogether to £179,458.

A Glossary of Road Terms (By H. Percy Boulnois, M.INST.C.E., St. Bride's Press, Limited, 24 Bride-lane, E.C. Price 2s. net). The movement towards standardising the principal roads throughout the United Kingdom has rendered it necessary to correlate the nomenclature of road terms in use in different districts, and Mr. Boulnois has compiled a glossary with the hope that it may form a basis for such a correlation. *Times Engineering Supplement.*

Motor Traffic and Middlesex Roads.—Mr. H. T. Wakelam, engineer and surveyor for the county of Middlesex, in his annual report states that the heavy motor traffic rendered the improvement of the highways so imperative that during the past year the council had agreed to contribute £146,010 towards resurfacings and widenings, and further expenditure was in contemplation amounting to £372,000, towards which the Road Board has been asked to contribute.

Municipal Work in Progress and Projected.

HOUSING AND TOWN PLANNING.

Derby T.C.—The council last week adopted a town planning scheme submitted by the Improvement Committee.

East Ardsley U.D.C.—A scheme for the provision of twelve workmen's dwellings has been approved.

Eccles T.C.—The council have adopted a housing scheme for the south-east part of the town, the estimated cost of which is £85,686.

Gwyrfai R.D.C.—The council have received the sanction of the Local Government Board to their [illegible] dwellings in the neighbourhood of Ebenezer. The plans were prepared by the council's surveyor, Mr. J. Watkin Thomas, and the work will be carried out under his supervision.

Leeds T.C.—The council last week passed a resolution affirming the expediency of exercising their powers under Part III. of the Housing of the Work- [illegible] Act, 1890.

Newport (Mon.) T.C.—The council at their next meeting will be asked to purchase the Somerton [illegible] Housing Estate.

PARKS AND OPEN SPACES.

Ilkeston T.C.—The Duke of Rutland has presented to the corporation a piece of land for the enlargement of the cricket ground, and has promised to make all the roads around the ground when required at his own expense.—It has been agreed to make a bowl- [illegible]

ROADS AND MATERIALS.

Antrim C.C.—A report from the Public Works Committee has been adopted with respect to the duties of the assistant surveyors. In the Antrim and Ballymena rural districts the work which up to the resig- [illegible] will now be performed by three, and the vacancy caused by the resignation of Mr. Allen will not be [illegible] tricts as follows: To one assistant 347 miles wholly in the Ballymena rural district, to one assistant 364 miles wholly in the Antrim rural district, to one assistant 293 miles partly in Ballymena and partly in Antrim rural districts. The total salary to be paid to these three assistants to be £465 per annum, to be apportioned by us.

Barrow-in-Furness T.C.—It is proposed to make up [illegible]

Bath T.C.—The borough surveyor, Mr. C. R. Fortune, has submitted to the Surveying Committee a report in which he said he had come to the conclusion that the elm blocks had come up to what was expected of them, but that the life could not yet be specified. Three specimen blocks taken from the Old Bridge, High-street, and Charles-street, were submitted for the inspection of the committee, having [illegible]

Boston R.D.C.—There are three district surveyors under the council, and the Highways Committee on Saturday recommended an enlargement of the third [illegible] of Mr. J. Eastgate, so as to include an additional 37 miles of highways forming parts of the parishes of Skirbeck Quarter, Wyberton, Frampton, Kirton, Wigtoft, and Swineshead. The recommendation was adopted, and the salary was fixed at £63, but it was stated that Mr. Eastgate does not give his whole time to the work. Mr. Allen is retiring from the second district, and it was resolved that his successor's salary be £140. The three districts cover 354 miles of road, and the surveyor's [illegible] have worked out at £330, or 18s. 8d. per mile.

Brentford U.D.C.—The tender of the Improved Wood Pavement Company, Limited, at £7 4s. 6d. per 1,000, has been accepted for the supply of 5,000 creosoted fir wood blocks.

Bridlington T.C.—Four schemes have been advanced and are being considered by the Property Committee for the extension of the Royal Prince's-parade and the improvement of the sea front. The proposals include a seaward extension of the parade 100 ft., and the erection of a pavilion to seat 4,000 people. The borough surveyor (Mr. E. R. Matthews) estimates the cost, including the erection of a floral pavilion, at £52,360.

Brighton T.C.—It has been agreed to pay £1,040 for a plot of ground on the west side of Dyke-road, between Melville-road and Addison-road, for the purpose of future street improvement.

Broadstairs U.D.C.—The council have approved the plans of the surveyor, Mr. H. Hurd, for making up part of Pierremont-avenue, at an estimated cost of [illegible]

Carlisle T.C.—The city surveyor, Mr. H. C. Marks, has submitted a report recommending that all the main roads of the city should be made up with tarmacadam, at an estimated cost of £12,500, towards which the Road Board would probably sanction a grant of £4,000.

Hull T.C.—The council have agreed to the proposal of the city engineer, Mr. A. E. White, to lay experimental lengths of wood flooring and asphalte on Cottingham-road.

Manchester T.C.—An important report on the question of congested streets and their remedy has been presented to the corporation by Mr. J. Herbert Thewlis, chairman of the Watch Committee, and the chief constable, Mr. Robert Peacock. These gentlemen received authority from the town council to visit London, Paris, Berlin, Dresden, Munich, Ham-

burg, Vienna, New York, Philadelphia, Boston, Chicago, Toronto, and Montreal, and the result of their enquiry is instructed in a most exhaustive report which deals with the subject historically, comparatively, and suggestively. To meet the congestion due to the increase of motor traffic, tramway traffic, and the obstruction caused by insufficient warehouse loading accommodation it is laid down that the minimum width of any street intended to accommodate a very heavy volume of traffic should be not less than 60 ft. from kerb to kerb. In addition to widenings, the remedies proposed include the construction of new streets, footbridges, subways, and rapid transit lines, Manchester being deficient in rapid transit facilities for suburban passengers. The suggested remedies calling for increased statutory powers comprise the diversion of traffic, limitation of the use of the streets, a speed limit, signalling, and the removal from the streets in an expeditious manner of vehicles which have broken down.

Plymouth T.C.—Schemes have been adopted for [illegible] Park, Devonport, and part of Lockyer Street, and for the [illegible] to the Hoe Promenade.

Poole T.C.—The council have adopted the plan of [illegible] Mr. S. J. Newman, for making up [illegible] under the Private Street Works Act.

Ripon T.C.—It has been decided to remove the old cobble pavement in front of the cathedral, and lay asphalt in its place, at an estimated cost of £40, an amendment that asphalt would destroy the ecclesiastical [illegible] being rejected.

Stockton T.C.—A proposal by the Sanitary Committee that in case the owners of property made default in complying with the notices served upon them under the Private Street Works Act, the borough engineer, Mr. H. Sykes, be authorised to carry out the necessary work, has been rejected in favour of an amendment by a committee for tenders.

SEWERAGE AND SEWAGE DISPOSAL.

Benfieldside U.D.C.—For the new sewage disposal works, designed by Messrs. Taylor & Wallis, civil engineers, of Newcastle-on-Tyne, an order has been placed with Adams-Hydraulics, Limited, for three of their patent "Cresset" sprinklers of 80-ft. diameter.

Horsforth U.D.C.—Another order for a "Cresset" sprinkler of 80-ft. diameter has been placed by the council with Messrs. Adams-Hydraulics, Limited. The surveyor, Mr. H. Brown, is engineer for the scheme.

Llanfyllin R.D.C.—The council have instructed Messrs. Berrington, Son & Watney, of Wolverhampton and Westminster, to prepare a sewerage and sewage disposal scheme for Llanfair Caereinion.

Petersfield R.D.C.—According to the amended plans for the Liss sewage disposal scheme, the estimated cost will be increased from £7,250 to £8,750. The [illegible] has been referred to the Liss Parochial Committee.

Poole T.C.—The council have approved the plans of the [illegible] Mr. S. J. Newman, for [illegible] of the sewage disposal works, submitted to that body.

Smallthorne U.D.C.—The council have adopted the recommendation of the Special Committee appointed to deal with the report of the county medical officer of health, that Mr. R. E. W. Berrington (Messrs. Berrington, Son & Watney), of Wolverhampton, be instructed to survey and report on a sewage disposal scheme for the district and separate areas.

WATER, GAS, AND ELECTRICITY.

Bangor T.C.—The council have approved a scheme of improvements and extensions at the gasworks, at an estimated cost of £1,650.

Brynmawr U.D.C.—The surveyor, Mr. J. J. Quirk, has prepared a scheme for the improvement of the water supply, the cost of which he estimates at £3,500.

Castlederg R.D.C.—It has been agreed to carry out the recommendations contained in a report by Mr. W. Stewart, of Strabane, with a view to the improvement of the water supply.

Eastbourne T.C.—The council are recommended by the Electricity Committee to provide new plant for the electricity works, at a cost of £4,000.

Grimsby T.C.—The Lighting Committee recommend extensions of the electricity undertaking, at an estimated cost of £30,000.

Walsall T.C.—Contracts have been entered into for buildings and plant in connection with the erection of new electricity works, the total amounting to £46,786.

Wednesbury T.C.—In connection with the electricity undertaking it has been decided to purchase for £1,056 a 300-kilowatt rotary converter and transformer with switch gear, and that a building to contain the plant be erected on land belonging to the council at Kings Hill, at an estimated cost of £1,400.

MISCELLANEOUS.

Romford R.D.C.—A sub-committee has reported that it would be in the council's interest that the surveyor should be relieved of all clerical work, so far as possible, to enable him to devote his time to the outdoor duties. And as the clerical work is not sufficient to keep a clerk wholly employed, they recommended, and the council agreed, that a clerk with previous office experience, from eighteen to twenty years of age, be appointed at a commencing salary of 18s. to 20s. per week, to undertake the whole of the clerical work under the surveyor's supervision, and to assist the clerk for an allotted period each week.

Salford T.C.—The Tramways Committee propose to borrow £28,073 for the purchase of tramcars. Of this amount £7,640 is for twelve car bodies without covered tops, but with vestibule ends, and £9,560 for twelve car bodies with covered tops and vestibule ends.

PERSONAL.

Mr. J. R. Heath, deputy surveyor of Stoke-on-Trent, has received an advance in salary from £245 to £270.

Mr. J. H. Castle, assistant borough engineer of Bedford, has been appointed surveyor to the Goole Urban District Council.

Mr. W. Granger, assistant surveyor to the Goole Urban District Council, has been appointed chief assistant to the borough surveyor and water engineer of Loughborough, at a commencing salary of £120 per annum.

Mr. William Brodie, M.INST.C.E., brother to Mr. J. A. Brodie, M.INST.C.E., city engineer of Liverpool, has been appointed principal assistant to the dock engineer under the Mersey Docks and Harbour Board. Mr. Brodie was one of the short-list candidates for the position of engineer-in-chief when Mr. A. G. Lyster retired, and he has been associated with dock work throughout his professional career.

Mr. A. E. White, city engineer of Hull, has resigned on account of the failing health of himself and his wife. He has been in the service of the corporation for thirty-six years, and for twenty-eight years has held the office of city engineer. Mr. White's letter of resignation was read, in the first instance, at the meeting of the Works Committee, the chairman of which, Alderman Larard, said he felt Mr. White had always carried out his duties with the greatest ability, honesty and zeal. They all deplored the fact that he thought the time had come when, on account of his health and that of his wife, he should tender his resignation. A motion of regret at Mr. White's resignation was passed.

FOR OTHER ADVERTISEMENTS
See End of Paper.

LANGPORT RURAL DISTRICT COUNCIL.

ISLE BREWERS WATER SUPPLY.

CLERK OF WORKS.

Wanted for a period of about two months during the laying and jointing of the new Cast Iron Mains and House Connections.

The person appointed will be required to act under the instructions of the Council's Engineer and Surveyor.

Applications are to be sent to the undersigned, and intending applicants are requested to observe that only persons having previous experience of the laying of water cast-iron mains need apply.

Wages Two to Three Guineas per week, according to experience and suitability.

JOS. MATHISON, F.S.I.

Langport.
July 31, 1914. (1,840)

WILLESDEN DISTRICT COUNCIL.

APPOINTMENT OF ASSISTANT ROAD SUPERINTENDENT.

The Willesden District Council invite applications for the position of Assistant Road Superintendent.

Applicants must not be less than thirty, and not more than forty-five years of age, and with some experience as to the maintenance of highways.

Applications, in candidate's own handwriting, stating nature of present employment, with copies of not more than three recent testimonials, to be delivered to the undersigned not later than 4 p.m. on Tuesday, August 25, 1914.

The salary will commence at 3½ guineas per week. A conveyance for travelling will be provided by the Council.

The person appointed will be required to devote his entire time to the duties of his office, and the appointment will be determinable by a month's notice upon either side.

(By order)

C. CLAUDE ROBSON,
Engineer to the Council.

Municipal Offices,
Dyne-road, Kilburn, N.W.
August 5, 1914. (1,844)

RURAL DISTRICT COUNCIL OF MERE.

APPOINTMENT OF HIGHWAY SURVEYOR AND INSPECTOR OF NUISANCES.

The above Council require the services of a competent person as Highway Surveyor and Inspector of Nuisances.

The appointment will be an annual one in each case, and the latter subject to the sanction of the Local Government Board.

The salary as Highway Surveyor will be £100 per annum and as Inspector of Nuisances £50 per annum.

The District comprises 10 parishes, and there are 33 miles of Main Roads and 22 miles of District Roads.

The person appointed will be required to perform the duties of designated officer within the meaning of the Housing (Inspection of District) Regulations, 1910, and Inspector under the Factory and Workshop Act, 1901.

Candidates must be competent to prepare all plans and specifications for works in connection with the highways and improvements thereon, and must be conversant with the requirements of the Highway and Sanitary Acts.

Security in £100 will be required.

Applications, stating age, qualifications, and experience, with copies of three recent testimonials, must reach me not later than 11 a.m. on Monday, the 24th August.

Selected candidates will have notice when and where to attend.

(By order of the Council)

R. HOWARD HISCOTT,
Clerk.

Council Offices,
Mere, Wilts.
August 3, 1914. (1,841)

RURAL DISTRICT COUNCIL OF CLUTTON.

STEAM ROLLING.

Tenders are invited for the Steam Rolling and Scarifying required on the Main and District Roads in this District during the year ending 30th September, 1915.

The mileage of the main roads is about 44 miles, and of the district roads about 190 miles.

Specifications and Forms of Tender may be obtained from the undersigned, to whom Tenders, endorsed "Steam Rolling Tender," must be delivered not later than 8th September, 1914.

The Council do not bind themselves to accept the lowest or any Tender, and the acceptance of any Tender will be subject to the person tendering entering into and paying for a Contract to be approved by the Council.

J. SUMNER DURY,
Clerk to the said Council.

Temple Cloud,
Bristol.
August 5, 1914. (1,843)

BARNET URBAN DISTRICT COUNCIL.

TAR-MACADAM.

Tenders are invited for Providing and Laying Tar-macadam in Wood-street, Barnet, of an average thickness of 4 in., and of a superficial area of about 6,400 super yards, on the following terms:

(1) That the cost be spread over 18 months from completion of the work, in three equal payments.

(2) That the work be guaranteed for 2 years, free of cost.

(3) That the paving be maintained for an additional 3 years at a cost to be stated per yard super.

The Council will prepare the surface of the road for the reception of the Tar-macadam.

Full particulars can be obtained upon application to Mr. W. B. Chancellor, Engineer and Surveyor, No. 40 Highstreet, Barnet.

Quotations, enclosed "Tar-macadam," accompanied with a full description of the stone proposed to be used, together with samples of the same, in an untreated and treated state respectively, must be addressed to me and delivered at the Council Offices, No. 40 High-street, Barnet, on or before the 24th August, 1914.

The lowest or any Tender will not necessarily be accepted.

H. W. POOLE,
Clerk of the Council.

July 29, 1914. (1,846)

WOODFORD URBAN DISTRICT COUNCIL.

FIRE ALARMS.

The Council invite Tenders for the Installation and Maintenance of the "Knight" System of Street Fire Alarms.

Particulars may be obtained from the undersigned.

Sealed Tenders, endorsed "Tender for Fire Alarms," to be sent in not later than noon on Tuesday, 18th August.

The Council do not bind themselves to accept the lowest or any Tender.

WILLIAM FARRINGTON,
Surveyor.

Council Offices,
Woodford Green. (1,845)

OGMORE AND GARW URBAN DISTRICT COUNCIL.

RECONSTRUCTION OF SEWERS, BLAENGARW —CONTRACT No. 2.

The Ogmore and Garw Urban District Council is prepared to receive Tenders for the Construction of a Culvert formed of Brickwork and Concrete, and the Construction of certain lengths of Sewers and Surface-water Drains formed of Cast-iron and Stoneware Pipes of 9 in. in diameter, together with Manholes and Connections, in accordance with the Drawings and Specifications prepared by John Taylor & Sons, civil engineers.

Contractors desirous of tendering may obtain copies of the Specification and Bill of Quantities, with Form of Tender, from the offices of the engineers, Caxton House, Westminster, S.W., upon payment of £5 (cheque only), which will be returned upon receipt of a *bonâ-fide* Tender. The Drawings may be inspected either at the offices of the engineers, or at the surveyor's offices, Council Offices, Brynmenin, Glam.

Tenders, endorsed "Blaengarw Sewerage—Contract No. 2," must be delivered to the Clerk to the Council, S. H. Stockwood, Esq., solicitor, Bridgend, before 12 noon on Friday, the 21st day of August, 1914.

The Council do not bind themselves to accept the lowest or any Tender. (1,842)

BOROUGH OF CHEPPING WYCOMBE.

Tenders are invited for a Two-cell Refuse Destructor with Water-tube Boilers.

Particulars may be obtained from the undersigned, to whom Tenders must be addressed, endorsed "Destructor," not later than Monday, the 24th August, 1914.

The Council do not bind themselves to accept the lowest or any Tender.

T. J. RUSHBROOKE,
Borough Surveyor and Engineer.

25 Easton-street,
High Wycombe.
August 5, 1914. (1,839)

CORRESPONDENCE.

Sir, though I would persuade, I'll not constrain.
Each man's opinion freely is his own
Concerning anything, or anybody.
— MASSINGER. "The Fatal Dowry," Act II., 2

THE DUTY OF MUNICIPAL ENGINEERS.

To the Editor of THE SURVEYOR.

SIR,—A question which seems to me at the present time of the utmost importance to the public is the extent to which the officials of public bodies are bound to assist the State.

Under the Territorial Scheme [illegible] will be called on at the present time to help in the water supply, the lighting, the scavenging, and other municipal services in case of need, so that if, unhappily, the occasion arose he would not find himself unprepared? Cannot he ascertain if the roads and bridges under his charge are capable of withstanding the strain of troops, baggage wagons, and heavy guns making use of them?

Should he not carefully consider how he can assist the military authorities in the selection of temporary camping grounds, and the best methods for the supply of water and the removal of the "waste products"?

Would he not be the best person to advise as to the choice of buildings which might be the most convenient for temporary hospitals, in case of need?

Would not his local knowledge be of the greatest value in settling these and many other points that might arise; and would it not strengthen the status of the profession if the surveyor, when the time comes, was discovered to have already made himself master of these various problems?

It would certainly be helpful if surveyors made suggestions through the medium of THE SURVEYOR as to the manner in which practical help could be given.—Yours, &c.,

H. P. B.

August 5, 1914.

A GOOD EXAMPLE.

To the Editor of THE SURVEYOR.

SIR,—I have the pleasure to inform you that the Metropolitan Board, at a special meeting held to-day, passed the following resolution:—

"That any officer or servant of the board who, as a member of the Territorial or other Reserve (Naval or Military) Forces of the Crown, may be affected by the mobilisation or embodiment consequent on the present European crisis, be allowed leave of absence during his naval or military service; that he be reinstated on his return with no loss of position or emoluments consequent on his enforced absence; that the board pay him (or such other person or persons as he may appoint) during such period such sums as, with the pay he receives from the Government, will make up his full salary or wages; and further that the respective committees be authorised to make such temporary arrangements as may be necessary for carrying on the work of such officers and servants in their absence."—Yours, &c.,

A. B. PILLING,
Clerk of the Board.

August 4, 1914.

"FIRES AND FIREFIGHTERS."

To the Editor of THE SURVEYOR.

SIR,—May I be allowed to inform your readers that Mr. John Kenlon's "Fires and Firefighters" has been withdrawn from sale owing to the unauthorised and unacknowledged use of material collected by the British Fire Prevention Committee? When I published the book, the plates of which were made in America, I was not aware of the obligation under which the author stood to the committee, to whom I have expressed my regret for the occurrence.—Yours, &c.,

WM. HEINEMANN.

[illegible] Bedford Street, W.C.,
July 28, 1914.

Assoc.M.Inst.C.E. Examination.—"W. G.," who asks us to furnish him with a short list of suitable text-books for this examination, is referred to the replies to Question 89 in our issues of June 17th and 24th, 1910.

SOME RECENT PUBLICATIONS.*

TROUT IN LAKE AND RESERVOIRS. A Practical Guide to Managing, Stocking and Fishing. By Ernest Phillips. Price 2s. 6d. nett. London: Messrs. Longmans, Green & Co.

It will come as a surprise to most readers to learn the extent to which our public reservoirs are used for fishing purposes. Mr. Phillips gives a list of over 150 reservoirs containing fish, from most of which the municipality or water authority derive an income produced from the sale of day tickets or of season tickets permitting the holder to fish in the waters. Much information is given that will be of considerable value to those who have control of large reservoirs. The growth of reservoir fishing, and the advantages of stocking reservoirs with fish are dealt with very fully, and much valuable advice is given as to the stocking of reservoirs, the best variety of trout for the purpose, and similar matters. Practical advice to the angler also forms an important part of the book. When it is remembered that such towns as Birmingham, Edinburgh, Bristol, Leeds, Liverpool, and Manchester cultivate fish, and encourage the public to fish in their reservoirs, it is clear that the matter deserves the attention of the water engineer, to whom the book is to be commended.

THE LAW OF FORESTRY. By Benaiah W. Adkin. Price 8s. 6d. London: Sweet & Maxwell, Limited.

A certain counsel, "learned in the law," once lent a standard work ("Chitty on Contracts") to a friend (not a lawyer), who, in returning it, remarked that it seemed to consist of "platitudes and cases." Whatever justice there may have been in that criticism, certainly no such complaint could be made with respect to this treatise on "The Law of Forestry." Mr. Adkin tells us in his preface that he felt it would be unwise to write for members of the legal profession alone, and that he has endeavoured to write so that the book may be useful to land owners, land agents, and others who may be interested in the management of landed estates. Hence, although there are references to about 600 cases and 120 statutes, and though there is no lack of thoroughness in the presentment of the law, nevertheless, neither the historical, the practical, nor the human aspects of the subject are ignored, as is too commonly the case in the ordinary law book. The very interesting introduction touches briefly on the obsolete laws of the forest (reaching back to early Norman times), the new proposals for afforestation (not yet embodied in legislation), the meaning of forestry, the unsatisfactory condition of British woodlands, and the possible remedies for that condition, and forest systems; concluding with "legal definitions," or rather explanations of the sense in which the law uses certain words relating to forestry—a sense often very different from that attaching to these terms in ordinary language.

The main work is divided into two parts. Part I., on the Law Relating to Trees (the principal subject), naturally bulks considerably larger than Part II., on the Law Relating to Trespass and Game. The former expounds the meaning of the term "timber" in its technical sense, and treats at considerable length of timber estates, the ownership of trees, the rights therein as between adjoining owners, tenants for life and remaindermen, landlord and tenant, copyholders and the lord of the manor, heir and executor, vendor and purchaser, mortgagor and mortgagee, &c. There are also chapters on tithes and other outgoings, the rating of woodlands, trees in relation to highways, injury to trees, and the law of forestry in Scotland and Ireland.

The second part treats of property in birds and animals, sporting rights, and the law of trespass and game in the three kingdoms.

We can cordially recommend the work to all who are interested, whether as students or practically, in what Mr. Adkin well terms "the fascinating science of forestry."

Claridge's Asphalte is being used on the roofs of the new County Hall, Northallerton, and Sledmere Hall, near Malton.

*Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

NORTHAMPTON AND EAST MIDLAND ASSOCIATION OF MUNICIPAL ENGINEERS.

The [illegible] meeting of the above Association was held at Northampton on the 29th ult., when there were present about thirty representatives from municipal and county offices and districts.

At a committee meeting held at the close the hon. secretary, Mr. Walton Maughan, reported that, although the membership had been increased during the year, there had been a considerable falling off in the number of members who had attended the meetings. He thought this was largely due to the fact that the Association had not been sufficiently active in arranging visits to works in progress, and he suggested that the Association should endeavour to arrange visits to works in progress in the district, and also to works of interest in other districts. The suggestion was approved, and the matter was referred to the executive committee for consideration.

The members present were received by the president, Mr. Alfred Fidler, M.INST.C.E., borough engineer and surveyor of Northampton, and [illegible] the chief engineer to the association, the various works in hand which were subsequently to be visited. The plans and specifications of the Bridge-street widening and improvement works, which are now being carried out at a cost of about £90,000, the Far Cotton and Kingsthorpe tramway, equal to about 7 miles of single track, extensions to the car sheds, the new South Bridge, and workmen's dwellings were first examined. An item also of interest was a scheme for recording, by means of a radio-telegraph water-level recorder, which is being constructed under the patent of Mr. J. E. Wilson, A.M.INST.C.E., levels of the water in the various reservoirs of the town situate in various parts of the county.

[illegible] the work subsequently the members first of all went to the new South Bridge, which has been designed and carried out by Mr. Fidler at a cost of about £9,000. This bridge is of classic design, and has been built of Derbyshire grit stone. It consists of three spans over the river Nene, and the roadway is 40 feet 6 inches wide in width, is paved with Enderby setts and provided with a double line of tramway track. The tramways and widening works in Bridge-street were next visited, and the company saw [illegible] in the process of making a Thermit joint. Afterwards the party divided, and some members visited various works of interest in the town, and [illegible] the new workmen's dwellings which have recently been put up under Mr. Fidler's supervision. One type of these, which has [illegible] special interest.

A further meeting of the association will be arranged in the course of a month's time, and the hon. secretary, Mr. Walton Maughan, Northampton, will be pleased to hear of anyone wishing to become a member. Members are continued to push-steal men in the district engaged in either civil or municipal and [illegible] meeting.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President Mr. J. S. Pickering, M.Inst.C.E., Borough Surveyor and Water Engineer, Cheltenham.

CLEETHORPES MEETING.

A meeting of the institution will be held at Cleethorpes on September 19th.

SCARBOROUGH MEETING.

A meeting of the institution in the North-Eastern District will take place on Saturday, September 26th, at Scarborough.

J. W. Dudley Robinson, B.Sc.(Lond.),
Secretary.

92 Victoria-street,
Westminster, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

President Mr. Horace Boot, M.I.E.E., M.I.Mech.E.

Next Council Meeting.—The next meeting of the council will be held in London, in September, on day to be arranged.

SOUTHERN & SOUTH-EASTERN DISTRICTS.

A visit to the above districts will be paid to the South Metropolitan Gas Company's works at Tunnel-avenue (near end), East Greenwich, on Thursday, August 13th, at 2 p.m., by kind permission of the [illegible] (Meet at corner of Greenhill-street and Tunnel-avenue.)

EASTERN AND NORTH-EASTERN DISTRICT.

A visit will be paid to Hunstanton on August 15th, 16th and 17th.

There will be no business or other meetings, and ladies and friends of members (including family parties) are specially invited. It will form purely a trip to the seaside, with the opportunity for members to meet on a purely friendly footing.

G. Benson Chilvers,
Hon. District Secretary.

Oundle, Northants.

Meetings will be held at Sunderland on Saturday, October 10th, Newcastle on Saturday, November 7th, and Newcastle on Saturday, December 12th.

A Northern District meeting, in combination with Yorkshire, will be held at Harrogate on Saturday, September 12th.

B. Wyand,
39 Victoria-street, S.W. *Secretary.*

MOUNTAIN ASH.—August 11th.—For the execution of private street works, for the urban district council.—The Surveyor.

HASTINGS.—August 12th.—For the supply and laying of about 2,600 sq. yds. of limestone tar-paving in various streets in the borough, for the corporation.—Mr. P. H. Palmer, borough engineer.

LEEDS.—August 12th.—For works of paving and flagging, for the corporation.—Highways and Permanent Way Department, 155 Kirkstall-road, Leeds.

NEWPORT (Mon.).—August 12th.—For the execution of private street works, for the corporation.—Borough Engineer.

HASTINGS.—August 12th.—For laying 2,600 sq. yds. of limestone tar-paving, for the corporation. —Mr. P. H. Palmer, borough engineer.

ROCHDALE.—August 12th.—For making up certain streets, for the corporation.—Borough Surveyor.

AXMINSTER.—August 13th.—For road improvement works, for the rural district council.—Mr. G. A. Millard, surveyor.

BUNGAY.—August 14th.—For the supply of 345 tons of 1½-in. and 5 tons of 1-in. best broken granite, for the urban district council.—Mr. P. J. Sprake, clerk.

EPSOM.—August 24th.—For the supply of road materials, for the rural district council.—Mr. T. E. Ware, surveyor, Waterloo-road, Epsom.

BARNET.—August 12th.—For [illegible]

LISSINGTON.—September 1st.—For [illegible]

BRIGHTON.—September 4th.—For the [illegible]

Sanitary.

HUNSWORTH.—August 10th.—For the [illegible]

BRIDGE [illegible]

SLAITHWAITE.—August 11th.—For the collection and removal of refuse, for the corporation.—[illegible]

BIRMINGHAM.—August 10th.—For the [illegible] about 7½ miles of cast and wrought iron [illegible] Mr. Henry E. Stilgoe, city engineer and surveyor.

[illegible]—August 8th.—For the supply of [illegible] for the rural district council.—Messrs. Chapman & Snape, engineers, Newcastle-under-Lyme.

ST. MELLONS.—August 11th.—For laying about 370 [illegible] works, for the rural district council.

THORNHILL.—August 12th.—For the construction [illegible] Committee.—Messrs. Crouch, Hogg & Easton, 14 Blythswood-square, Glasgow.

SOUTHAMPTON.—August 12th.—For the construction of surface-water drains at Cosham, near Portsmouth, for the county council.—Mr. W. J. Taylor, county surveyor, The Castle, Winchester.

ASHBY-DE-LA-ZOUCH.—August 13th.—For laying pipe sewer with manholes, for the rural district council.—Mr. S. Turner, surveyor.

TADCASTER.—August 14th.—For the construction of about 160 yds. of 6-in. sewer, with manholes, for the rural district council.—Mr. H. M. Driver, surveyor.

DENTON.—August 15th.—For the construction of twelve new circular percolating filters, together with humus tanks, automatic dividing chambers and other works in connection therewith, for the urban district council.—Mr. J. B. Cooke, engineer and surveyor.

COWBRIDGE.—August 17th.—For the construction of sewerage and sewage disposal works, for the rural district council.—Mr. G. S. Morgan, 23 Gelliwastad-road, Pontypridd.

HENDON.—August 17th.—For sewerage and other works, for the urban district council.—Mr. S. S. [illegible].

CHERTSEY.—August 18th.—For the construction of two circular bacterial filters, 80 ft. diameter, containing a total of 2,248 cub. yds. of destructor clinker; also small humus tank with pipes and appurtenances, for the rural district council.—Messrs. Elliott & Brown, Burton Buildings, Parliament-street, Nottingham.

FLEET.—August 20th.—For the construction of about 16 miles of stoneware and cast-iron sewers, brick, concrete, and cast-iron manholes, flushing tanks, ventilating shafts and columns, cast-iron rising mains, air mains, engines, compressors, ejectors, and other works incidental thereto, for the urban district council.—Mr. T. J. Moss-Flower, engineer, 28 Victoria-street, Westminster, S.W.

MARTLEY.—August 20th.—For the construction of 2¼ miles of 9-in. and 6-in. sewers, with manholes, lampholes, sedimentation tanks, bacterial filters, humus tank, sludge beds, and other incidental works, for the rural district council.—Messrs. Willcox & Raikes, Union Chambers, 63 Temple-row, Birmingham.

RUNCORN.—August 21st.—For the construction of sewers and sewage disposal works, for the rural district council.—Messrs. J. Diggle & Son, 14 Victoria-street, Westminster, S.W., and Hind Hill-street, Heywood, Lancashire.

TOTTINGTON (Lancs).—September 1st.—For the provision and laying of about 8,060 lin. yds. of cast-[illegible] pipe sewers, manholes, and storm-[illegible] chamber, and tanks, and the construction of sedimentation tanks, percolating filters, humus tanks, sludge beds, channels, and diversion of stream course, [illegible] council, Mr. L. Kenyon engineer, Oldham.

ALEXANDRIA.—December 8th.—For the construction of a sewerage system, for the municipality.—"M. le Président de la Commission Municipale d'Alexandrie," Alexandria.

Stores.

HAMPTON.—August 11th.—For the supply of Portland [illegible] cement, clean sharp sand, Scotch [illegible] cement, and cement valves, and timber, for the urban district council.—Mr. S. [illegible] surveyor.

Miscellaneous.

TWICKENHAM.—August 12th.—For the supply of a [illegible] with pumps and fire escape, and [illegible] ment, for the urban district council.—Mr. F. W. Pearce, engineer and surveyor.

MIDDLETON.—August 18th.—For the supply of two petrol-driven motor fire engines, for the corporation.—Mr. F. Entwistle, town clerk.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted. † Recommended for acceptance.
‡ Provisionally accepted.

BRADFORD.—For the construction of a circular outfall sewer in tunnel, for the corporation.—Mr. J. Watson, Town Hall.

J. Best & Sons, Limited, Edinburgh, £121,616.

CHELMSFORD.—For paving Duke-street with creosoted deal blocks, for the corporation.—Mr. P. T. Harrison, borough engineer.

Acme Flooring and Paving Company, Limited, London, N.E., £2,249.
J. Mowlem & Co., Limited, London, S.W., £2,236.
Improved Wood Pavement Company, Limited, London, E.C., £2,193.
W. Griffiths & Co., Limited, London, E.C., £2,163.*

CHELMSFORD.—For the supply of cast-iron pipes for water mains, for the corporation.—Mr. T. P. Harrison, borough engineer:—

Kidman & Sons, Cambridge	3,293
Rooke & Sons, Cambridge‡	3,190

SOUTH SHIELDS.—For the construction of sewers, for the corporation.—Mr. L. Roseveare, borough engineer:—

G. Thornton & Co., South Shields, £280.

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

AUGUST.

15-17. Institution of Municipal Engineers. Visit to Hunstanton.

SEPTEMBER.

19. Institution of Municipal and County Engineers. Meeting at Cleethorpes.

26. Institution of Municipal and County Engineers. Meeting at Scarborough.

OCTOBER

9. Royal Sanitary Institute. Meeting at Shrewsbury. Discussion on "The Value of Mechanical Filters in the Purification of Water." 7.30 p.m.

APPOINTMENTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

BOROUGH OF BEDFORD.
CHIEF ENGINEERING ASSISTANT.

Applications are invited for the appointment of Chief Engineering Assistant in the Borough Engineer and Surveyor's Department.

Candidates must have had experience in a Municipal Engineer's Office, and possess a thorough knowledge of Surveying, Levelling, Building Works, Private Street Improvement Works, Building By-laws, and General Office Routine.

Age 25 to 35. Salary £160 per annum, rising by annual increments of £10 to a maximum of £200.

Applications, in candidate's own handwriting, stating age, qualifications, together with full particulars of experience, and accompanied by copies of not more than three recent testimonials, to be sent to the undersigned not later than Thursday, August 20th, 1914, endorsed "Chief Engineering Assistant."

Canvassing is strictly prohibited, and will be deemed a disqualification.

N. GREENSHIELDS, ASSOC.M.INST.C.E.,
Borough Engineer and Surveyor.

Borough Engineer and Surveyor's Office,
Town Hall,
Bedford.
July, 1914. (1,821)

COUNTY COUNCIL OF SALOP.

Wanted, immediately, in the County Surveyor's Department, an Engineering Assistant, for Road Improvement Work, at a salary of £3 3s. per week.

Candidates must be competent Surveyors and Levellers, proficient Draughtsmen, capable of designing ordinary county works, and preparing specifications for same, and experienced in the routine work of an Engineer and Surveyor's Office, and especially in the keeping of the prescribed forms and accounts connected with Road Board grants.

Applications, on Forms to be obtained from the undersigned, stating age, training, qualifications, present employment, and past experience, accompanied by copies of not more than three testimonials of recent date (which will not be returned), and endorsed "Assistant," must be received by the undersigned not later than Monday, August 17th, 1914.

A. T. DAVIS,
County Surveyor.

County Buildings,
Shrewsbury. (1,831)

CONTRACTOR'S AGENTS required, with Civil Engineering experience. Salaries from £250 to £350. Apply, in writing, to the Secretary, Anglo-Mexican Petroleum Products Company, Limited, Finsbury-court, London, E.C. (1,809)

ASPHALTE PLANT.—Engineering Firm, specialising in the manufacture of this, require the active services of a gentleman with £3,000 to extend. Splendid opportunity, owing to New Road Making methods. Present machinery working to fullest extent and orders being refused, early deliveries being impossible.—Box 1,450, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,823)

URBAN DISTRICT COUNCIL OF FLEET, HANTS.

FLEET SEWERAGE AND SEWAGE DISPOSAL WORKS.

CLERK OF WORKS

[illegible] (about 18th September, 1914.)

The Council invite application for the above appointment. Candidates must be thoroughly experienced in the construction of modern Sewage Disposal and Drainage Works, and able to efficiently discharge the duties required of Clerk of Works on works of this kind, and must be competent with the use of the level and theodolite, and be able to set out and measure works. No others need apply.

He will be required to act under the direction of Mr. T. J. Moss-Flower, C.E., Engineer for the Works.

Salary £4 4s. per week.

Time about 18 months, subject to approved services.

Applications, marked "Clerk of Works," stating any previous experience, and enclosing copies of three recent testimonials, to be sent to the undersigned not later than three o'clock on Thursday, 27th August, 1914.

W. H. WRIGHT,
Clerk to the Council.

Council Offices,
Fleet, Hants. (1,834)

HESTON AND ISLEWORTH URBAN DISTRICT COUNCIL.

SECOND ASSISTANT SURVEYOR.

The above Council are prepared to consider applications for the appointment of Second Assistant in the Engineer's and Surveyor's Department. The person to be appointed must be a good Draughtsman and Surveyor, and possess practical knowledge of the work of a Municipal Engineer's Office. Preference will be given to candidates who hold the diploma of the Institution of Municipal and County Engineers, and who have had experience in the preparation of Plans, Specifications, Estimates and Quantities. Age not to exceed 28 years. Salary £100 per annum, rising, subject to satisfactory service, by annual increments of £10 to a maximum of £120.

Applications, on Forms to be obtained from Mr. J. G. Carey, ASSOC.M.INST.C.E., Engineer and Surveyor, Council House, Hounslow, together with copies of three recent testimonials, to be sent to the undersigned not later than noon on Wednesday, the 12th August, 1914, endorsed "Second Assistant Surveyor."

Canvassing will be deemed a disqualification.

(By order)
H. J. BAKER.
Clerk to the Council.

Council House,
Hounslow,
30th July, 1914. (1,827)

TEMPORARY SURVEYING ASSISTANTS.

Required, in the Office of a Borough Surveyor to a County Borough, two temporary Surveying Assistants to carry out work of referencing owners and preparing plans for an extensive Town Planning scheme. Preference will be given to applicants who have had experience in the work of Town Planning. The persons appointed will have to devote the whole of their time to these duties.

Applications, stating age, experience, qualifications, and salary required to be sent to Box 1,452, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,837)

ENGINEERING AND TOWN PLANNING ASSISTANTS.

Wanted, two Engineering Assistants for Municipal Office of large City in the North. One, expert in Town Planning, Surveying, Contouring, and Laying Out of Garden Cities. The other, experienced in the Laying Out of Sea Fronts (pier, sea walls and groynes), and capable of taking part in the General Engineering Work of the City.

Apply immediately, stating age, full particulars of training, present appointment, and salary required, *not to exceed £3 per week.*

Apply Box No. 1,453, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,836)

ISLE OF THANET RURAL DISTRICT COUNCIL.

[illegible] Council [illegible] Town Planning Act, 1909, and the Regulations made by the Local Government Board thereunder, in connection with Town Planning.

[illegible] undersigned. When completed it should be returned to me not later than the 13th instant. The appointment [illegible] 27 [illegible].

Canvassing strictly prohibited.

[illegible]

CHAS. TAYLOR.
Clerk.

[illegible]
August 1, 1914. (1,835)

TENDERS WANTED.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE; *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

SHEERNESS URBAN DISTRICT COUNCIL.

SHEERNESS WATERWORKS

CONTRACT No. 8

TO BUILDERS AND CONTRACTORS.

The Sheerness Urban District Council invites Tenders for the demolition of the Beam Engine-house, &c., at the Trinity-road Pumping Station, and for the construction of a new Engine-house and other works on the site thereof.

Plans may be seen, and copies of the Specification, Bills of Quantities and Form of Tender obtained, on and after Tuesday, the 4th August, either at the office of the Engineer, Mr. F. W. S. Stanton, Assoc.M. Inst.C.E., 3 Victoria-street, Westminster, S.W., or at [illegible] Offices, Trinity-road, Sheerness, on payment of Two Guineas (cheques only), which will be returned [illegible] Tender.

[illegible] from the printers on production of a signed permit to them, but such prints must be delivered to the [illegible] before the deposit [illegible].

The Beam Engine-house and the site of the work [illegible] application to the Resident Engineer at the Pumping Station.

Sealed Tenders, endorsed "Tender for Sheerness Water [illegible] No. 8," to be addressed to me, [illegible] on or before Monday, the 7th September, 1914.

Parties tendering must do so at their own expense.

The Council does not bind itself to accept the lowest or any Tender.

(By order)

VINCENT H. STALLON,
Solicitor,
Clerk of the Council.

Council Offices,
Sheerness.
July 27, 1914. (1,838)

COUNTY BOROUGH OF HASTINGS.

TO TAR-PAVING CONTRACTORS.

The Corporation are prepared to receive Tenders for the Supplying and Laying of about 2,600 square yards of Limestone Tar Paving in various Streets in the Borough.

Specifications and Forms of Tender may be obtained at the Office of the Borough Engineer, P. H. Palmer, Esq., M.Inst.C.E., Town Hall, Hastings, during office hours.

Sealed Tenders, endorsed "Tender for Tar Paving," to be delivered to me by 12 o'clock noon on the 12th day of August next.

The Corporation do not bind themselves to accept the lowest or any Tender.

BEN. F. MEADOWS,
Town Clerk.

Town Hall, Hastings.
July 25, 1914. (1,830)

SWIMMING BATHS WATER PURIFICATION.

IMPORTANT TO MUNICIPAL AUTHORITIES:

Is the water in the Swimming Ponds under your control **always** clear, free from any dullness, and equally bright and attractive **at all times?**

Are the bathers satisfied they can obtain equally good conditions of bathing **every day?**

Is the water free from all **brown stain?** Can you distinctly see a hairpin lying on the bottom of the pond at the deep end?

Unless these questions can **all** be answered in the affirmative, why not adopt our System of Purification, whereby we will guarantee to fulfil all the above conditions with complete success? At the same time the cost of water saved annually will in a few years pay for the plant.

By our System of **Treatment** and **Sterilization** of the water, not only is its Chemical and Bacterial Purity maintained, but freedom from all **disease-germs** is absolutely ensured.

Send us Architect's plans of the baths, and we will furnish Estimates and Plans of the apparatus free. Please at the same time refer to our guarantee.

WRITE FOR PAMPHLET

BRIGHOUSE.

The Surveyor

And Municipal and County Engineer.

Vol. XLVI. AUGUST 14, 1914. No. 1,178.

Minutes of Proceedings.

The Romance of Road Making.

In the course of a recent research among back volumes of The Surveyor we noticed that our issue of July 21, 1899, contained a paper by a former borough surveyor of Wolverhampton in which there were some interesting references to "The Literature of Road and Street Construction." It occurred to us, while glancing at this paper, that any future bibliography of road making might very well include some references to the more purely literary, imaginative and poetic aspects of the subject. For example, in Isaiah xl. 3, 4 and 5 we read: "The voice of him that crieth in the wilderness, Prepare ye the way of the Lord, make straight in the desert a highway for our God. Every valley shall be exalted, and every mountain and hill shall be made low: and the crooked shall be made straight, and the rough places plain; And the glory of the Lord shall be revealed, and all flesh shall see it together: for the mouth of the Lord hath spoken it." Here the imagery is undoubtedly derived from the road engineering work which was the necessary preliminary to the progress of a powerful Oriental despot and his retinue through a wild and unfrequented region. In a flat country, of course, and for a merely temporary purpose, the work would be chiefly of a surface nature, in which the "valley" to be "exalted" would be no more than a hollow to be filled, and the "mountain and hill" no more than a hump to be removed. Passing from the Old Testament to the New, and from thence to our own times, it was from the Vulgate Latin version of John xiv. 6 that Dr. Guglielminetti took his inspiring, though incomplete, motto, "Via Vita." We call it incomplete because there is every reason for retaining the connecting "Veritas" of the alliterative Latin version. In plain English, "way" is not "life," nor the means of life unless it is both made and used with "truth." Otherwise, the way itself may be too treacherous to bear the traffic, and the traffic may be that of death-dealing "road hogs," or invading armies, instead of the traffic of civilising commerce and friendly, humanising intercommunication. In this connection Kipling's fine lines may afford a good English motto for the road surveyor, the civil and the civic engineer: "Keep ye the Law—be swift in all obedience. Clear the land of evil, drive the road and bridge the ford." In fiction there is the excellent novel by Mr. A. W. E. Mason entitled "The Broken Road," the said road being, if we remember rightly, somewhere in India. And if, at this time of serious public and private anxiety, any road surveyor or road engineer can command sufficient leisure and calmness of spirit to indulge in a little light reading of a sentimental but harmless—and possibly even helpful kind—he might do worse than peruse "Her Grace Duchess Annabel," a story by "Betty Beggs," contained in the *Family Herald Supplement*, bearing to-day's date, but really published a week ago. The hero is a red-haired giant who answers to the honest plebeian name of "John Smith." He is a Colonial, but as to whether he is a Canadian or an Australian the authoress betrays a rather unnecessary and almost ludicrous incertitude. His profession, however, is left in no such uncertainty, for he is a road surveyor. The heroine, a wealthy dowager duchess of thirty, by birth and breeding Irish, and unconventional, is thus addressed by her jealous cousin, Lord Buzzant: "You are one of the greatest ladies in England. Smith is a road surveyor—neither more nor less—a man with a paltry five hundred a year, who spends his life camping out in the wilds. The thing is impossible—it is preposterous!" Nevertheless, "the thing" she contemplates comes to pass, and the story has a happy ending, not because John Smith is an expert at "levelling," but because of the fine human qualities of himself and the duchess. Far be it from us even to appear to emulate the callousness of Nero, who fiddled whilst Rome was burning; and unmarried, unengaged surveyors will not need to be told that they cannot all wed dowager duchesses, even if they wished to do so, for they will know that there are not enough of the latter to go round. We must not idly dream either of an irrevocable past or an unlikely future; we must act and be ready to act in the living present. Our fighting forces are much in evidence just now, and, if necessary, most of us—without distinction of age or sex—would risk all to preserve our national existence. But it is significant and encouraging to find a woman novelist taking as her hero, not a military or naval officer, but a man of peace, a creator rather than a destroyer, "a road surveyor—neither more nor less."

* * *

The Importance of Geology.

Among the subjects which should be included in the general training of every civil engineer, no matter to what special branch of the profession he intends to devote himself, one of the most important is undoubtedly that of geology; and perhaps this applies with peculiar force to the municipal engineer upon whose advice may depend the success or otherwise of underground water supplies, the economical execution of works of sewerage, and many other works the cost of which is largely determined by the nature of the geological materials met with in the course of excavation either in trench or tunnel. It must also be remembered that some knowledge at any rate of the geology of building stones, road metals, and other similar materials ought to form part of a complete technical equipment. Dr. Herbert Lapworth therefore did well to emphasise the importance of a study of geology in the paper on "Applied Geology in Municipal Engineering," which he read at the recent annual meeting and conference of the Institution of Municipal and County Engineers at Cheltenham. Most municipal engineers are familiar with that type of dispute with contractors which arises from some misunderstanding in regard to the nature of the ground in which the work is located.

causes of this kind of trouble. It often arises from [illegible] inadequate or misleading descriptions of the strata in which the work is to be executed, the information given being usually derived from trial holes or borings; but perhaps an equally frequent cause [illegible] construction unsuited to the kind of ground unexpectedly encountered in the trenches or foundations. In either case the engineer with a practical working knowledge of geological phenomena is less likely to fall into error. Dr. Lapworth gave an interesting example of a dispute which was the direct result of sinking trial holes clear of the line of the work. The trial holes, in order to save expense, were sunk in a railway cutting parallel to the sewer. These proved the ground to consist entirely of sandstone and conglomerate, whereas at least half the length of the tunnel was found to be in marl, the discrepancy being due to the cross dip of the strata. In the sandstone and conglomerate the tunnel was driven without timber, while in the marls close timbering was required throughout owing to falls from the sides and roof.

In regard to water supply, in addition to a knowledge of geology, a firm grasp of the principles of hydro-geology is also necessary in order that the engineer in the course of his investigations may utilise to the full, and with some approach to scientific accuracy, the data which he obtains from local wells and springs in determining the underground water resources of the district, and in taking precautionary measures to avoid the pollution of the supply. In ordinary sewer construction, perhaps, the geological considerations are more simple, although they become more important as the depth of the excavation increases. Where, however, questions of surface protection and the purchase of underground minerals arise, a sound knowledge of local geology and its practical bearing on the possibility of subsidence is of very real consequence. We are glad to observe that Dr. Lapworth did not conclude his valuable paper without a reference to the desirability of placing the occurrence and petrology of road stones upon a scientific basis. A good deal of very useful work has been done in this direction in recent years, and the tribute paid to the early labours of Lovegrove, Howe, and Flett was well deserved. This pioneer work has since been supplemented in many directions, and a great deal is still being done. The importance of the subject is such, however, that we ought not to rest satisfied until—to use the concluding words of Dr. Lapworth's paper—with the establishment of courses in highway engineering at the universities, so strongly urged recently by Mr. H. Percy Boulnois, scientific research in this direction may be stimulated, and in conjunction with the practical results and experiments of road engineers, a new technology, for which there seems to be a considerable need, may be evolved.

* * *

War and the Surveyor's Duty.

It is a matter for congratulation that there are a number of municipal and county engineers who hold commissions in various branches of the Territorial Forces. Their duties are clearly assigned to them. For those who remain at their civil posts there is much that can be done to assist the country in the greatest crisis that has confronted it since the time of Napoleon. As we have already pointed out, they can at once arrange, if they have not already done so, for the protection of our water supplies and other municipal works. They can study their districts, and be ready to advise the military authorities on points of detail if they are called upon to do so. They can look to their roads and bridges and [illegible] themselves that these are strong enough to withstand the movements of troops, guns, baggage, and so forth, which at any moment they may be called upon to bear, and, if not, decide what temporary measures can be adopted at short notice to strengthen them. But, in addition to these obvious duties, there may come a time, and that not very distant, when there may be unemployment and distress on a very large scale, when relief works will be urgently required. The municipal engineer should be fully prepared for this emergency, and should at once set to work to discover what suitable works in his neighbourhood could be carried out. Unfortunately, ordinary road construction work is not for the unskilled labourer, except as regards a very small proportion of it, at any rate; but there may be road improvements in connection with which a considerable amount of excavation, or filling in, may be necessary, and for such work any man capable of wielding a pick and shovel is more or less useful. There may be old quarries or depressions which could be filled in and levelled; there may be work in the public parks requiring manual labour. In some localities works of sea defence might be commenced; in others land reclamation is a work where an enormous amount of unskilled manual labour can be employed. There are some districts in which derelict canals exist and could be filled in and the land used for agricultural purposes; or, if found better, these might be drained and prepared for electric light railways. Although breaking stones by hand is unpopular, as it savours of the workhouse, a very large amount of unskilled labour could be usefully employed in this direction. There are very few depots which do not contain a large accumulation of spalls and waste material which could be broken up by hand and used for the "bottoming" of roads and streets as required, although it might be unsuitable for surfacing. There are no doubt many other relief works which might be suggested from local knowledge, but the point to be urged is that every surveyor throughout the country can do much at the present crisis to relieve the strain when it comes. To be prepared and not to have to act in a panic is the sure road to success, and no doubt every municipal and county official throughout the land is at the moment doing his best to assist the nation in its present critical situation.

* * *

The Government's Example.

The Government are giving an excellent lead in regard to the principle of giving relief through work rather than charity. Thus, the Office of Works have stated publicly that they intend to proceed with all services in their charge, to employ as many men as possible to carry out such services, and to develop and expedite their building programme in any way practicable. As the Minister mainly responsible for Government building, the First Commissioner of Works has expressed his sincere hope that private individuals, companies, firms, and contractors will spare no effort to follow the policy of the Government in this matter, so far as circumstances admit. We understand, too, that an official circular has been issued to the local Emergency Relief Committees which are being formed under the direction of the Cabinet Committee on Distress, urging upon them and upon the local authorities the importance of pushing forward public works as a means of preventing unemployment. A certain obligation, too, rests upon the Development Commissioners and the Road Board, for the Act under which these bodies were constituted provides that in approving, executing, or making advances in respect of any work under the Act involving the employment of labour on a considerable scale, regard shall be had so far as is reasonably practicable to the general state and prospects of

employment. It appears probable, therefore, that the coming winter will witness much activity in the construction of public works, and that those whose business depends upon the building industry are likely to experience less dislocation of business than might at first have been anticipated. At all events, the Government, although neglecting reasonable precautions, they, in common with those who will probably suffer most, may well be content "to get their quiet ways."

* * *

Technical Education.

Much has been written from time to time concerning the relative advantages of a college training and the serving of a term of pupilage as a preparation for entrance to the engineering profession. Any comment which we ourselves have made upon this rather vexed question has been to the effect that the ideal to be aimed at is the perfect union of theory with practice. If the purely college-trained engineer is apt to be pedantic, he still has considerable advantages over the man who is so "practical" that he has no intellectual apprehension of anything beyond mere rule of thumb. Whatever opinions may be held upon the general question, however, there can be no doubt as to the excellence of the provision that is being made by some of the newer universities for the education of the new generation of engineers. A pleasing and satisfactory feature of some of the schemes of study which have been devised is the recognition of municipal engineering as a separate and distinct branch of the profession, of such importance as to merit the holding of special classes and the conferring of special diplomas. As an example of this we may mention the University Courses in the Manchester Municipal School of Technology, a copy of the prospectus of which is before us. This school has developed from the Manchester Mechanics' Institution, founded in 1824, until to-day it is of university rank, and attracts students from all parts of the world. The university courses just referred to include first, second, and third year courses in municipal and sanitary engineering leading to the degrees of Bachelor and Master of Technical Science. The first year course appears to be designed principally to lay a good foundation in those subjects which are applicable to all branches of the engineering profession, while the work over the whole period is so planned as to afford a proper combination of theoretical training with laboratory practice and drawing office experience. Another syllabus of which we have received a copy is that of the Faculty of Engineering at University College, London. This is of special interest, because the course in municipal enginering is under the direction of Mr. E. R. Matthews, ASSOC.M.INST.C.E., the recently appointed Chadwick Professor. The subjects of instruction here include water supply and waterworks construction, sewerage and sewage disposal, lighting, roads, street paving, and tramways, and town planning from an engineering aspect. It will be seen from the foregoing that the opportunities for systematic technical training are better at the present time than ever before, and it behoves the youthful aspirant to honours in the engineering profession to keep a good lookout and to seize every chance which comes within his range of equipping himself for the thoroughly efficient discharge of his future duties.

An Important Decision.

In our last issue we noticed a decision of a Select Committee of the House of Commons which may form a precedent of a far-reaching character. The point arose upon the consideration of a Bill the object of which was to provide the town of Weston-super-Mare with an improved water supply, and it had reference to the liability, as between the county council and the urban district council, for the cost of moving certain water mains in the event of the necessity arising owing to alteration or improvement of the main roads under which they were laid. The county council asked for the insertion of a clause providing that in such cases the expense should be borne by the district council, and the Committee unanimously decided to amend the Bill so as to secure this end. The general policy of the Public Health Act, 1875, with regard to this matter as between a local authority and a company is that the former must not only bear the cost of any necessary removals, but that no alteration of a company's works which will permanently injure the pipes, mains, plugs, or works, or prevent the water from flowing as freely and conveniently as usual shall be required or made. To this provision, however, there is a proviso to the effect that where, under any local Act of Parliament, the cost of removal is directed to be borne by the company, their liability shall continue, notwithstanding anything contained in the general Act. It will be seen, therefore, that the effect of the decision on the Weston-super-Mare Bill is that the district council will be placed in a position analogous to that of a company to which the proviso just quoted applies. It would appear that the point is one which ought to be settled once and for all on principle, instead of being dealt with piecemeal in individual Bills. Our own view is that the placing of mains under highways is a privilege, and that any cost to the public involved by it should be borne by those who desire the benefit. If the Weston decision became stereotyped, effect would be given to this view.

The Kempston Surveyor's Extra Services.

A lively imagination is an excellent thing when it is directed in the proper channel, but it is obviously an undesirable quality when it is used for the purpose of depriving a professional man of that which is properly due to him. At a Kempston (Beds) Urban District Council meeting recently the Sanitary Committee submitted a recommendation to pay the surveyor, Mr. A. H. C. Inskip, £70 for extra services in connection with the sewerage scheme. Upon this Mr. Kenealey, drawing upon what the chairman, Mr. H. S. Deacon, described as "a lively imagination," proceeded to harrow the feelings of his fellow members by a series of assertions of a highly sensational description. Seventy pounds was, he said, "a terrible sum to be asked to pay suddenly" for services the details of which had not been given; all the more so as the liabilities of the council at the present time were "tremendous." Then, emphasising the high note of fervid alarmism, he proceeded to quote figures, and concluded by inquiring, fearfully, "where were they going to get the money from?" When all this exaggerated diction was submitted to the test of sanity and candour by the chairman, it appeared that the Sanitary Committee had given the matter "most careful consideration;" that Mr. Inskip had been engaged upon the understanding that his duties would entail two days' work a week; that the surveyor was given extra work to do; that he had drawn plans, arranged easements, attended to maintenance work, flushed chambers, sunk trial holes, and fixed the positions of 700 junctions along the mains; and finally that the surveyor had saved the council a great deal of money. After such an explanation it was, of course, admitted by an overwhelming majority of the council, they being reasonable men, that it was a matter of obligation on their part to recognise, however inadequately, the services rendered by Mr. Inskip. There is really no accounting for how far some people will go when under the influence of a "lively imagination."

Modern Methods of Road Construction.

By [illegible], Engineer and Surveyor to the Leyton Urban District Council.

[illegible] real use all will admit, but unless expressed concisely they lose value, while, unfortunately, in consequence [illegible] ideas are circulated of which it may truly be said [illegible] reasonably upon the subject, and the minds of many [illegible] have been misconceptions.

We know that bituminous roads are replacing [illegible] like to admit it or not, that the initial cost is still the leading factor which governs the introduction of any method into a fresh district. As to the value of the various methods, there is doubtless, as so often stated, room for all; but the surveyor wants to know what are the points that should be considered the dominating factors of each and every method, and doubtless the collection and tabulation of these factors in the order of their respective merit and importance is the main object of your request for contributions to your special issue dealing with the subject.

I therefore venture to suggest two points which, in my opinion, should stand at the head of your [illegible] been advanced by abler and more experienced writers than myself, but which have neither separately nor conjointly received the attention which is their due.

Waterproofness.—What modern method is there [illegible] commencement or has remained so over a period [illegible]

Resiliency.—What method either satisfied this requirement when first laid down, or has retained it satisfactorily in summer and winter, or over a period of two or three years?

If a road is not waterproof, it cannot retain its resiliency; if it is not resilient it cannot retain a smooth and regular surface under present-day traffic. The water-bound macadam road is doomed on these two factors alone.

How wearisome the recent lengthy discussion upon different methods of construction, when all the time we knew they failed in respect of one or both of these requirements! The waterproofing by surface treatment with tar was so marked an advance upon the old, dusty, water-bound road that I am afraid the public Press and some others rather overstepped themselves, and later, when we were presented with the idea of an inch asphalt carpet laid on our old macadam roads, it was in some circles assumed that the Millennium had come; yet in the busy suburban streets of Greater London we find that surface treatment on our heavily trafficked roads disappears with the swallows, and the resilient carpet fails in use over defective patches in the old foundations. Moreover, some methods of construction held to be suitable for light traffic have been found to cost nearly as much as other methods found suitable for heavier traffic, and, of course, much more for maintenance.

The Road Board have given us standard specifications for tar-macadam and pitch-macadam. Does tar-macadam meet the requirements of both the factors I have laid down? If so, for how long will it last—until its nature becomes as brittle as pitch? [illegible] Stone grouted with Trinidad bitumen matrix will meet both requirements, but that is more than can be [illegible] the bitumens that are now being [illegible] Why have we no standard specification for bitumen?

Given proper and reliable materials, the municipal [illegible] best way to make his roads, and no doubt there will be many good ways. The following specification [illegible] reasonable initial cost, suitable for the hard wear and tear of 'bus traffic, and capable of maintenance at from 2d. to 3d. per square yard per annum. Its waterproofness and resiliency have been retained, while endeavouring to stiffen the lower part of the crust to minimise internal attrition and distribute the shocks of vehicular traffic more uniformly over defective portions of the old foundation.

This road also preserves what I am told by many [illegible] a reasonably good foothold for horses.

Specification for 150 yds. Length of Roadway

(1) Scarify and roll the road, and, if very dry, lightly water.

(2) Take 5 tons of granite broken to 1½-in. gauge, 2½ tons granite chippings (½-in. to dust), and twelve bags of Ferromac; mix with a solution of calcium chloride (35 lb. calcium chloride to 50 gallons of water) to form concrete, and spread evenly over foundation.

(3) Spread immediately and evenly over above 9 tons of granite broken to a 2-in. gauge.

(4) Lightly roll and consolidate to surface shape.

(5) Heat [illegible] Trinidad bitumen matrix to 450 deg. to 500 deg. Fahr., and well squeegee over surface.

(6) Cover with ⅜ in. screened granite chippings, and well roll with steam roller.

Cost.

No. of item.		£	s.	d.	Pence per sq. yd.
2	tons 1½-in. gauge at [illegible]	1	0	0	5.60
	tons chippings at 10s. 6d.	1	6	11	2.15
	12 bags Ferromac, at 5s. 6d.	3	6	6	9.28
3	9 tons granite, 2-in. gauge, at 13s.	6	6	0	10.08
5	1 tons Trinidad bitumen matrix, at 65s. 6d.	12	14	0	20.32
6	31 tons chippings, [illegible] at 11s. 6d.		17	3	1.38
	Labour, 9 days, at [illegible]	2	5	0	3.60
	Cartage, coal and [illegible]	1	5	0	2.00
	Rolling		13	0	1.04
		£32	3	2	54.45

A FEW WAR HINTS TO SURVEYORS.

(By a Correspondent.)

See that your roads are free from unrolled metal or loose stones; remember that the soldiers' feet are [illegible] as the rifle.

See that your road direction posts are legible, and if not put up printed ones to serve temporarily; on the march a wrong turning may throw a body of troops out of action.

Be able to advise any officer where the best "halts" can be found on the line of march. These halts should, if possible, be shaded, have grass verges where the men can lie down, and where they can "ease themselves" if necessary. Be able to advise also as to the positions of the best temporary camping grounds in the neighbourhood. These should not be [illegible] water supply, remember that troops on the march suffer terribly from thirst. The surveyor could arrange with the inhabitants of villages through which the soldiers march to line the sides of the road with jugs and cans of water ready to hand to the men as they pass, recovering the vessels as they are emptied. No humane commanding-officer could object to this so long as the ranks were not broken or the men stopped in their marching.

Remember that a very dusty road is a cruel punishment to soldiers on the march, especially to those in the rear of a column. How this can be prevented must be left to the ingenuity of the local surveyor.

Institution of Municipal and County Engineers.

THE CHELTENHAM MEETING: GENERAL ENGINEERING SUBJECTS.

(Conclusion.)

With the matter appended we bring to a close our report of the roads and general engineering sections of the annual meeting of the Institution of Municipal and County Engineers at Cheltenham. We have yet to record the proceedings of the Housing and Town Planning Conference held in connection with the gathering, and the various papers which were presented at the several sittings of the conference will be reproduced as opportunity offers, with reports of the discussion which followed their reading.

APPLIED GEOLOGY IN MUNICIPAL ENGINEERING.

By Herbert Lapworth, D.Sc., M.Inst.C.E.

Few municipal engineers of to-day can fail, after much experience, to realise the importance of practical geology in the construction of their works. The success of underground water supplies, whether attained by knowledge, trial and error, or by a stroke of luck, is admittedly dependent in each case upon the local geology. In works of sewerage, again, the cost may be largely influenced by the nature of the geological materials met with in the trenches and tunnels producing, as they may do, difficulties and expense in excavation, timbering, dealing with ground water, and modification in the design and construction of the permanent work. The same general principles apply to all deep excavations or foundations that may be carried out by the municipal engineer, whether in the construction of new roads with deep cuttings, sea, river and retaining walls, bridges, reservoirs, sewage tanks, or large buildings. The geology of building stones, road metals, and similar materials, though in a lesser degree, is of importance in all those branches of municipal work in which they are constantly employed.

One of the most striking factors that has forced applied geology upon the attention of the engineer has been the number of disputes which have arisen between contractors and municipal authorities concerned almost solely with the "nature of the ground" encountered during construction of public works. A few of these cases have been taken to the courts, some to arbitration, while others have been privately settled. In most instances the cause of the dispute has been due to some misunderstanding as to the "nature of the ground," or, in other words, the geology of the excavations, and almost invariably the ultimate result has been costly.

Frequently this kind of trouble has been the result of providing intending contractors with inadequate or misleading descriptions of the strata obtained from trial holes or borings. Another cause has been the enforcing under the contract of a type of construction unsuited to the kind of ground unexpectedly encountered in the trenches or foundations.

Quite outside the question of legal disputes, however, serious difficulties have arisen, and heavy expense has been incurred by locating works in bad ground, either through lack of previous geological investigations, or by wrong deductions from haphazard exploration, when such troubles might have been avoided in the original location or largely anticipated by investigation with practical geological knowledge.

It is a remarkable fact that this branch of engineering, common as it is to all classes of the profession and on which so much frequently depends, is so strangely ignored in our own engineering literature, and until recently so little considered in the scientific training of civil engineers. Thus, we find in our engineering text-books the most minute mathematical investigations of structures, more or less without relation to the varying geological materials on or in which they may be placed.

As a minor example, retaining walls, the dimensions of which, other things being equal, depend entirely upon the geology, water-bearing nature, and dip of the materials to be supported, are subjected to detailed mathematical analysis which may, in the drawing office, be slavishly applied to practice by arithmetical and graphical calculations, without any knowledge of the ground in which the walls are to be built.

To a limited extent the design of tunnel and sewer sections, for example, in "good" and "bad" ground are considered in text-books, but no account is given of the many types of material met with underground under varying conditions, nor of the principles of the occurrence of underground water, the great variation in cost, and the difficulties of construction under different geological conditions. Under "earthwork" we find the usual tables of slopes, prismoidal formulæ, and the like, but practically nothing on the highly important subject of "slips," or treatment of soft, unstable or "bad" ground.

It may be argued, and rightly, that these are matters of actual practice and experience; but this does not excuse the failure of these treatises to impress the student with the great variation in cost and difficulties of engineering construction in different deposits, and the fact that efficiency and economy in construction might be as much the result of geological knowledge and investigation as of skill and experience in calculation and design. In some degree this void in the engineering text-books is due to the extreme complexity and variation in the physical properties of the geological deposits, which render them incapable of mathematical analysis.

Another inconsistency is sometimes to be seen in the letting of large contracts, where we may have items in the schedule of quantities amounting to only a few shillings, yet the contractor may be wholly ignorant of the character of the ground in which the works are to be constructed, and may, in consequence, under-estimate by several thousand pounds the cost of excavation.

The causes which have contributed to the scant consideration of practical geology among engineers are not easy to determine. Probably the chief of these is the fact that, whatever geological difficulties do arise during construction, it is always possible to complete engineering works, whether economically or not, without geological knowledge, and the engineer is not likely to be blamed by his employers for what turns up unexpectedly below ground.

Secondly, there is a pessimism among certain engineers, some of whom, though they may be experienced in excavation work, have little time for geology, and see only a comparatively heterogeneous mass of deposits underground in no sort of order, and to be classified broadly into two types—"rock" and "muck." There is also the optimist, who expects the geologist, by surface indications alone, to prophesy precisely what will be met with in almost every yard of his proposed trench, and, in consequence, loses faith in the accuracy and practical application of the science.

Thirdly, we have scant consideration of the subject in the engineering and geological text-books. The former have already been discussed; the latter, while containing all the necessary elements for the study of the subject, rarely present the applied or practical side of the science, except on the very broadest lines, and include matter that is unnecessary to learn, and which has rarely any direct bearing upon engineering questions.

In the writer's opinion, every civil engineer should be familiar, first, with the elements of geology—*i.e.*, the principles of stratification, and formation of rocks and deposits, and the various structures occurring in them as the result of formation, change, weathering, or earth movements. He should be able to recognise and describe correctly all the common solid rocks and unconsolidated deposits. He ought also to understand a geological map as he does a working drawing, and be able to plot approximate geological sections from it, as well as accurate geological records from borings, trial holes, trenches and tunnels. A training in petrology is desirable for the road engineer, but expert knowledge in this branch of geology usually requires more time than the professional engineer can afford. A thoroughly practical geological training, however, cannot be acquired without considerable experience in the field.

Of equal importance is the subject of hydro-geology. This includes the principles of the occurrence of

[illegible] engineers, but, so far, the quantitative results have been of little direct application to practice, owing to the [illegible] Nevertheless, the principles arrived at are of great [illegible] pute or prophesy, and to deal more rationally with underground-water problems where a certain amount of local information has already been secured. The value of this science is not only found in questions of water supply, but in the excavation of trenches, cuttings, deep foundations, tunnels, drainage, and the like.

It would be impossible in a paper of this kind to cover the whole of that region in municipal engineering on which practical geology has a direct bearing. The following are merely a few selected instances commonly occurring in practice.

PRELIMINARY GEOLOGICAL INVESTIGATIONS ON IMPORTANT WORKS.

In the majority of important public works it is desirable to ascertain, by means of trial holes or borings, the nature of the ground in which the works are to be constructed. The object of these investigations [illegible] secondly, the ground-water levels; thirdly, whether [illegible] if practicable; and, lastly, to enable contractors to make a fair tender for the cost of construction. As regards the latter, it has given rise to discussion among engineers whether data obtained from trial holes and borings should be shown to tendering contractors, because of the possibility of future claims or litigation. Information of this kind, however, allows a contractor to put in a fairer price, and avoids the necessity of his protecting himself, as he often does, by increased prices for unknown ground. Without such knowledge, a contractor's tender must usually be either unfair to the municipal body or the contractor himself; but there are pitfalls, of course, although the more practical geological knowledge there is brought to bear on the investigation, the less will be the risk.

As regards the selection of sites for borings, &c., it is essential that the number of holes should be sufficient to give reliable information, and the strata must be correctly described. Each hole should be sunk to the full contemplated depth of the excavation, and located on the centre line, or within the limits of, and not outside, the work itself.

An interesting example of the result of sinking trial holes clear of the work occurred recently in this country in connection with a tunnel sewer. The trial holes, in order to save expense, were sunk in a railway cutting parallel to the sewer. These proved the ground to consist entirely of sandstone and conglomerate, whereas at least half the length of the tunnel was found to be in marl, the discrepancy being due to the cross dip of the strata. In the sandstone and conglomerate the tunnel was driven without timber, while in the marls close timbering was required throughout owing to falls from the sides and roof. An action was brought by the contractor against the public authority on the basis that misleading information had been supplied to him.

In the solid rocks the selection of the sites for trial holes, &c., can often be much assisted by a knowledge of the surface geology. This is especially applicable to tunnel work and the like; but the majority of municipal works are founded close to the surface, and the nature of the ground is dependent more on the character and depth of the soils, subsoils, and surface deposits of the districts. As the detailed structure and arrangement of the surface deposits cannot be foretold with any accuracy from surface indications, trial holes or borings are essential.

WATER SUPPLY.

It is, perhaps, in questions of water supply, and especially in schemes from underground sources, that a sound knowledge of geology and hydro-geology is essential. The selection of a site for a well or boring, which will yield a satisfactory amount of pure water, requires intimate acquaintance with the local geology, the order, arrangement and structure and water-bearing characters of its various strata, both as regards its [illegible] rocks and superficial deposits. Familiarity with hydro-geological principles will also assist the investigator in analysing more rationally from data in local wells and springs the existing underground water resources of the district, and in considering questions of possible pollution from farms, fields, cesspits, cemeteries and polluted streams. Similar principles apply largely to water supplies from springs.

Geological considerations are also highly important in the selection of sites for impounding and service reservoirs, dams and embankments, and in the location and construction of lines of aqueduct, pipes and tunnels; but these are matters, perhaps, more usually in the domain of the consultant, dealing with large schemes, than in the routine work of municipal engineers. . . .

LINES OF SEWERS AND PIPES.

In the construction of lines and sewers we find many questions arising where applied geology may be of use in location, design and construction. The most serious difficulties are generally encountered in the unconsolidated deposits of alluvial, glacial, and other recent origin. The beds of clay, silt, mud, running sand and peat, which so frequently occur in these formations, are usually capable of supporting only relatively low pressures, and require great skill and experience in the treatment of cuttings or excavations, being especially liable to slips, and to act as a semi-liquid when their existing stability is disturbed by any excavation within their mass. Occurring, as they do, in the low-lying areas in valley bottoms, estuaries, and mud flats, they are liable to be saturated with ground water, which further reduces their stability, and adds greatly to the difficulties of engineering construction. In addition to the obviously waterlogged ground formed of these deposits in low-lying areas, many lines of pipes and sewers may be constructed in water-bearing rocks, and deposits below the saturation level. The opening out of a deep trench in porous or permeable material below the saturation level has the effect of draining the measures on both sides of the trench, and producing a lowering of the water levels in the vicinity. This may often give rise to claims for damage to local wells and springs. Any trench excavated below river level, in a valley bottom and in permeable strata, will tend to collect a large volume of water, and similarly where the saturation level rises from the valley bottom more or less parallel to the ground surface, a deep trench, although distant from the river, may require heavy pumping during construction. In all permeable surface deposits and permeable strata, such as chalk, sandstone, sands, and heavily fissured rocks, in which trenches are to be excavated, it may be often worth while to determine the underground water-levels in local wells, in order to see whether it is possible to fix the levels of the permanent work above them. Local wells have not infrequently been drained dry during the construction of a deep sewer, and sometimes permanently, so that it has been necessary to deepen them in order to restore their water supplies.

An interesting example of considerations of this sort occurred during the design of the Burton sewerage scheme. Here it was anticipated that a deep-water sewer would affect the yield of the brewers' local wells. Water levels were measured in these wells and borings were made to determine the geological strata. The water levels, when plotted, showed that the proposed deep sewer would be considerably below the saturation level, and that the trench would intercept the water and carry it down the valley. The original scheme was therefore modified, and the sewer raised above the water table through about half the length at the upper or town end.

In considerations of this kind, hydro-geology has shown that the saturation level is subject to seasonal fluctuations; hence it may happen that a trench excavated in dry ground above the saturation level during one part of the year may be flooded during the winter and early spring seasons when the ground water is high.

Heavy pumping and consequent lowering of the saturation level in certain sands, peat bogs, and marshes, may also seriously affect the foundations of adjacent buildings, producing cracks and settlement. Cases are on record where the saturation level has been lowered several feet by pumping, and accompanied at a distance of 200 ft. by a settlement in the buildings of several inches.

In hilly districts, such as parts of Yorkshire and

South Wales, for example, sewers and lines of pipes may require to be constructed in steep sidelong ground and across slopes. Here there is a strong tendency for the surface material to slip into the trench, and great pressures may be brought to bear upon the timbering, and even upon the permanent work, which may be forced downhill and fracture. Such catastrophies have occurred with lines of earthenware pipes and brick culverts in this country.

In certain types of ground, again, such as those formed of steeply dipping shales or clay masses, or surface materials upon a highly inclined rock surface, slips are liable to occur, and even the permanent work may require to be strengthened.

Another common phenomenon is occasionally forced on deep trenches wholly in clay deposits, which may appear to be perfectly consolidated and firm during excavation. The weight of the material on both sides of the trench may be sufficient to cause the plastic material to flow, with the result that the timbering must be crushed in and collapse, accompanied by an upheaval of the bottom of the trench and of the permanent work. The writer has known of a length of over 100 yds. of culvert invert and side walls destroyed in this way. In some of the glacial clay deposits of Lancashire the trench bottoms have been observed to rise between the operations of trimming the trench bottom and bedding the pipes.

In ground of soft clays, mud, silt, running sand or peat, the difficulties of construction are, of course, at their worst. Special precautions must then be taken from the outset in timbering, strengthening the section of the permanent work, draining, and so dealing with the foundations below formation level as to enable the ground to support the weight of the overlying structure.

Finally, we have those subsiding areas in this country due to coal mining or brine pumping, where lines of water main and sewers, and especially the latter, are liable to be constant sources of trouble due to unequal settlement of the permanent work. In most instances of this kind the subsiding areas must necessarily be traversed by these lines of works; but it may sometimes be possible to avoid both the affected areas and those liable to future subsidence. Again, problems of surface protection and purchase of the underground minerals may occasionally arise. The subject is too vast, however, to discuss here, but it may be taken for granted that in questions of this kind the engineer armed with a sound knowledge of the local underground geology and its relation to the subsiding surface is likely to be more efficient not only in dealing with lines of pipes and sewers, but with reservoirs, filters, bacteria beds, and other works.

SITES FOR SEWAGE IRRIGATION FARMS, CEMETERIES, ETC.

In the selection of sites for sewage irrigation areas, the nature of the underlying subsoil is one of the most important factors. Usually extensive stretches of porous or permeable material, such as gravels and sands, prove the most satisfactory land for this purpose. The ground water levels and the direction of underground flow in relation to the nearest stream or river, and the possibility of pollution of local wells and springs should all be investigated. Hence, practical geology and hydro-geology are here both of direct application. Where bacteria beds are in use, and the effluent is comparatively harmless, these conditions, of course, are not so important.

In the location of cemeteries, again, similar investigation is essential. A suitable subsoil, easy to excavate, and capable of standing without support for a short time, is desirable. The maximum height of the ground water should be below the level of the bottom of the graves, and the direction of its flow, where there is any question as to pollution of local wells and springs, should be ascertained, either by actual measurement or by inference from the local geology.

ROADS AND ROAD METALS.

In the construction of new roads in the colonies or other foreign countries, practical geology may be a very important factor in location, where the choice of a route may be guided by the geology of the district to be traversed. Thus, areas liable to slips, or formed of very soft or very hard material, or requiring heavy retaining walls, may sometimes be avoided by deviation. In this country, however, the routes of the few new roads that are now being, or likely to be, constructed, are more or less fixed within rigid limits. Still, even here practical geology and hydro-geology, when combined with engineering experience, are valuable aids in the excavation and drainage both of the cuttings and the road-bed itself.

As regards the materials for road metals, a sound knowledge of the occurrence and petrology of road stones is decidedly useful. The early experimental and scientific work of Lovegrove, Howe and Flett in this country, and others abroad, was a promising beginning in the scientific study of road metals. The introduction of tar and bituminous compounds, the tests of different materials in actual use on the road, at Stockton, and the formation of the Road Board marked further stages. But road engineers are still finding difficulty in arriving at standards of value in road materials, and much practical and scientific work seems still to be necessary, both from the engineering and geological aspects. The modern road must necessarily be a complicated study, containing as it does problems in physics, chemistry, and geology. Perhaps with the establishment, in time, of courses in highway engineering at the universities, so strongly urged recently by Mr. H. P. Boulnois, we may stimulate scientific research in this direction, and, in conjunction with the practical results and experiments of road engineers, evolve a new technology, for which there seems to be a considerable need.

DISCUSSION OF DR. LAPWORTH'S PAPER.

Mr. S. S. Platt (Rochdale) proposed a vote of thanks to Dr. Lapworth. As some of them knew, he (the speaker) had taken a great deal of interest in this branch of their work, and had, perhaps, a little longer experience than Dr. Lapworth, and to that extent had realised quite as much as he had the necessity for engineering training to include a considerable knowledge of applied geology. In Vol. 35 of their "Proceedings" there was a very excellent paper by Mr. Julian, and he spoke on it then. This was a more amplified paper, and one of the best papers he had ever come across. It embodied practically all that could be said on the subject. In an address which he gave some years ago he said: "I do not mean to say that he should necessarily be an expert in these kindred subjects, but he should be sufficiently well grounded and acquainted with them as to be able to deal with ordinary developments, to interpret properly and apply the work of specialists in this branch, and to appreciate fully the relation of these subjects to the engineering work he has in hand or in contemplation." If there was one thing more than another, in addition to excavations, it was with regard to the study of stones for road construction. They had the attrition tests, and so on, but the engineer could do a great deal for himself. He could tell very soon whether any stone was likely to suit his purpose. In foundations, tunnels, drainage, and so on, it was necessary that he should know what to expect and what to look for. He did not propose to enlarge upon it, but only to ask the members to read this paper very carefully. It was written in a splendid manner, and if they would only saturate themselves with the spirit of it, they would be a good deal wiser; it would lead them further in the study of geology, and they would benefit considerably. He had very great pleasure in moving a hearty vote of thanks to Dr. Lapworth.

Mr. F. C. Uren (Aldershot), in a communication read by the secretary, said the importance of a knowledge of geology could not be over-estimated either to the consulting or municipal engineer. This view was emphasised in the curriculum obtaining in all engineering colleges, both at home and abroad, where geology and mineralogy formed an integral part of the education of the engineering student.

Mr. Platt said that in all his works he insisted upon all his assistants recording information as to the strata passed through in all trenches and excavations, and the information obtained was exceedingly valuable, and would be useful in the future, except in places where the ground changed very rapidly and the changes could not be foreseen.

The Chairman (Mr. T. W. A. Hayward) said that they felt greatly indebted to Prof. Lapworth for writing this paper. He quite agreed with everything Mr. Platt had said with respect to this paper. It was a paper which would be of great service to them hereafter as a work of reference.

Dr. Lapworth thanked those present for the reception of the paper. The paper did not attempt to set out difficulties which arose in work, but tried to show

THE WAR: PRESIDENT'S CIRCULAR TO MEMBERS.

[illegible] assistance which might be given by members of the [illegible] suggested would be gladly taken advantage of in case of emergency. A grave crisis having arisen, the following [illegible] within the power of our members to render:—

"(1) To be prepared to point out suitable camping grounds and temporary halting-places having regard to water supply and sewage disposal, and for this purpose to co-operate with the water engineer of the district. It is suggested that suitable places should be indicated on a map in readiness.

"(2) To be prepared to improvise water supplies, and to carry out sanitary measures in connection with camps, &c.

"(3) To facilitate transport by having all main roads free from obstacles, and any weak bridges made safe for heavy traffic.

"(4) To be prepared to guard against possible interference with the supply of water, electricity, &c., by spies.

"(5) To be prepared with suitable employment in case of distress, particularly bearing in mind that labour, and not material, should form the chief part of the work.

"(6) To offer services gratuitously to adjoining districts from which a colleague has gone to the front.

"(7) To urge upon employees the duty of acquiring a knowledge of ambulance work, and to give every facility and encouragement to them for so doing.

"No doubt these and other matters in which the local knowledge of members of the institution may possibly be useful to the military authorities have been already considered, but the foregoing suggestions are made with a view to ensuring the ready co-operation of our members."

Exeter City Surveyor and Road Making.—Mr. T. Moulding, the city surveyor of Exeter, has announced that he is about to report to his Streets Committee on the whole question of road making, including tar-spraying.

The Civic Engineer's Who's Who, compiled by the editor of THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER, for a second annual issue is remarkably complete. The biographical matter is full and methodically arranged. The book is published by the St. Bride's Press, Limited.—*Liverpool Courier.*

Canadian Road Enterprise.—Nowhere throughout Canada has the matter of road improvement taken greater hold of any town than at Belleville, in Ontario. Owing to the enterprise of Belleville several past-presidents of its Board of Trade, accompanied by an engineer, have been in England inquiring into the merits of various road-surfacing materials and inspecting roads. This party has been under the guidance of Mr. John Elliott, a well-known resident in Ontario, president of the Board of Trade of Belleville and manager of the Standard Bank of Canada there.

Southgate's Housing Scheme.—Mr. C. G. Lawson, surveyor to the Southgate Urban District Council, explained at an inquiry recently that the proposed housing scheme of the council provided for 160 houses, comprising seventeen to be let at 8s. a week inclusive, eighty-four at 7s., fourteen at 7s. 6d., thirty-one at 5s. 6d., and fourteen tenements (divided into twenty-eight flats) at 4s. a week each. All the houses would be equipped with cupboards, baths, and every up-to-date sanitary and other convenience. The roads on the estate would be 40 ft. wide, the distance between the buildings being 80 ft.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

What can the civilian do, individually or collectively, to assist the country in this the greatest crisis that has occurred since the days of Napoleon?

* * * *

What can the local surveyor do in order to assist the Government and the War Office in the mobilisation and movement of the troops, armaments and stores?

* * * *

What can the [illegible] and their officers do, by way of preparation, for the provision of temporary hospitals, medical staff, and nurses if the occasion should unfortunately arise when they are suddenly required?

* * * *

What can be done towards assisting in the necessary protection of our water supplies, machinery, gas-works, and other necessary adjuncts of our daily life?

* * * *

What can be done to make provision to stem any outbreak of enteric or other diseases which seem inseparable from war?

* * * *

What can be done to prevent, so far as is possible, any waste of food, petrol, or other commodities which may, at no far-off date, become scarce?

* * * *

What can be done to assist in the provision for billeting the troops of our country if and when the necessity arises?

* * * *

What can be done to keep as many men as possible employed on municipal works, so as not to swell the ranks of the unemployed?

* * * *

What can be done to prepare for the danger of conflagrations on a large scale? Could not the fire brigades be temporarily strengthened by volunteers, who should be at once trained in their duties?

* * * *

Cannot these suggestions, and many more, be well considered and put in practice at the present moment, so that we should not be altogether unprepared in the case of any eventuality occurring?

* * * *

Will not all road makers be glad to learn that Mr. Herbert Samuel has promised a committee to investigate the present regulations of the Local Government Board with regard to weights of vehicles, widths of tyres, and similar matters? Are there not many other questions, such as speed limits, damage caused by motor omnibuses, grants in aid, which could be usefully investigated by such a committee?

* * * *

Do many of us realise the almost staggering figures that can be deduced, by a little calculation, of the cost of four roads, on reading the fourth annual report of the Road Board? Do we not find that the cost of the "improvement of the crusts" of about 368 miles of county main roads has been about £690,000? Do we not also find that there are 27,879 miles of county main roads in England and Wales, and that, consequently, to treat only one half of these roads in a similar manner would cost about 26 millions of money? Does the "man in the street" realise this when he talks so glibly of "the bad state of our roads"?

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangements well suited for easy reference.—*The Law Times.*

* A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities. By S. G. Turner, of the Middle Temple, Barrister-at-Law, A.M.I.C.E., &c. London: St. Bride's Press, Limited. Price 10s. 6d.

MERSEY AND IRWELL JOINT COMMITTEE.

CHIEF INSPECTOR'S REPORT.

Mr. Hugh Stowell, M.INST.C.E., chief inspector to the Mersey and Irwell Joint Committee, has issued a report dealing with the work of that authority during the past two years.

Contributing slow progress has been made as regards progress towards efficiency of sewage works belonging to county boroughs in the area within the jurisdiction of the committee. Bolton have not yet been able to commence their large extensions owing to the renewal of coal working under the site of the works. At Manchester a new scheme of extensions has been approved for the Davyhulme works, and good progress has been made with the new main sewerage scheme. Under this scheme the sewage of the inefficient Moss Side sewage works has already been diverted to Davyhulme, a portion of the Gorton sewage has already been, and the remainder should shortly be diverted to Davyhulme. At the Withington sewage works of the Manchester Corporation a tank on the Imhoff system, believed to be the first installation of its kind in the country—has been constructed, and will shortly be in operation.* At Oldham the remainder of the percolating filters have been completed and are in operation. At Rochdale the first instalment of the large extension has been completed and is in operation. The second instalment of additional percolating filters, in accordance with an undertaking given to the Local Government Board, should be commenced by May, 1915. The Salford Corporation have given an undertaking to complete all the works recommended by their consulting engineer, except the additional area of filters, by September, 1915, and the additional filters by September, 1916. At present only the renewal of the existing filters is in progress. Stockport have had a large scheme of extensions approved by the Local Government Board, but it is at present in abeyance pending negotiations with Manchester for the interception and treatment of the Stockport sewage. The urban district of Heaton Norris has been amalgamated with Stockport, and the sewage will be taken to the Stockport sewage works.

Among the non-county boroughs, Ashton-under-Lyne have submitted a scheme of extension to the Local Government Board, Macclesfield have extensions under consideration, and Middleton have entered into an agreement with the Manchester Corporation for the reception of their sewage into the city sewers for treatment at the Davyhulme sewage works. The large extensions at the sewage works of the Leigh and Atherton Joint Sewerage Board have been completed, and are in operation. Very slow progress has been made with the extensions at the sewage works of the Stalybridge and Dukinfield Joint Sewerage Board, but new arrangements are being made which will, it is hoped, expedite completion.

Among urban districts, schemes are under consideration for Altrincham and Irlam. A new sewage works has been completed, and is in operation, for the Heatley district of Lymm. The extensions at Crompton (New Hey), Swinton and Whitefield have been completed. Extensions are in progress at Denton, Ramsbottom, and at the works of the Urmston and Flixton Joint Drainage Committee. Good progress is being made with the new sewers and sewage disposal works for the Springhead Urban District, and also with those of the Whaley Bridge and District Joint Sewerage Board. Schemes for extension have been approved by the Local Government Board at Tottington and Tyldesley, and will shortly be commenced. Schemes have been submitted to the Local Government Board for extensions to the sewage works at Hale, Turton (Eagley), and Westhoughton (Rogers' Farm). Extensions to the filters have been constructed at Kearsley, Littleborough, Little Hulton (Ellenbrook), and Radcliffe.

At several other works minor extensions have been carried out.

Among the rural districts, new sewage works have been completed for Outwood and Ringley, in the Bury Rural District, and at Tintwistle. Schemes have been submitted to the Local Government Board for extensions at Coppice Clough (Barton Rural District), Northenden (Bucklow Rural District), Prestolee (Bury Rural District) and Disley.

During 1912-13, 5,694 inspections have been made at sewage works and 952 samples taken, of which 381 were classed as bad or polluting, and 571 were passed. "Progress towards efficient purification should not be judged by these figures. Mr. Stowell points out "that a large number of samples are always taken from works which are known to be inefficient; for instance, of the 381 samples condemned, over one-third came from three sewage works belonging to county boroughs."

No radical alteration in methods of sewage purification has been adopted in the last two years, but a considerable amount of investigation has been devoted to methods of sludge disposal with a view either to a reduction of bulk and offensiveness, or to the recovery and utilisation of manurial constituents. "The sludge problem has often," Mr. Stowell observes, "been described as the crux of the question of sewage disposal and this problem tends to increase rather than decrease in importance with modern methods of sewage disposal, as the higher efficiency aimed at has resulted in an increased bulk of sludge to be dealt with." The provision of storm tanks and humus tanks has been amply justified by the amounts of sludge retained. At one sewage works, with a dry-weather flow of 1,500,000 gallons, in two months 1,150 tons of wet sludge were taken from the storm tanks, resulting in 311 tons of pressed cake. The storm sludge mixed with ordinary sludge pressed well, requiring only 5·44 per cent of lime against 7·25 per cent required for ordinary sludge. No extra time was necessary to press this extra quantity, and it is stated that no extra cost was involved.

"In a previous report," Mr. Stowell recalls, "I referred to the necessity for the provision of gauging appliances at sewage works to enable accurate information to be obtained of the amount of sewage dealt with, and for the proper separation of sewage proper and storm flow. Without such information, satisfactory control of the works and the accurate fixing of the levels of overflow sills is difficult, and controversy is often raised over the relative proportions dealt with as sewage and storm water. In a few cases such appliances have been provided, but their more general adoption is very desirable, and it would be of great assistance if the Local Government Board insisted on their provision before sanctioning sewage disposal schemes of any considerable size."

* An illustrated description of this appeared in THE SURVEYOR of May 29th last.

SANITATION AND WAR.

On Tuesday afternoon last about eighty officers and men of the 2nd London Sanitary Corps, under the command of Major Goddard, visited the Royal Sanitary Institute in Buckingham Palace-road. They were welcomed, on behalf of the council of the institute, by Mr. H. Percy Boulnois, M.INST.C.E., vice-chairman of the council, who, after speaking of the patriotic work in which the corps were engaged, proceeded to give a short lecture on sanitary subjects, illustrated by lantern slides.

On the conclusion of this lecture, Mr. W. C. Tyndale, M.INST.C.E., the sanitary adviser of the War Office, gave an address of an interesting and practical character on the sanitary requirements of the barrack and the camp.

Subsequently the men proceeded to inspect the sanitary appliances and other exhibits in the Parkes Museum, which forms part of the Royal Sanitary Institute premises, the various objects being explained by members of the council who were present.

The example of the Royal Sanitary Institute is one which might well be followed by other institutions or societies while the men are waiting for active service.

Coast Sand Dunes, Sand Spits and Sand Wastes (By G. O. Case. St. Bride's Press, Limited, 24 Bride-lane, E.C. Price 5s. nett.).—The object of this book, as stated by the author in the preface, is to direct attention to the advantage of controlling the blown sand dunes on the sea-coast so as to make them act as a protection to the land behind from erosion by the sea, to prevent them from advancing inland and destroying existing vegetation, and to enable sand wastes, where they exist, to be reclaimed and planted with trees. . . . The information on the subject dealt with is, however, given in a handy form, and will be found useful and instructive to those interested in coast geology or having charge of land bordering on the sea shore.—*Nature.*

Law Notes.

Edited by B. REIGNIER CONDER, 11, Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

To help us to answer any questions affecting the practice of engineers and surveyors in municipal work, readers should write briefly and precisely, stating the facts of each case in addition to a plan if necessary, at the office of The Surveyor, addressed to the Editor, and marked "Queries." Correspondents' names are not published, but their names and address, and correspondents are do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in BLACK INK ONLY, and in such style as to be fit for direct reproduction (i.e., without re-drawing or amendment). Unless these conditions are complied with we cannot undertake to reply to queries.

QUERIES AND REPLIES.

In order to avoid [illegible] queries are requested to use distinctive names as a plan de plume. The letter X, [illegible] "A. X. Y. Z." and local such as "engineer" and "surveyor" [illegible]

[illegible] Accident.—"Anxious" writes: What is the position of an [illegible] who is [illegible] with an accident while engaged in the performance of his [illegible] and who is [illegible] thereby incapacitates him for [illegible] the local authority does not charge [illegible] his wages, and who, by the assistance of members of his family, arranges to keep the duties [illegible] to the council. The actual duties performed at the time of the accident was emergency [illegible] outside of ordinary office hours the accident happened at 9.15 p.m. The local authority [illegible] the injured official's annual [illegible] from the Government Compensation Act, and [illegible] the insurance company in respect of the accident. The [illegible] has not practically recovered, but he has a large scar on the face as the result of the injury, which will be a permanent disfigurement or else. (1) On what basis should compensation be settled? (2) Is the injured person entitled to compensation for the permanent facial disfigurement apart from the incapacity from duty? (3) On settlement of the amount with the insurance company, are the local authority entitled to hold the money, as they have paid full salary during incapacity, although they have not relieved the official from any of his duties, nor paid anything extra to have the work of his office carried out?

(1) Assuming that the [illegible] is a workman within the meaning of the Workmen's Compensation Act, 1906, and that the accident arose out of and in the course of the employment, and that [illegible] of partial incapacity for work [illegible] from the injury, he would be entitled to a weekly payment during [illegible] not exceeding 50 per cent. of his average weekly earnings during the previous twelve months, or [illegible] of his employment, such weekly payment [illegible] but if the incapacity lasted less [illegible] weeks, no compensation would be payable in respect of the first week. (2) No. (3) Assuming that the [illegible] party is in the usual form, the company are [illegible] to pay to the local authority the amount which the latter are liable to pay the official. The local authority are entitled to retain the amount received from the company.

Private Street Works: Public Footpath.—"Chas. Smith" writes: A road [illegible] consists of a [illegible] on the opposite frontages [illegible] making up a private road, [illegible] and [illegible] from road [illegible] have been [illegible] with urban powers under the Private Street Works Act, 1892, for the purpose [illegible] that a portion [illegible] especially [illegible] by the [illegible] [illegible] [illegible]

Royal Sanitary Institute Congress at Blackpool.

TOWN PLANNING AND INDUSTRIAL TOWNS.

By F. W. Platt.

[illegible]

Under what conditions can town planning be most successfully applied? A brief classification of our towns might be made under the following heads: (1) Towns old and standing, partly industrial (2) largest towns, industrial and commercial. (3) Municipal and county boroughs, more industrial than commercial. (4) Municipal boroughs and urban districts, entirely industrial.

In the first three in this list the problems to be solved are more similar in character than in the fourth. The fourth class is probably an example of a modern industrial town. Doubtless it had developed in a sporadic way. Originally it was a group of villages dotted upon the country side, all connected with one another by roads more or less narrow. The inhabitants depended for their existence upon their skill in a particular industry. As the industry increased in volume buildings were erected alongside the roads connecting the various villages. No ordered plan of development was prepared. A community of interest however existed, which, actuated with motives of self-preservation, made application for a charter of incorporation, and thus a town was formed. . . . .

Yet such towns present better opportunities of improving their conditions at less financial cost than do the larger towns. Their geographical position in relation to the undeveloped areas is an advantage in the future planning of the town, and it is rare to find in a town formed as here described that the density of population is great over a considerable portion of its area.

Let it be remembered that a town planning scheme may be made in respect of: (1) Land in course of development, or likely to be used for building purposes; (2) land so situated, in respect of land likely to be used for building purposes, &c., that it ought to be included in a town planning scheme made in respect of such before-mentioned land—*i.e.*, land already built upon, but adjoining vacant land; (3) land upon which it is necessary to carry out works to complete a scheme made in respect of lands of which [illegible] 1 and 2 form parts, and that the general objects of town planning schemes are to provide proper sanitary conditions, amenity, and convenience in the laying out of lands.

Before any town planning scheme may become operative it must receive the approval of the Local Government Board. The first step towards obtaining this is to prepare a *primâ facie* case that a need to town plan exists. Thus the scheme has its origin, and its details must be prepared with due regard to the principles set out above.

A large scale map of the district as now existing should first be examined and afterwards compared with old maps. The sequence of the growth of the town can be followed by these means, and the situation of the vacant land disclosed. An opinion based upon the foregoing examination should be formed whether such land is "land," &c., within the meaning of Conditions 1, 2 or 3 above. When forming this opinion it is important to note that it is the situation and not the size of each plot which is the governing feature. An acquaintance with sec. 54 (7), Housing and Town Planning Act, will also be of much assistance at this stage. Should it be found that the bulk comes under Condition 1—namely, "land in course of development," &c.—it ought not to be difficult to prove that the land adjoining it should be dealt with under Condition 2. Condition 3 is a necessary complement of the preceding conditions.

All that remains, then, is to show that the "general objects" of a town planning scheme are fulfilled, and (subject to certain procedure rules being followed) the *primâ facie* case is made. In the meantime some of the land and buildings may have been dealt with under Part I. of the Housing and Town Planning Act, 1909; for example, closing and demolition orders may have been issued.

The prospective as well as the immediate value of a town planning scheme becomes more apparent during the actual preparation of the town plan. Ideals are translated into fact and find expression in the joining up of the various parts of the district with a chain of roads. By these means light, air, and the prevailing winds are admitted into the more densely developed areas, through which the links pass. The plan should also make provision for the redevelopment of those areas already cleared or closed under demolition orders.

The making of the roads through these areas would cause an increase in value to arise in the land adjoining such roads; and the improved traffic facilities to the land would render it more suitable for industrial or commercial purposes. One-half of the value attributable to these causes would be claimed by the local authority, and applied by them to meet the cost of demolition in other places. . . .

Small industrial towns do not, as a rule, possess many open spaces in their centres. Instances are frequent where circumstances such as contours have rendered it essential for a larger number of houses or other buildings to be erected upon a given area of land than is now thought desirable. Where such exist the provision of an open space in close proximity to a crowded area has a balancing influence. The principle of betterment, recognised by the Act, could then be applied to the adjoining buildings, and the property being improved, the district would be healthier and another amenity added to the town. . . .

The problem of the industrial town does not end when the dense areas have been opened out by arterial roads. The standard of limitation of the number of houses to the acre must receive attention. A minimum "population density" is of the essence of this subject. . . . The actual number of houses depends upon situation and the connection of the area with other dwellings. Fifteen has been considered a reasonable maximum for industrial centres, and whether the "land unit" to which it applies be one or more acres, provision should be made that under no circumstances would it be possible to crowd a large proportion of the houses on one part of the unit, and leave the remaining land open for other prospective use.

The economic aspect of town planning requires but little comment. Every local authority has experience of the cost of street widenings. It is also spending annually enormous sums in sanitary administration to combat the effects of bad housing in industrial centres. Less ascertainable, but none the less real, is the loss to the nation from sickness, ill-health, and premature death.

Mr. J. S. Brown (Blackpool) said that Mr. Platt seemed to think that a good deal could be done in the way of town planning under the by-laws, but most of them would be familiar with the fact that many of them were driven to go to Parliament with private Bills because the Local Government Board were so very timid in granting the local authorities any strong by-laws. The Local Government Board were very timid of going beyond the general law. He hoped that the board, through the Departmental Committee, would proceed to show a little more backbone in regard to entrusting local authorities with stronger by-laws in respect of building operations.

Mr. G. W. Lacey (Oswestry) pointed out that there were many small towns where the growth was comparatively small, and where the preparation of a town planning scheme was almost entirely out of the question.

Mr. C. J. Jenkin (Finchley) said his local authority went to the Local Government Board for by-laws for their No. 1 scheme, and said they wanted certain waiving and modifications of by-laws, and they were told by the Local Government Board that they did not think those by-laws should be special for any one town planned area. They were told that if they altered their by-laws at all they should apply to the whole of the district because otherwise they would be

done.

Mr. E. Wilkins Corbett [illegible] which could be obtained under the Town Planning [illegible] local owners could fix the building lines in all future [illegible]

Mr. Munce (Belfast) asked why the council of the institute did not appoint a small committee to draw up model by-laws. With regard to the width of the streets in Belfast, they had taken the original routes and had set down lines for widening them, and they were doing this widening bit by bit. They did not ask the Local Government Board, but when a man wanted to make an alteration to his property they made him conform to their line.

CORRESPONDENCE.

Sir, though I would persuade, I'll not constrain;
Each man's opinion freely is his own
Concerning anything, or anybody.

—Massinger: "The Fatal Dowry," Act ii., 2.

REMOVAL OF IRON FROM WATER.

To the Editor of The Surveyor.

Sir,—Your editorial on page 150 of The Surveyor of July 31st on "The Removal of Iron from Water" without the use of chemicals has interested me very much.

Your readers may like to know that for many years past a large number of installations have been laid down in this country for removing iron from public and private water supplies by direct oxidation in special Candy filters without employing chemicals. In the Candy compound mechanical filter the difficulties you mention as having been experienced with the American filters are entirely overcome.

You state that after six weeks use the sand grains in the American filter become so badly coated (with the iron) that the ordinary washing arrangements, including compressed air, were found to be inadequate, with the result that the sand had to be taken out of the filter, washed by being pumped through a centrifugal pump, and then replaced.

The mechanical [illegible] for stirring and washing the sand in the beds has, your article states, been found to be effective, and you express the opinion that "it is remarkable that, for such a purpose as this, the fixed spray or rotary sprinkler, similar to those used for sewage filters, is not applied more frequently."

It is, we think, an interesting fact that the method of cleansing the sand in the Candy mechanical filter combines both the fire hose and the rotary sprinkler principle, the sand being cleaned by a continuous row of powerful jets of water issuing, under pressure, from an arm which, during washing, is rotated just above the level of the sand. The jets of water, which are discharged at a velocity of from 40 ft. to 50 ft. per second, penetrate the whole depth of the loosened sand, dashing and rubbing the grains violently one against the other. The water from the jets then combines with the usual upward flow that takes place at the same time, and the united water rises up through the sand, rapidly carrying away the suspended matter—iron or other impurities—that have been freed by the intensive scouring action produced.

I think you will agree that the Candy cleansing system is an ideal one, and far in advance of the American method referred to, and I trust that you will be kind enough to give it, in your columns, the same publicity that has been accorded the American system. We find that we have nothing to learn in the way of mechanical filtration from America, and contend that the mechanical filters manufactured in this country are in many ways in advance of the American practice.

We should like to mention that we have recently supplied installations of the special Candy mechanical filters to the Cromer Council and the [illegible] Water Board, and are just completing an installation for the Staffordshire Potteries Waterworks Company. Yours, &c.,

Frank Candy,
Managing Director,
Candy Filter Company, Limited.

5 Westminster Palace-gardens, S.W.

THE WAR.

To the Editor of The Surveyor.

Sir,—I trust that, during this crisis through which our beloved country is passing, your columns will be kept open for anyone who has anything useful or practical to suggest, so that we who are forced, from various causes, to remain spectators may each add our mite to assist, or at all events not to retard, the great issues at stake. May I therefore give you a few sugestions as to what I consider to be the citizen's duty in time of war?

(1) Whatever his politics may be, he should be loyal to the party in power if they are patriotic.

(2) He should keep calm; there is nothing to be gained from panic, nor, on the other hand, by shouting "Rule Britannia," which should be reserved for the time of victory.

(3) He should scrupulously prevent all waste of food, and should not selfishly store large quantities of provisions. If there is a limited supply of food, he should remember that every article withdrawn from the general supply leaves less for others.

(4) He should ascertain if there is anything he can give or lend to the Government in order to assist his country.

(5) If the necessity arises, he should at once be sworn in as a special constable.

(6) He should remember that it is each unit that makes a mass, and that every individual citizen can do something to strengthen that mass.

(7) Beyond all he should practise unselfishness.

Yours, &c.,

H. P. B.

August 8, 1914.

To the Editor of The Surveyor.

Sir,—Every patriotic citizen who is too old to join the Forces, or is unable to do so for various good reasons, is asking what can I do to assist my country in this great crisis?

It appears to me that there are several ways in which each one of us can do something, if not heroic at all events useful.

(1) We can more scrupulously obey the law so as to cause as little trouble as possible to the police.

(2) We can each one of us be a little more unselfish, and help each other in every possible manner. We can pocket our selfish grievances for a time, and suspend all unnecessary quarrels.

(3) Even litigants can suspend hostilities, and give opportunities for those who would be preparing their selfish quarrels to attend to their more patriotic duties.

(4) We can set an example of temperance. It is the one blot on our boasted patriotism that our public houses should be daily and nightly filled to overflowing with the so-called working classes who are spending their money freely in drink—money which may, ere long, be urgently wanted to prevent them and their families from starving.

Cannot we each one induce these men to realise that money thus wasted in drink is helping the enemy?—Yours, &c.,

Civilian.

August 11, 1914.

To the Editor of The Surveyor.

Sir,—It is a rather curious coincidence, and may be of interest to your readers to hear that on the page of my diary for Wednesday, August 5th, the day that war was declared, the following quotation from Southey appears:—

Order is the sanity of the mind, the health of the body, the peace of the city, the security of the State.

Can we not all take this lesson to heart at the present moment and by so "ordering" our minds

The Surveyor
And Municipal and County Engineer.

become useful to the State, and add to its "security"?

Yours, &c.,

M.INST.C.E.

August 11, 1914.

To the Editor of THE SURVEYOR.

SIR,—"H. P. B." raises, in your last issue, considerations of the very first importance. Undoubtedly the municipal engineer can render national service in the directions your correspondent indicates, and I would suggest that the Institution of Municipal and County Engineers at once get into touch with the military authorities, and in conference settle the lines upon which municipal, civil and military engineers should co-operate.

Yours, &c.,

BOGNORIAN.

August 12, 1914.

To the Editor of THE SURVEYOR.

SIR,—I have read with interest the letter from "H. P. B." which appeared in your last issue, and I beg to inform you that the matter he treats of has for some considerable time been under the consideration of the Institution of Municipal Engineers, and that representations upon it have already been made to the Secretary of the War Office.

Yours, &c.,

B. WYAND,
Secretary.

39 Victoria-street, S.W.

COLE TESTIMONIAL FUND.

To the Editor of THE SURVEYOR.

SIR,—Owing to an unfortunate clerical omission of a paragraph from the circular letter, the appeal in connection with the above gave an impression that contributions were to be limited to 1s., whereas (as explained in a subsequent circular) the intention was to ask for contributions of 1s. to 5s. It was anticipated that the bulk of the members would prefer to subscribe 5s. each, but the lower figure was suggested in order to give every member an opportunity of contributing something, however small in amount. May I ask members who have not already subscribed kindly to do so as soon as possible, and those who have forwarded 1s. under the impression that this was the limit suggested to supplement it by a further contribution should they so desire? If an acknowledgment is required, a stamped addressed envelope should be enclosed with the subscription. I earnestly hope that every member of the institution will show his appreciation of [illegible] and [illegible] of our late secretary by sending a contribution to the fund.

Yours, &c.,

J. S. PICKERING,
President, Institution of Municipal and County Engineers.

Municipal Offices,
Cheltenham.
August 6, 1914.

GOVERNMENT WORK.

NO SUSPENSION OF OPERATIONS.
(OFFICIAL.)

It appears from various inquiries addressed to the Commissioners of Works that there exists some apprehension lest unemployment should be increased in the building and other trades by suspension during the present crisis of building and engineering operations provided for in the estimates of the Office of Works recently approved by Parliament. It is therefore desirable to state publicly at once that it is the intention of the Commissioners of Works to proceed with all services in their charge, to employ as many men as possible to carry out such services, and to develop and expedite their building programme in any way practicable.

As the Minister mainly responsible for Government building, the First Commissioner of Works would wish to take this opportunity of expressing his sincere hope that private individuals, companies, firms, and contractors will spare no effort to follow the policy of the Government in this matter, so far as circumstances admit.

RECLAMATION AND AFFORESTATION.

The Development Commissioners desire to suggest to landowners in England and Wales that they should at once forward to the Agricultural College for their province particulars of any waste land which they are willing to place at the disposal of suitable authorities for improvement by such means as reclamation or afforestation. The particulars of the land should include situation, approximate area, elevation, character of the soil, and the terms on which the land can be obtained by an authority willing to improve it.

LABOUR EXCHANGES AND HARVEST.

The Board of Trade Central Office for Labour Exchanges are making special arrangements for the supply of the farm hands and others required in connection with the harvesting season. All farmers and other employers who are desirous of engaging this class of labour should communicate their wants to the manager of the nearest Labour Exchange, the address of which can be obtained from the local post office. It should be remembered that no fees are charged, either to employers or employees.

Royal Sanitary Institute: Meeting Postponed.—The projected meeting of the Royal Sanitary Institute at Shrewsbury on October 9th and 10th has, we understand, been indefinitely postponed.

Sheffield Hospital Extensions.—The Local Government Board have sanctioned the borrowing of £6,500 required for the proposed extension of the Lodge Moor Hospitals, Sheffield, for infectious diseases. The work is to be commenced at once.

Roadman's Compensation Claim.—The case of a road sweeper who sued the Twickenham Urban District Council for compensation in respect of an accident while in their employment was decided by the Brentford County Court judge last week. The applicant was injured while road sweeping by being run into by a motor car. The district council made him allowances, and then the owner of the car paid him £40 as damages, out of which he refunded the council what it had paid him. The respondents contended that by accepting the damages he had put himself outside the Compensation Act, which laid down that an injured person could not have both compensation and damages. To this the applicant's answer was that the council knew of the accident and paid him compensation before he was even offered damages, and that bound the council to pay full compensation. The Judge found for the respondents, and gave judgment accordingly, with costs.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to the Editor, St. Bride's House, 21 Bride Lane, Fleet Street, E.C. Every name must be given. Assistants and Students who desire criticisms of their answers should send in their work as early as possible. Two answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

QUESTIONS.

Readers are invited to the following

415. Sewerage. What conditions generally determine the adoption of either the "separate" or the "combined" system of sewerage in a town? (A. in T.)

416. Concrete Floor. Give two sections of a reinforced concrete floor for a span of 30 ft., showing the sizes and weights of the girders, and giving the necessary calculations. (K. G. F., *Buckfastleigh.*)

417. Sewer Construction.—A sewer is being constructed partly in tunnel. Describe a method of giving the levels in the heading, referring specially to the continuation of the line of levels from the surface. (Ving.)

418. Iron Curved Roof. Show details of an iron curved roof of 40-ft. span, resting on girders and stanchions on one side, and on a 14-in. brick wall on the other. The roof is to be covered with corrugated iron. Show enlarged details at the foot of the principal rafter at each end. (K. G., *Buckfastleigh.*)

419. Practical Mathematics.—Explain a graphical method for solving simple simultaneous equations, and give a worked example.

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

414. Strength of Materials.—Prove the formulæ $\frac{M}{I}=\frac{f}{y}$ and $\frac{M}{EI}=\frac{1}{r}$ with respect to beams, and explain the meaning of the symbols used.

(1) Prove $\frac{M}{I}=\frac{f}{y}$.

M represents the bending moment—that is, the algebraic sum of the moments of all the external

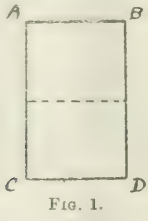

Fig. 1.

loads and reaction acting on one side of a cross-section of a beam.

I represents the "moment of inertia" of a beam,

Fig. 2.

the meaning of which will be clearer if we try to arrive at its value for a simple rectangular beam.

Let ABCD in Fig. 1 represent a cross-section of a beam.

Under the action of a load the beam will deflect into the form represented exaggerated in Fig. 2. From this it is plain that the upper fibres (AB in Fig. 1) will be in compression, and the lower fibres (CD, Fig. 1) in tension; also that midway between these opposite kinds of stresses there must be a layer of fibres where the stress is zero. The dotted line marks the position of this layer on the cross-section, Fig. 1, and it is known as the neutral axis.

It follows from the above that the stress at any point will be proportionate to the distance of the point from the neutral axis.

Let p = stress per square inch at 1 in. from neutral axis and let f_x = " " x in. "

then by proportion $\frac{1\text{ in.}}{\text{in.}}=\frac{p}{f_x}$

$\therefore f_x=px$

If d is the depth of the beam, when $x=\frac{d}{2}$ the stress becomes $p\frac{d}{2}$, and this is the maximum stress on the extreme fibres.

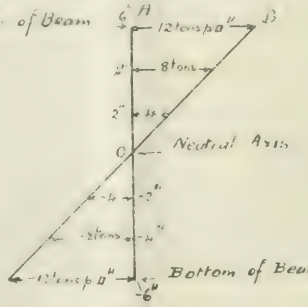

Fig. 3.

Let us take a beam 12 in. deep, and let p (the assumed stress per square inch at a distance of 1 in. from the neutral axis) be 2 tons. Draw a vertical line (Fig. 3) to represent the depth of the beam, and against it draw horizontal lines to represent the intensity of stress at various distances.

Using the equation $f_x=px$ we have—

Values of x	6	4	2	0	-2"	-4"	-6
Values of f_x	12	8	4	0	-4	-8	-12

The negative values of x indicate that the points are below the neutral axis, in that portion of the beam which is in tension—*i.e.*, if $+f_x$ indicates compression, then $-f_x$ indicates tension.

Consider the upper half of the beam. From inspection of the figure it will be seen that the mean stress will be half the maximum—that is

$$\text{or } \frac{pd}{2}=\frac{pd}{4}$$

The total stress on one half of the beam = mean stress × half the area of the cross-section,

$$=\frac{pd}{4}\times\frac{bd}{2}=\frac{bd^2}{8}p \text{ (where } b=\text{breadth)}$$

Now, the resultant of the varying stresses between the neutral axis and the extreme fibres will act at the centroid of the triangle OAB—*i.e.*, at a distance of $\frac{2}{3}\cdot\frac{d}{2}=\frac{d}{3}$ from the neutral axis, and the moment of the total stress on the half beam will be—

$$\frac{bd^2}{8}p\times\frac{d}{3}=\frac{bd^3}{24}p$$

For the whole section, therefore, the moment of resistance will be—

$$\frac{bd^3}{24}f = 2\frac{bar^2}{12}p$$

It will be seen that $\frac{ar^2}{12}$ is dependent only on the geometrical properties of the dimensions of the beam section, and is therefore a constant for any given size of beam. This constant is known as the "moment of inertia," and is represented by the abbreviation I.

Now we have the moment of resistance $\frac{bd^3}{12}p$, where p is the intensity of stress I in from the neutral axis.

But what is more important is the stress on the extreme fibres where it is a maximum.

Let f = the maximum stress,
and let y = distance of extreme fibres from neutral axis,
then by proportion

$$\frac{p}{y} = \frac{1 \text{ in.}}{y \text{ in.}}$$

$$p = \frac{f}{y}$$

Therefore, moment of resistance—

$$MR = \frac{bd^3}{12}\cdot\frac{f}{y} = I\frac{f}{y}$$

To preserve equilibrium the moment of resistance must equal the bending moment:—

$$\therefore M = MR$$

$$= I\frac{f}{y}$$

$$\text{Or } \frac{M}{I} = \frac{f}{y} \qquad \text{Q.E.D.}$$

(*b*) Prove $\frac{M}{EI} = \frac{1}{r}$

M, as before, is the bending moment.

A consideration of E will involve also consideration of the meaning of stress, strain, and elastic limit.

Stress is the amount of force, per unit of area, to which a piece of material is subjected; thus, if a force of 24 tons act on an area of 12 square inches, the stress is 2 tons per square inch. The material will be either stretched or compressed (according to the nature of the force), and the ratio which this change of dimension—say, length—bears to the original length is called the strain.

Up to a certain amount of load this stretch or compression will disappear on the removal of the load; but if the load is increased beyond this amount, the test-piece will be permanently deformed. The point at which this change occurs is known as the elastic limit of the material.

Now, within and up to the elastic limit both stress and strain are proportional to the load producing them, and therefore proportional to one another for the same material, so that, if the stress be divided by the strain, a constant number is produced. The ratio $\frac{\text{stress}}{\text{strain}}$ is called "modulus of elasticity." The particular modulus that refers to a bar under tension or compression is called "Young's modulus of elasticity," and is denoted by "E."

To calculate E we have the relations:—

Let W = load,
A = sectional area of bar in square inches,
L = original length of bar in inches,
e = change of length in inches produced by W,

then stress = $\frac{W}{A}$

strain = $\frac{e}{L}$

$$E = \frac{\text{stress}}{\text{strain}} = \frac{W}{A} \div \frac{e}{L}$$

$$= \frac{WL}{Ae}$$

Let Fig. 4 represent a small portion of a beam, showing an exaggerated curvature produced by bending stresses, and let AB and CD be two cross-sections close together, which before bending were parallel, but which now are inclined and radiating to a centre O. EF is the position of the neutral surface. This remains unaltered in length. Let its length be L. Let r be the radius of curvature of the neutral surface. Draw GH through F parallel to AB. Take

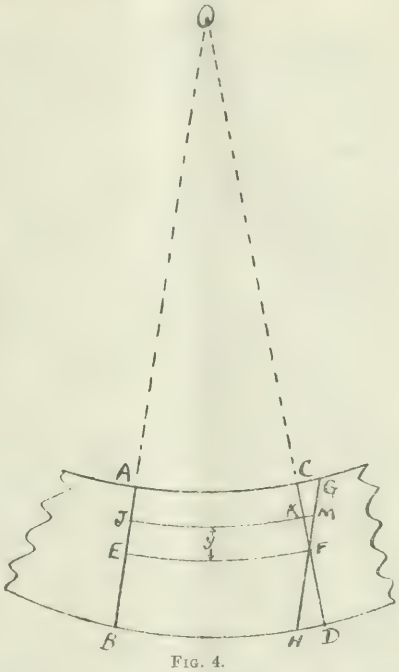

FIG. 4.

any layer, JK at a distance y from neutral surface. It will be seen that this layer has altered in length from EF, or from JM to JK.

Call this alteration in length (KM) e.

$$\text{the strain} = \frac{e}{L}$$

Then, if f is the stress producing this strain,

$$f = E\frac{e}{L} \quad \left[E = \frac{\text{stress}}{\text{strain}} \therefore \text{stress} = E \times \text{strain} \right]$$

$$\text{also } \frac{e}{y} = \frac{L}{r} \text{ (by similar triangles)}$$

$$\text{from which } e = \frac{L}{r}y$$

substituting this value of e

$$f = \frac{E}{r}y$$

but as was previously shown

$$\frac{M}{I} = \frac{f}{y}$$

$$\text{or } f = \frac{M}{I}y$$

$$\therefore \frac{M}{I}y = \frac{E}{r}y$$

$$\frac{M}{I} = \frac{E}{r}$$

$$\text{or } \frac{M}{EI} = \frac{1}{r} \qquad \text{Q.E.D.}$$

(H. G. L., *Practical Mech.*)

Brighton Water Undertaking.—The nett profit of the Brighton Corporation water undertaking last year was between £2,000 and £3,000.

Douglas Municipality's New Estate.—The Douglas Town Council have purchased the Pulrose estate, near Douglas, consisting of over 200 acres of arable land, two farm houses, a mansion, a laundry, and a corn mill, for £19,000. It is the intention of the council to use the property partly for the disposal of such refuse as is not already dealt with by the existing sewerage system, and in all probability a destructor will be erected. At present the refuse is taken out to sea in hopper barges and discharged, but for some time past this system has been very costly.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Chertsey R.D.C. (July 24th. Mr. R. G. Hetherington).—£1,795 for works of sanitation. The evidence was given by Mr. H. Bevan, and the inspector stated that the rate would be 7s. 9d. in the £, and the relief was equal to a rate of 7·16d.

Kettering R.D.C. (July 21st. Mr. R. G. Hetherington).—£1,292 for the purpose of providing a water supply for the parish of Cotton, including the execution of works at Great and Little Oakley.—The details of the scheme were submitted by Mr. Kay, of Messrs. Everard, Pick & Son, engineers. The inspector visited the sites at the close of the inquiry.

Panteg U.D.C. (August 6th. Mr. M. K. North).—£900 for the provision of an open-air swimming bath. It was stated that the site would be enclosed by iron railings, and that the extension of the area was possible. The water was derived from springs in the red sandstone, and the supply had never been known to stop in the driest summer. There would be a continual flow through the bath.

Prestatyn U.D.C. (August 7th. Mr. H. R. Haynes).—£2,800 for the purposes of water supply including the extension of the works in the parish of Meliden, and £300 for the purchase of land for a recreation ground. The surveyor, Mr. F. Wilkinson, stated that the loan for works of water supply was rendered necessary by building extensions. It was asked that the repayment of the proposed loan should extend over a period of fifteen years. With respect to the purchase money for the proposed recreation ground, it was agreed with the inspector that the period should be twenty years.

Rotherham T.C. (August 6th. Mr. Edgar Dudley).—£2,000 for the purposes of the proposed cattle market, and £14,230 for the purchase of the St. George's Hall and the West Riding Court House for the widening of College-square and Effingham-street. It appeared from the explanations offered that it is sought to place the proposed market on the site adjoining the new street, which is now known as Corporation-street. As to the College-square improvement, it was stated that the necessity for street widening at this point was great. Under the scheme a street 70 ft. wide with a 46-ft. roadway, will be possible.

Sheffield T.C. (August 6th. Mr. H. Shelford Bidwell).—£3,615 for the purchase of property in West-street and Fitzwilliam-street; £6,200 for the purchase of Bowden Housteads Wood, Handsworth; £3,685 for works of private street improvement in Blast-lane, Cadman-street, Lumley-street, and Edmund-street; and £6,100 for laying out a part of the Abbey-lane cemetery.—The street widenings were described as necessary in view of the increasing traffic, and as to Bowden Housteads Wood, it was stated that it is proposed to purchase about 100 acres for public walks. Details were submitted of the proposed private street works, and of the cemetery extension, for which it is proposed to acquire 15 acres.

Surbiton U.D.C. (October 6th. Mr. Thomas Adams).—This was an inquiry into the council's application for authority, under Part II. of the Housing and Town Planning Act, 1909, to prepare a town planning scheme with reference to an area situate within the urban district, and affecting approximately rather more than half its area, or about 1,607 acres in all. Evidence was given in support of the application by, among others, Mr. H. T. Mather, surveyor to the council. There were only three opponents.

Sutton-in-Ashfield U.D.C. (August 4th. Mr. H. Shelford Bidwell).—£8,600 for the duplication of waterworks plant and water mains. It was stated that there had been a great increase in the demand for water, and that additional pumping machinery and mains were required in order to guarantee a supply to the outside districts. Mr. Hodson, water engineer, gave details of the proposed scheme.

West Kent Main Sewerage Board (August 4th. Mr. R. G. Hetherington).—£35,300 for purposes of sewage disposal, £1,275 for the construction of a light railway at Long Reach, Dartford, and £650 for the redemption of the tithe rent charge upon the [illegible] Mr. A. B. Coomber, stated that the total quantity of sewage treated per annum at the present time was estimated at 3,321,[illegible],000 gallons. The cost of treating 1,000,000 gallons of sewage, inclusive of the maintenance of all sewers and outfall works, all establishment charges and loan payments (principal and interest) was £6 7s., which was easily the lowest of all joint sewerage boards, the average being £17 12s. 1d. The West Kent Board paid higher wages than most authorities, and the men worked fewer hours. The amount of sludge to be dealt with was estimated at 78,000 cub. yds. per annum, equal to a weight of 62,678 tons. The chairman of the board, Sir G. Woodman, said that what they proposed to do would answer the requirements of the district for another ten years.

APPLICATIONS FOR LOANS.

Barking U.D.C. £3,548 for road construction.

Barnsley R.D.C.—£1,728 for a sewerage scheme.

Barrow-in-Furness T.C. £7,900 for works of street improvement.

Bournemouth T.C.—£5,000, additional loan for works at the Undercliff-drive, and £375 for road widening.

Brighouse T.C. £1,400 for works of paving.

Cheshire C.C. £5,751 for road construction.

Chorley T.C. £4,700 for road works.

Congleton R.D.C.—£2,100 for a sewerage scheme.

East Preston (Sussex) R.D.C.—£1,000 for the construction of four groynes, and other works.

Grimsby T.C.—£4,600 for the purchase of land for recreation, cemetery, and other purposes.

Hereford T.C. £1,000 for new water mains.

Maidenhead T.C.—£250 for road improvement.

Merthyr T.C.—£1,750 for school extension.

St. Albans T.C. £18,976 for sewering and sewage disposal.

Thornbury R.D.C. £2,240 for the erection of eight houses.

Ulverston U.D.C. £976 for cookers and prepayment meters.

Ventnor U.D.C.—£393 for a compound steam roller.

Wallasey T.C.—£1,480 for bowling greens and shelters.

Wigan T.C.—£2,000 for conversions to the water-carriage system.

LOANS SANCTIONED.

Bacup T.C.—£1,200 for sewerage work.

Chorley T.C.—£9,800 for prospective expenditure upon gas mains, and other equipment.

Cork T.C.—£2,250 for machinery at the waterworks.

Islington B.C.—£9,147 for paving works.

Lincoln T.C.—£7,000 for water mains extension; £8,500 for the purchase of a site for a housing scheme.

Lurgan U.D.C.—£2,000 for the purposes of the housing scheme.

Maidenhead T.C.—£200 for the improvement of the river side promenade.

Oswestry R.D.C.—£900 for the Weston Rhyn waterworks.

Rotherham T.C.—£19,432 for the purposes of the electricity undertaking.

St. Annes-on-the-Sea U.D.C.—£39,100 for sewerage works.

Southwick U.D.C.—£950 for private street works.

Torquay T.C.—£5,000 for extensions of electric light mains (repayment in twenty years).

Walton-on-the-Naze U.D.C.—£200 for the purchase of land for a depot.

Whitefield U.D.C.—£350 for the extension of the municipal offices.

Wirksworth U.D.C.—£160 for the installation of automatic controllers on street lamps.

FORTHCOMING INQUIRIES.

£1,000,000 FOR ROAD WORK.

The disorganisation of business consequent upon the European War will undoubtedly throw upon the market a vast amount of partially skilled and unskilled labour. This in turn will cause widespread distress among this class of the community, and their dependents, which will need to be relieved by the various agencies now being established. Under its statutory constitution the Road Board has available a considerable sum—at present over £1,000,000—to provide work upon the roads at such times as these. The Roads Improvement Association is therefore compiling, as rapidly as possible, for submission to the local authorities and the Government departments, a series of suggestions for road improvements in various areas upon which this unemployed labour could be most usefully utilised. The various provincial branches of the Roads Improvement Association have been asked to send in lists for their respective districts. Readers not in touch with any of the Road Improvement Association's branches, who would like to submit proposals, should address communications to the general secretary of the association (Mr. Wallace E. Riche, 15 Dartmouth-street, Westminster, London, S.W.). Details should be forwarded of trunk and important roads that need widening, strengthening and resurfacing where the minimum amount of land is required, or where it can be acquired without much difficulty. Also where the maximum amount of labour will be needed, and where any materials required can, in the main, be obtained locally. Each suggestion forwarded should be accompanied with a note upon the facilities, such as land, material, &c., that are available, and the benefits that will accrue from the proposed works. It will be appreciated that the earlier attention is given to this matter the more opportunities there will be to direct labour and money to works of real public utility and avoid reckless unproductive expenditure.

Northwich Meeting Postponed.—The district meeting of the Institution of Municipal and County Engineers, which it had been arranged to hold at Northwich on September 4th, will not take place.

LOCAL AUTHORITIES AND THE WAR.

Six of the eleven horses owned by the Malden and Coombe Urban District Council have been taken for Army transport purposes.

All employees of the Cardiff Corporation who have been called upon to serve are to be given leave of absence during their military service, and will at the end of the war be reinstated without loss of position or emoluments. The council will pay them, or any person or persons they may appoint, such sums as with the pay they will receive from the Government, will make up their full salaries or wages.

The surveyor to the Plympton Rural District Council, Mr. M. Wickett, informed the council that the War Department had taken so many horses from the district that he was finding great difficulty in continuing the work on several of the roads. After discussion, it was agreed that the surveyors must do the best they could under the circumstances.

It has been agreed that all employees connected with the Newcastle-on-Tyne Town Council who have been called to the colours shall not, on their return, be placed in a worse position than they were in leaving to undertake military duties, and that financial aid shall be given to their wives and children.

At the meeting of the Newport (Mon.) Corporation on Tuesday, Mr. E. A. Charles asked that the Works Committee should consider what schemes, if any, could be submitted to the Development Commissioners, with a view of providing as much work as possible in the town. Alderman Greenland: We are doing that now. Mr. J. Moxon: Even to-day we are sanctioning work which will cost £30,000.

At the quarterly meeting last week of the Roads and Bridges Committee of the East Suffolk County Council, the county surveyor, Mr. W. Jarvis, stated that the committee got most of their stone from foreign parts, and owing to the war he wished for authority to purchase stone from other sources if they were to continue work. The committee decided to continue work, and that on the question of obtaining stone, the chairman and county surveyor should consult each other.

The Queen's-road school, Wimbledon, has been placed at the disposal of the local Voluntary Aid Detachment of the British Red Cross Society, for hospital purposes if required; and the town council will also give the society the use, if required, of their new motor ambulance, which the contractors have undertaken to complete without delay. It has also been decided that the position of every man in the corporation's service who is called up for service shall be kept open for him, and that the wives of those who are married shall receive 15s., and each child 2s. 6d. per week, with a maximum payment of 25s. The place of any man who volunteers for service will also be kept open, and his circumstances will be considered by a special committee of the council. Twenty of the council's stud of horses have been commandeered by the War Office.

The directors of Claridge's Patent Asphalte Company, Limited, announce that they are paying to the wives of all men in their employment who are serving the country in any branch of H.M. Service the difference between the pay of the latter as combatants and their average weekly wages. In addition, the firm are keeping the men's positions open until their return from service.

Until further notice, the head office of the Automobile Association, Fanum House, Whitcomb-street, London, W., will be open day and night, including Sunday, for any urgent messages, telegrams (Fanum, London), or telephone calls (300 Regent). This will apply to the principal provincial branch offices at Manchester (5489 City), Leeds (2027 Central), Birmingham (973 Central), Exeter (1000 Exeter), also Scotland at Glasgow (7199 Central).

New Electricity Works for Rhyl.—The new electric lighting plant for Rhyl, which has been installed at a cost of £4,000, was inaugurated formally last week.

Kent County Fencing Company.—The Kent County Fencing Company, of Crouch, Borough Green, Kent, were last week successful in obtaining the silver medal for the best stand in the miscellaneous display at the Tring Park Agricultural Show.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making information given under this head as complete and accurate as possible.*

[illegible] Borough Engineer, £1,000, housing and [illegible] Dewsbury, £21,147. Newport (Mon.), and [illegible] Bournemouth, £3,000, sewage and [illegible] Huddersfield, £700. Worcester, [illegible] Halifax, £3,000. Newport, £21,000. Deptford, £15,000. Wigan, £9,000. Party [illegible] will be [illegible] Local Government Board Inquiries [illegible]

BUILDINGS.

Bournemouth T.C.—Tenders have been accepted for the erection of refreshment rooms at the West Cliff (estimated to cost £565) and the East Cliff (estimated to cost £500).

Chichester T.C.—Plans of proposed bridges at Donnington and Birdham, estimated to cost £1,000 each, have been submitted to the county council. Each bridge is to be capable of carrying 30 tons.

Glasgow T.C.—In a report to the Parks Committee Mr. [illegible] recommends the erection of [illegible] Park, [illegible] and the [illegible] Kelvingrove Park, [illegible] [illegible] [illegible] [illegible] that part of the park.

Hastings T.C.—The tender of Messrs. Braithwaite & Kirk, of London, at £10,000 has been accepted for extension work in connection with the pier scheme.

Hythe T.C.—The council at its meeting recently received a letter from the Board of Trade consenting to the erection of the last new groyne. The letter, we read in the *Folkestone Herald*, was received with laughter, as the groyne had been erected several weeks.

Kingston-on-Thames T.C.—The council have adopted the estimate of the borough surveyor, Mr. R. H. Clucas, at £212, for the provision of flooring for the swimming bath.

Lindsey C.C.—It has been decided to build a school for 400 girls at Ashby.

Surrey C.C.—The tender of Messrs. S. Kavanagh & Co., at £474, has been accepted for the widening of certain bridges at Tolworth.

Wallasey T.C.—The borough engineer has received instructions to report upon the desirability or otherwise of providing public washhouses on a portion of land which forms part of a site acquired for recreation purposes.

Westhoughton U.D.C.—Information is to be obtained with respect to the cost of construction and maintenance of open-air baths.

HOUSING AND TOWN PLANNING.

Dewsbury T.C.—The council have approved the plans of the borough surveyor, Mr. H. Dearden, for the erection of eighty-seven working-class dwellings in Old Borough Road at an estimated cost of £21,147.

Horwich U.D.C.—The surveyor, Mr. T. Green, has received instructions to prepare plans for working-class dwellings.

Newport (Mon.) T.C.—The council on Tuesday agreed to purchase the Somerton estate, for the erection of 100 workmen's houses.

Pontypool U.D.C.—It has been decided to proceed immediately with the erection of further houses under the Housing of the Working Classes Act.

Seaford U.D.C.—The surveyor, Mr. B. A. Miller, has received instructions to prepare plans and estimates for the erection of two cottages in Chichester-road.

Winchcombe R.D.C.—A tender, at £1,076, has been accepted for the erection of six cottages at Alderton, and another tender at £391, for two cottages at Snowshill.

PARKS AND OPEN SPACES.

Merton and Morden U.D.C.—The recommendation of the General Purposes Committee has been adopted to purchase the Whatley estate, consisting of 14½ acres, at the price of £3,500, for the purpose of a recreation ground.

ROADS AND MATERIALS.

Aberdeen C.C.—The council have agreed to the application of the Aberdeen District Committee to provide and maintain a motor-car for the use of the road surveyor, and to fix the latter's salary at £250 per annum.—It has been resolved by the Aberdeen District Committee to reconstruct by tar consolidation a ¼ mile on the Deeside-road a portion of an experimental section which was laid down in 1908. The committee have also decided to repaint the whole of the section on the Deeside route, the ¼ mile laid at Culter, and the whole of the section on the Inveruric-road, at an estimated cost of £796. An application is to be made to the Road Board for a grant towards the cost of the improvements.

Abergele and Pensarn U.D.C.—The tender of the Penmaenmawr Granite Company has been accepted for the supply of large quantities of macadam.

Amesbury R.D.C.—The surveyor, Mr. J. T. Huxham, has advised the council to repair short [illegible] on the Buttered Cross roads with a bed of 4-in. limestone covered with good, hard granite, at an estimated cost of £255. The council are seeking to obtain a contribution towards the cost of the work from the War Office.

Banbury T.C.—The Road Board have sanctioned a grant of £150 to the council for the purpose of tar-grouting.

Bournemouth T.C.—The general manager of the tramways has received instructions to prepare forms of tenders for the partial reconstruction of the tram line and roadway in Holdenhurst-road, at an estimated cost of £10,000.

Cambridge C.C.—A motion has been adopted directing the Roads and Bridges Committee to consider whether the county roads cannot be repaired "without causing obstruction and danger to traffic."

Chatham T.C.—In pursuance of a report by the borough surveyor, Mr. C. Day, with respect to the cartage of road materials and house refuse, the council have decided to purchase one tractor from Messrs. Aveling & Porter at £138, and three trucks at £63 12s. 4d. each.

Cheriton U.D.C.—A scheme of improvement for High-street has been adopted. It is proposed to carry out the work in three sections, at an estimated cost of £3,000.

Cork T.C.—The Public Works Committee have been asked to prepare a scheme for the improvement of the streets of the city.

East Riding C.C.—The sub-committee appointed to deal with the question of the widening of the main road between Beverley and Hull recommend that the necessary land be purchased from the North-Eastern Railway Company at the price of £600 an acre, and that the county surveyor, Mr. J. Bickersteth, be instructed to prepare detailed plans and specifications for the proposed improvement.

Newhaven R.D.C.—The surveyor, Mr. Arthur C. Groves, reports that in order to make a satisfactory job of the Newhaven-Seaford road it will be necessary to break up the surface and lay down a good, hard foundation. The matter has been referred to the Highways Committee.

Normanton U.D.C.—The surveyor, Mr. A. Hartley, has received instructions to prepare plans and specifications for making up Woodhouse Mount, under the Private Street Works Act, 1892.

Richmond (Surrey) T.C.—The tender of Messrs. Mowlem & Co., Westminster, at £568, has been accepted for making up North-road under the Private Street Works Act, 1892.—Messrs. Mowlem have completed the work of making up the remainder of Leyborne-park, and also the paving of St. Helena Wharf.

Surrey C.C.—It has been agreed to contribute a sum not exceeding £417, one-third of the estimated cost of the purchase of land for widening the London road at Guildford.

Thingoe R.D.C.—With regard to the motor bicycle owned by the district surveyor, Mr. A. R. Cameron, it

has been agreed to grant him in future £20 per annum. In reply to a question as to how many miles he covered in a year, the district surveyor suggested 10,000 miles.

Uckfield R.D.C.—The surveyor, Mr. E. Johnson, reported recently that, as the Rocmac laid last year proved so successful, and £125 having been allowed in the estimates for similar work this year, he proposes with the council's permission to use Rocmac for 200 tons of Quenast granite in Myrtle or Maynards Gate roads, Crowborough, and 200 tons of Jersey granite on the Piltdown-road, Fletching.

Walton-on-Thames U.D.C.—The surveyor, Mr. R. Wilds, submitted recently a report on the final apportionment in connection with the making up of Drewitt's-court under the Private Street Works Act. The cost was £296, and the apportionment 6s. 7.38d. per foot, as against the provisional figure of 7s. 10½d. The reduction was accounted for chiefly by the fact that the work was carried out departmentally instead of by a contractor, the contractor's profit consequently being saved to the frontagers. The chairman, Mr. E. Martin, said he had seen the particular work, and he thought the surveyor had made a very good job of it. It was a very great improvement.

SEWERAGE AND SEWAGE DISPOSAL.

Biddulph U.D.C.—A deputation has been appointed to meet representatives of the Leek Rural District Council, with a view to arriving at a settlement on the Horton sewerage proposals.

Crompton U.D.C.—Proposals are under consideration for the extension of the Low Crompton sewage disposal works, at an estimated cost of £2,000.

Easthampstead R.D.C.—The council have adopted a scheme for sewage disposal for the Binfield district, at an estimated cost of £9,661.

Fifeshire C.C.—The new sewage disposal works constructed by the Kirkcaldy District Committee at Auchterderran were formally opened recently. The works, which were designed to prevent the pollution of the river Ore, have cost between £9,000 and £10,000. The plans were prepared by Messrs. Gilbert Thomson & Ferguson, of Glasgow, and the contractors were Messrs. David Adamson & Co., of Cowdenbeath.

Hailsham R.D.C.—The tender of Messrs. A. Streeter & Co., of Guildford, at £4,933, has been accepted for carrying out the Polegate drainage scheme.

Leyburn R.D.C.—The tender of Mr. A. Scholefield, of Thorne, Leeds, at £2,100, has been accepted for the execution of the Middleham sewage disposal scheme.

Lichfield R.D.C.—The tender of Messrs. G. P. Strentham, of Birmingham, at £6,410, has been accepted for the Burntwood sewage disposal scheme.

North Walsham U.D.C.—A letter has been received from the Local Government Board pressing upon the council the urgency of adopting a scheme for sewage disposal, and stating that the board cannot admit that the result of a poll of the ratepayers relieves them from the responsibility for the public health.

Poole T.C.—The council have adopted the scheme of the borough surveyor, Mr. S. J. Newman, for surface-water drainage in York-road and Queen's-road, at an estimated cost of £654.

Worcester T.C.—Consideration has again been given to the proposed sewerage scheme, with reference to which there has been correspondence with the Local Government Board, and a resolution has been adopted by the council that upon receiving reports from the engineers they would be prepared to carry out such further works as might be necessary to make the scheme satisfactory to the board.

WATER, GAS, AND ELECTRICITY.

Berwick T.C.—Application has been made to the Local Government Board for an extension of the time for the repayment of the loans for the Joint Water Scheme and the drainage of Tweedmouth, in view of the fact that the cost of the scheme has exceeded expectations.

Gloucester T.C.—The tender of Messrs. E. Timmins & Sons, Limited, Runcorn, has been accepted for making and lining a well or borehole; also the tender of the Premier Gas Engine Company, Limited, Sandiacre, near Nottingham, for providing and erecting air compressing engines, machinery, and plant at Ketford waterworks.

Halifax T.C.—A 12-in. main is to be laid from the Albert reservoir to Rolls Head-road, at an estimated cost of £2,000.

Nantwich R.D.C.—The water supply scheme for Audlem and district, estimated to cost £21,000, has been approved by the Local Government Board, and the sanitary surveyor, Mr. C. E. Davenport, has been instructed to obtain tenders.

Stafford T.C.—Water main extensions are to be carried out, at an estimated cost of £350.

Tanderagee R.D.C.—The council have forwarded to the Local Government Board a report by Messrs. Kaye, Parry & Ross, of Dublin recommending a scheme of water supply from wells by means of pumping.

Torquay T.C.—The Waterworks Committee recommend the council to commence the laying of a further section of the new duplicate main from Hennock to Sandford Orleigh, Newton Abbot, a distance of about 9,600 yds., at an estimated cost of £18,000, and that application be made to the Local Government Board for sanction to a loan for the purpose.

Walsall T.C.—The council have decided to build a new gas-holder, at an estimated cost of £9,000.

MISCELLANEOUS.

Torquay T.C.—A special sub-committee has submitted a report that, having regard to the amount and importance of the work for which the borough surveyor's department was responsible, they did not think it possible to make any reduction in the staff if the work were to be carried on in a satisfactory and efficient manner. They recommended that all workmen over seventy years of age should be required to apply for an old-age pension, the council to augment such sum up to the maximum allowed under the Old-age Pension Acts.

PERSONAL.

Mr. W. Wright, borough surveyor of Grantham, has received an increase of salary of £25 a year.

Mr. J. W. Croxford, surveyor to the Brentford Urban District Council, has had his salary advanced to £300 per annum.

Mr. Gordon R. Folland, chief assistant to the county surveyor, Northern Division, Devonshire, has been appointed assistant county surveyor to the Somerset County Council.

Mr. R. T. Davis, of Birmingham, has been appointed quantity surveyor in connection with the new offices scheme for the Barnet Urban District Council, at an inclusive commission of 2½ per cent.

Mr. E. H. Calcutt, ASSOC.M.INST.C.E., has been engaged by the Surrey County Council to undertake the surveys and preparation of estimates for dealing with dangerous corners at a salary of £4 4s. a week and travelling expenses, repayable by the Road Board.

Mr. Edwin Brown, surveyor to the Burgess Hill (Sussex) Urban District Council, has received an honorarium of ten guineas for extra services in preparing plans and carrying out the construction of the automatic filter-beds at the sewage farm. The Works Committee, a councillor stated, had no hesitation when the question was started as to how the work should be carried out in putting it in charge of the surveyor, because they knew he would carry it out thoroughly. The work had been very satisfactory, and the honorarium was a small complimentary assurance of the council's appreciation of his services.

Mr. J. Stanley Sawdon, ASSOC.M.INST.C.E., deputy surveyor of Margate, has been appointed surveyor of St. Annes-on-Sea, at a commencing salary of £250 per annum, with the privilege of taking articled pupils. St. Annes-on-Sea, Lancashire's residential suburb, is one of the newest, pleasantest and healthiest of coast towns, situated between Blackpool and Lytham. The town was designed on spacious garden city lines; it is quite modern; there is not a building forty years old, and during the last ten years the population has more than doubled, and is now 11,000 in the winter and 30,000 in the summer. The rateable value is £100,000. The streets are wide, with residences detached and semi-detached, and there is a uniformity in the size of dwellings in the various thoroughfares, with diversity of architecture. Marine gardens, profuse with

Mr. J. Stanley Sawdon.

a election to the post at Margate appointments at Cheltenham, Staines, Kettering, Uxbridge, North-wood Hayes and Chertsey.

Those of our readers who met Mr. E. L. Powers, the president of the company which publishes *Good Roads*, at the International Road Congress last year, will be sorry to hear that he recently met with a serious accident when driving in his car from New York to his farm at Jamestown, a distance of about 700 miles. Mr. Powers was accompanied by Major W. W. Crosby, who is personally well known to many surveyors and engineers in this country, and who has contributed to our columns several most valuable papers on the subject of road construction and maintenance. It appears that everything went well until the party were within 10 miles of their destination, when, in going around a turn of a by-road, the car skidded out of the road, over the edge of the embankment, ran down into a sloping field and turned completely over, coming up on its wheels again, and stopping. Mr. Powers was caught under the steering wheel as the car went over, and when the latter righted was left lying on the ground in the midst of the luggage which had been dumped. He was able to walk to a house close by, but his injuries were found to be such that it is expected he will be obliged to remain in hospital for some five or six weeks. We greatly regret to learn of the accident, and offer our sympathy to the American Road Builders' Association, of which Mr. Powers is one of the three members who form the Executive Committee, being also secretary to the association.

Chelmsford.
August 13th, 1914. (1857)

GENTLEMAN, with good introductions and connection among Architects, Engineers, and Contractors required to represent leading Asphalt concern in Devon and Cornwall on commission basis.—Apply Box 1457, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C. (1853)

SOUTHAMPTON'S TAR-MACADAM PLANT.

VISIT OF SURVEYORS.

By the courtesy of Mr. J. A. Crowther, the borough engineer and surveyor of Southampton, the opportunity was recently taken by a number of surveyors, engineers and others interested in road-making, to visit Southampton to see the combined drying and mixing plant recently installed by the Southampton Corporation at their West Shore depot.

Fortunately, the day chosen proved to be exceptionally fine, so that the visitors were able, not only to inspect the production of tar-macadam by the plant, and to see the material actually being laid on the roads, and, in addition, to examine roads which had been previously laid, and are at the present time carrying the normal traffic which passes over them.

The visit, which was organised so as to be spread over as many hours as possible, was commenced at 10.15 a.m. at the West Shore depot, apart from the men engaged in feeding stone to the elevating skip, two men only are occupied in controlling and running the drying and mixing machine. One man is essentially occupied in the general control of the discharge of stone through the plant, while the duty of the second is to add the tar to the stone and discharge the mixed product to carts when ready. As each cart is filled, it is taken direct to the scene of laying operations on the road and immediately deposited. Under the present arrangement of working no storing of the mixed material is introduced, and it is found that the machine is capable readily of supplying the demands of the road makers, the output from the equipment averaging from 45 to 60 tons per day.

Ransome Combined Drying and Mixing Plant at Southampton.

After the examination of the plant, a considerable number of the party took the opportunity of visiting the roads where road laying was in actual progress, witnessing *en route* roads which had been made by the mixed material produced from the machine.

Subsequent to this an adjournment was made to the South-Western Hotel, where luncheon was provided by the Ransome-verMehr Machinery Company, Limited, of Brunswick House, Westminster, the suppliers of the combined drying and mixing plant.

At the luncheon the chair was taken by Mr. C. F. Gettings, the county surveyor of Worcestershire, and as is, perhaps, usual on such occasions, lunch was followed by one or two speeches by members of the company, the trend of which was to express the acknowledgment of everybody present of the extreme courtesy of Mr. J. A. Crowther and his worthy lieutenant, Mr. A. E. Dixon, who not only laid themselves out to provide every facility for seeing what Southampton is doing in maintaining its roads and highways, but were only too pleased to supplement actual observations by detailed information which they had naturally obtained as a result of the working experience of the plant referred to.

After luncheon, it was found that some members

[illegible] party [illegible] to return to the depot, while those took a further opportunity of seeing the road [illegible] and [illegible] was [illegible] occupied until the party broke up in order to return to [illegible] various destinations.

It might be observed that all arrangements seemed to be admirably thought out, and, apart from the cars which were kindly placed at the disposal of Mr. [illegible] and Mr. Dixon, saving in the matter from the depot to the roads, &c., was materially [illegible] by the generosity of the Ransomes/Maxi Machinery Company, Limited, of several additional cars, the result being that everybody seemed able to go exactly where they wished, and to see exactly what they wished.

In conclusion, we might add that we endorse the opinion expressed by Mr. Gettings that meetings such as this are of material advantage in assisting all those interested in the maintenance of roads in appreciating developments which are taking place from time to time, and thereby obtaining information, not only of [illegible] surveyors, but also to the community at large.

SOME RECENT PUBLICATIONS.*

CLEAN WATER AND HOW TO GET IT. By Allen Hazen. (Second edition, revised and enlarged.) Price 6s. 6d. nett. London: Chapman & Hall, Limited.

"Taking it right through, probably one half the water supplied to American cities is wasted" is one of the statements made by Mr. Allen Hagen in his most interesting and valuable book. As will be seen, he does not spare criticism where it is required, but neither does he fail to show the great advances made recently in America, and the perfection of methods where deserved.

Although the problems which confront the American engineer differ considerably from those which have to be dealt with in this country, all English water engineers will do well to read Mr. Hagen's work, and will learn much therefrom which may be applied usefully to work at home. The quality of waters derived from lakes and rivers is specially considered, and the best methods of treatment are very clearly described. The important questions of the action of water on pipes, red water or rust troubles, the nature and methods of purifying water and disinfection, are considered; while the book also treats of the storage of filtered water, the required sizes of filters, the pressure under which water is delivered, the use and measurement of water by meters, the laying-out of works, and financial matters.

It seems to be inferred that all the really important methods of purification in general use are described, and if this claim is made it certainly appears that the Puech Chabal system ought to have been mentioned, seeing that it has been installed at many large and important works. Also it would have been interesting to have read the author's remarks upon the rotary sprinkler used on the slow sand filter, which may be seen in this country at such works as Bedford, and which seems to have been used with great success in France.

Again, the author appears to claim that the use of hypochlorite of lime for the sterilisation of water dates from the application of hypochlorite to the Jersey City water in the year 1908. The water supply of Lincoln was sterilised by hypochlorite in this country in the year 1904.

From other remarks made by Mr. Hagen it seems that it would be of material advantage on both sides if English and American engineers were better informed of each other's progress, or lack of progress. A careful study of Mr. Hagen's book is therefore advised.

A Glossary of Road Terms (By H. Percy Boulnois, M.INST.C.E., St. Bride's Press, Limited, 24 Bride-lane, E.C., Price 2s. nett).—The movement towards standardising the principal roads throughout the United Kingdom has rendered it necessary to correlate the nomenclature of road terms in use in different districts, and Mr. Boulnois has compiled a glossary with the hope that it may form a basis for such a correlation.—*Times Engineering Supplement.*

*Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

CROYDON RELIEF ROAD.

LOAN SANCTIONED.

We [illegible] the Local Government Board [illegible] a loan [illegible] for the purpose of the Croydon Relief Road [illegible] Croydon Corporation.

The estimates for this work include, we believe, [illegible] to be carried out by labour and materials. Such a work as this, if put in hand at once, [illegible] to relieve [illegible] to be otherwise be out of work.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. J. S. PICKERING, M.INST.C.E., Borough Surveyor and Water Engineer, Cheltenham.

CLEETHORPES MEETING.

A meeting of the institution will be held at Cleethorpes on September 19th.

SCARBOROUGH MEETING.

A meeting of the institution in the North-Eastern District will take place on Saturday, September 26th, at Scarborough.

J. W. DUDLEY ROBINSON, B.SC.(LOND.),
Secretary.

92 Victoria-street,
Westminster, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. HORACE BOOT, M.I.E.E., M.I.MECH.E.

Owing to recent happenings, it has been decided to abandon the visit to Hunstanton, which was announced for the 15th inst. The visit to the South Metropolitan Gasworks, arranged for the 13th inst., has also been abandoned.

Meetings will be held at Sunderland on Saturday, October 10th, Newcastle on Saturday, November 7th, and Newcastle on Saturday, December 12th.

A Northern District meeting, in combination with Yorkshire, will be held at Harrogate on Saturday, September 12th.

B. WYAND,
Secretary.

39 Victoria-street, S.W.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

COUNTY SURVEYOR'S ENGINEERING ASSISTANT.—August 17th.—County Council of Salop. £3 3s. per week.—Mr. A. T. Davis, county surveyor, County Buildings, Shrewsbury.

COUNTY SURVEYOR.—August 19th.—Longford County Council. £250.—The Secretary, County Council Office, Longford.

ROAD FOREMAN.—August 19th. — Cheltenham Town Council. 40s. per week.—Mr. J. S. Pickering, borough engineer.

CHIEF ENGINEERING ASSISTANT. — August 20th.—Corporation of Bedford. £150—£200 per annum.—Mr. N. Greenshields, borough engineer and surveyor, Town Hall, Bedford.

ARCHITECT'S CLERK.—August 22nd.—Felling-on-Tyne Urban District Council (Education Committee). —Mr. R. Hall, clerk.

SURVEYOR AND INSPECTOR. August 28th. Mere (Wilts) Rural District Council. £150 per annum. —Mr. R. H. Hiscott, clerk, Council House, Mere.

SANITARY INSPECTOR.—August 25th. Lewes Asylum of the county of Ross and Cromarty. £160 per annum, with expenses.—Mr. H. Miller, district [illegible], Stornoway.

TEMPORARY SURVEYOR'S ASSISTANT.—August 27th.—Isle of Thanet Rural District Council. £2 2s. per week.—Mr. Chas. Taylor, clerk, Board Room, Margate.

GENERAL FOREMAN.—August 27th. Corporation of Wokingham. 37s. 6d. per week.—Mr. C. W. Marks, borough engineer and surveyor.

CLERK OF WORKS.—August 27th. Fleet (Hants) Urban District Council. £4 4s. per week.—Mr. W. H. Wright, clerk.

SURVEYOR'S ASSISTANT.—August 29th. Uxbridge Rural District Council. £2 per week.—Mr. C. Woodbridge, clerk, 38 High-street, Uxbridge.

CLERK OF WORKS.—Langport Rural District Council. £2 5s. to £3 3s. per week, according to experience and suitability.—Mr. J. Mathison, Langport.

HIGHWAY SURVEYOR.—Boston Rural District Council. £140 per annum.—Mr. H. Smyth, clerk, 10 New-street, Boston.

MUNICIPAL COMPETITIONS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

LONDON.—September 7th.—Designs for two new schools, for the London County Council.—The Clerk, Spring-gardens, London, S.W.

GLASGOW.—September 18th.—Plans for buildings proposed to be erected at the north-west corner of Trongate and High-street. Premiums, £50, £30, and £25.—Mr. J. Lindsay, town clerk.

ST. HELENS.—October 31st.—Drawings of police buildings and fire station, for the St. Helens Corporation. Premiums, £100, £50, and £25.—Mr. A. W. Bradley, borough engineer.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Buildings.

ROCHFORD.—August 17th.—For the erection of four cottages, for the rural district council.—Mr. O. C. Madge, surveyor.

EVESHAM.—August 17th.—For the erection of thirty workmen's houses, for the rural district councils of Evesham and Pebworth.—Mr. E. H. Wadams, clerk, Union Offices, Evesham.

BRISTOL.—August 18th.—For the erection of public baths, for the corporation.—Mr. L. S. McKenzie, city engineer and surveyor.

ALDERSHOT.—August 18th.—For extensions to electricity buildings, for the urban district council—The Surveyor.

SOMERSET.—August 18th.—For the erection of a school, for the Education Committee.—Mr. A. J. Pictor, architect, Bruton.

COOKHAM.—August 18th.—For the removal of existing bridge, and building a wood and girder bridge, for the rural district council.—Mr. R. Stuart Lloyd, district surveyor, Queen-street Chambers, Maidenhead.

BARNET.—August 19th.—For the erection of twenty-four cottages, for the rural district council.—Mr. A. J. Wilshire, surveyor, Shenley-road, Boreham Wood.

BLACKPOOL.—August 19th.—For extensions to abattoir buildings, for the corporation.—Mr. J. S. Brodie, borough surveyor.

HERTS.—August 20th.—For the erection and completion of a new special subjects centre at Stevenage, for the county council.—Mr. Urban A. Smith, county surveyor, Hatfield.

BARNSLEY.—August 21st.—For the erection of an open-air school, for the Education Committee.—Mr. E. W. Dyson, architect, Regent-street, Barnsley.

EASTRY.—August 24th.—For the erection of six cottages, for the rural district council.—Messrs. Jennings & Gray, 4 St. Margaret's-street, Canterbury.

TREDEGAR.—August 24th.—For the erection of a fire station at Harcourt-terrace, Tredegar, for the urban district council.—Mr. W. Edgar Jones, architect, 1 Commercial-street, Tredegar.

ST. AUSTELL.—August 25th.—For the erection of thirty-two workmen's dwellings, for the rural district council.—Mr. W. H. Moffat, surveyor.

LANCASHIRE.—August 25th.—For the erection of a school, for the Education Committee.—Mr. H. Littler, architect, 16 Ribblesdale-place, Preston.

ABERTILLERY.—August 26th.—For alterations and extensions to a school, for the Education Committee.—Mr. W. H. Hiley, architect, Chapel-street, Abertillery.

BRIGHTON.—August 27th.—For the erection of a clock tower in Queen's Park, for the corporation.—Borough Surveyor.

GWYRFAI.—August 28th.—For the erection of thirty-six workmen's dwellings, for the rural district council.—Mr. J. W. Thomas, surveyor, 22 Castle-square, Carnarvon.

NORTH RIDING.—September 4th.—For the erection of a school, for the Education Committee.—Mr. J. C. Wrigley, secretary, Education Offices, Northallerton.

SHEERNESS.—September 7th.—For the demolition of engine-house and the construction of a new building and other works, for the urban district council.—Mr. F. W. S. Stanton, engineer, 3 Victoria-street, Westminster, S.W.

Iron and Steel.

MARPLE.—August 19th.—For the supply of spigot and socket cast-iron or steel gas mains, for the Gas Committee.—Mr. J. K. Law, gas engineer, Marple Bridge.

MANCHESTER.—August 25th.—For the supply of cast-iron pipes for heating purposes, for the Tramways Committee.—Mr. J. M. McElroy, general manager, Corporation Tramways, 55 Piccadilly, Manchester.

KEIGHLEY.—September 5th.—For the supply of cylinders for reservoir works, for the corporation.—Mr. M. R. Barrett, engineer, Town Hall.

Roads.

SPENNYMOOR.—August 17th.—For making up a certain road, for the urban district council.—Mr. C. R. Spencer, surveyor.

WIGTON.—August 17th.—For the road maintenance of certain districts, for the rural district council.—Mr. T. B. Simmons, surveyor.

REIGATE.—August 18th.—For supplying and laying creosoted wood block paving, for the corporation.—Mr. F. T. Clayton, borough surveyor.

ISLE OF WIGHT.—August 19th.—For the execution of road improvements, for the rural district council.—Mr. L. A. Cozens, surveyor, Walmer Villa, Castle-road, Newport, I.W.

MELTON MOWBRAY.—August 19th.—For asphalting certain streets, for the urban district council.—Mr. E. Jeeves, surveyor.

STOCKPORT.—August 20th.—For making up a road, for the corporation.—Mr. J. Atkinson, borough surveyor.

SOWERBY BRIDGE.—August 22nd.—For supplying setts and making up certain streets, for the urban district council.—Mr. James Eastwood, surveyor.

HALIFAX.—August 24th.—For grouting with pitch or other approved material 30,000 super. yds. of granite macadam, for the corporation.—Mr. J. Lord, borough engineer.

EPSOM.—August 24th.—For the supply of road materials, for the rural district council.—Mr. T. E. Ware, surveyor, Waterloo-road, Epsom.

BARNET.—August 24th.—For providing and laying tar-macadam, for the urban district council.—Mr. W. B. Chancellor, engineer and surveyor.

EASINGTON [illegible] for the supply and laying [illegible] private streets, for the rural district council.—Mr. G. Watkinson, surveyor.

BRIGHTON [illegible] for the supply of dressed kerb and channel, for the corporation.—Borough Surveyor.

SOUTHAMPTON.—September 7th.—For the execution of private street works, for the corporation.—Borough Engineer.

ITCHEN.—September 7th.—For executing works in certain roads, for the urban district council.—Mr. [illegible]

CLUTTON [illegible] for [illegible] rolling and scarifying, for the rural district council.—Mr. J. S. Drury, clerk, Temple Cloud, Bristol.

Sanitary.

COWBRIDGE.—August 17th.—For the construction of sewerage [illegible] disposal works, for the rural district council.—Mr. G. S. Morgan, 23 Gelliwastad-road, Pontypridd.

HENDON.—August 17th.—For sewerage and other works, for the urban district council.—Mr. S. S. Grimley, engineer.

SALFORD.—August 17th.—For the construction of a sewer, for the rural district council.—Borough Engineer.

STAFFORD.—August 17th.—For work of sewerage, for the rural district council.—Mr. J. W. Cook, surveyor.

CHERTSEY.—August 18th.—For the construction of two circular bacterial filters, 80 ft. diameter, containing a total of 2,248 cub. yds. of destructor clinker; also small humus tank with pipes and appurtenances, for the rural district council.—Messrs. Elliott & Brown, Burton Buildings, Parliament-street, Nottingham.

REIGATE.—August 18th.—For the construction of surface-water sewers and manholes, for the corporation.—Mr. F. T. Clayton, borough surveyor.

FLEET.—August 20th.—For the construction of about 16 miles of stoneware and cast-iron sewers, brick, concrete, and cast-iron manholes, flushing tanks, ventilating shafts and columns, cast-iron rising mains, air mains, engines, compressors, ejectors, and other works incidental thereto, for the urban district council.—Mr. T. J. Moss-Flower, engineer, 28 Victoria-street, Westminster, S.W.

MARTLEY.—August 20th.—For the construction of 2¼ miles of 9-in. and 6-in. sewers, with manholes, lampholes, sedimentation tanks, bacterial filters, humus tank, sludge beds, and other incidental works, for the rural district council.—Messrs. Willcox & Raikes, Union Chambers, 63 Temple-row, Birmingham.

OULTON.—August 20th.—For the removal of house refuse and cleansing cesspools, for the urban district council.—Mr. C. G. Taylor, clerk, Victoria Chambers, Lowestoft.

RUNCORN.—August 21st.—For the construction of sewers and sewage disposal works, for the rural district council.—Messrs. J. Diggle & Son, 14 Victoria-street, Westminster, S.W., and Hind Hill-street, Heywood, Lancashire.

OGMORE.—August 21st.—For the construction of a culvert and sewers, for the urban district council.—Messrs. John Taylor & Sons, Caxton House, Westminster, S.W.

SWANSEA.—August 29th.—For laying pipe for surface-water drainage, for the rural district council. Mr. G. Powell Thomas, surveyor, Station-road, Fforestfach.

TOTTINGTON (Lancs).—September 1st.—For the provision and laying of about 8,060 lin. yds. of cast-iron and stoneware pipe sewers, manholes, and storm-water chambers; also alterations to screening chamber, and tanks, and the construction of sedimentation tanks, percolating filters, humus tanks, sludge beds, channels, and diversion of stream course, for the urban district council.—Mr. L. Kenyon, engineer, Council Offices.

RHYMNEY VALLEY.—September 9th.—For the construction of main outfall sewer, about 10 miles long, for the Sewerage Board.—Messrs. Wilcox & Raikes, 9 Victoria-street, Westminster, and Mr. T. J. Thomas, 36 High-street, Bargoed, Glam.

ALEXANDRIA.—December 8th.—For the construction of a sewerage system, for the municipality.—"M. le Président de la Commission Municipale d'Alexandrie," Alexandria.

Stores.

ROCHESTER [illegible] for the supply of tools, horse hire, forage, Portland cement, brooms, oils, paving materials, road metal, and coal, for the corporation.—Mr. William Banks, city surveyor.

Miscellaneous.

MIDDLETON.—August 18th.—For the supply of two petrol-driven motor fire engines, for the corporation.—Mr. F. Entwistle, town clerk.

WOODFORD.—August 18th.—For the installation and maintenance of "Knight" street fire alarms, for the urban district council.—Mr. W. Farrington, [illegible]

CHIPPING WYCOMBE.—August 24th.—For a two-cell refuse destructor, with water-tube boilers, for the corporation.—Mr. T. J. Rushbrooke, borough [illegible] and engineer, High Wycombe.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted. † Recommended for acceptance.
‡ Provisionally accepted

ARNOLD.—For making up a road, for the urban district council.—Mr. R. F. Clarke, surveyor.

A. & C. Rayner, West Bridgeford	£1,859
E. Somerfield, West Bridgeford	1,837
G. Baldwin, Nottingham	1,819
A. Weaver & Sons, Arnold	1,765
J. Harrison & Sons, Limited, Arnold	1,736

CHINGFORD.—For making up parts of certain streets, for the urban district council.—Mr. J. P. Griffin, surveyor.—

E. J. Betts, Enfield Highway, N.	£1,352
T. Adams, Wood Green, N.	1,234
G. Porter, Clayton, N.E.	1,115
W. Myers & Co., Leyton	1,084
[illegible] Bruchmont Hill*	990

DURHAM.—For the construction of 185 lin. yds. of 15-in., 12-in., and 9-in. pipe sewers, manholes, ventilation columns, and street gullies [illegible] the rural district council.—Mr. Geo. Chester, surveyor.

P. Oliver, Gilesgate Moor	£157
J. Carrick, Durham*	153

GUILDFORD.—For the erection of twenty cottages, for the corporation.

Dennett & Cooper, London	£5,374 (£48)
W. Sawyer, Guildford	5,350 (£20)
P. Spoil, Guildford	5,300 (£88)
Tribe & Robinson, Guildford	5,130 (£95)
J. M. Rutter & Co., Guildford	5,060
W. Bullen & Son, Guildford	4,994 (£74)
R. Wood & Son, Guildford	4,825 (£55)
F. & H. Higgs, Cobham	4,784 (£80)
Crosby & Co., Limited, Farnham	4,690 (£65)
Shipwell Brothers, Farnham	4,673
Reeves & Port, Rudgwick	4,645 (£60)
T. Higgs, Moore-street, Northampton*	4,419 (£52)

The figures in parentheses represent the amount to be deducted if Solignum be used.)
The above amounts include an item of £150 for contingencies.

HUNSLET.—For making up private streets, for the rural district council.—

J. Mannion, Leeds, £830.

MARLBOROUGH.—For laying 226 yds. of 6-in. cast-iron pipe sewer in the college grounds, for the corporation.—Mr. G. Parker Pearson, borough surveyor:

W. T. Nicholls, Gloucester	£207
W. E. Free, Marlborough	190

ST. HELENS.—Accepted for granite paving work, for the corporation.—Mr. A. W. Bradley, borough engineer:—

J. Riddel, New Ferry.

ST. HELENS.—Accepted for making up certain streets and passages, for the corporation.—Mr. A. W. Bradley, borough engineer:—

J. Riddel, New Ferry.
R. Heaton & Son, St. Helens.

ST. HELENS.—Accepted for tar-macadamising a road, for the corporation.—Mr. A. W. Bradley, borough engineer:—

Ceiriog Granite Company, Limited, Chirk.

SALOP.—Accepted for the rebuilding of Ifton Heath council school, for the county council.—Mr. H. E. Wale, Shrewsbury.

H. Dorse, Cradley Heath, Staffs, £2,769.

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

SEPTEMBER.

19.—Institution of Municipal and County Engineers: Meeting at Cleethorpes.
26.—Institution of Municipal and County Engineers: Meeting at Scarborough.

OCTOBER

9. Royal Sanitary Institute: Meeting at Shrewsbury. Discussion on "The Value of Mechanical Filters in the Purification of Water." 7.30 p.m.

The Surveyor

And Municipal and County Engineer.

Vol. XLVI. AUGUST 21, 1914. No. 1,179.

Minutes of Proceedings.

New York Sewage Disposal Problem.

As stated by one of the experts who was consulted in the matter, this is "the largest and most complex sewage disposal problem which has yet required a solution." That this opinion is quite correct is demonstrated by the final report recently issued by the Metropolitan Sewerage Commission of New York. This enormous volume contains 760 pages of text, including numerous diagrams and tables, with, in addition, some twelve maps inserted, and even then many of the records of the work done by the commission have unavoidably been omitted. The commission has been engaged for eight years considering and investigating the most effective and feasible means of permanently improving and protecting the purity of the waters of New York bay and neighbouring waters. The final recommendations include the construction of intercepting sewers running approximately parallel to the water front to collect the sewage from the local sewerage systems and convey it to a number of centrally situated disposal plants, where the impurities are to be removed to such an extent that the effluent may be discharged into the waters without creating danger or nuisance. As an indication of the size of the works that would be required for dealing with the sewage, it should be noted that the population in 1910 was just over 4,500,000, but it is increasing so rapidly that it was considered desirable to provide for a population in 1940 of 9,000,000, and an estimated volume of 1,330 million gallons of sewage per twenty-four hours, which is equal to 148 gallons per head per day.

A large amount of the information contained in this report is naturally of purely local interest, but there is also much that should be of great service to municipal and other engineers in all parts of the world, who are under a debt of obligation to the members of the New York Commission for the admirable manner in which the results of their investigations have been made available for the use of their brother engineers in other countries. In the first place, we may note the basis upon which the Commission and its staff were organised, and particularly the appointment as president of the commission of a technical man capable of personally directing the scientific and technical work of the large staff of trained engineers, chemists, and bacteriologists. Secondly, the commission have taken advantage of the experience gained by others engaged in this branch of work by inviting twenty of the best qualified experts, including four from this country, to assist them by criticism, both constructive and destructive, of their proposals. Among these experts were engineers, chemists, biologists, medical officers, and even a professor of statistics, and their reports, which are published in full, are worthy of very careful study. Another praiseworthy feature is the promptitude with which the final report has been issued. The commission completed its work at the end of April last, and in less than three months their final report was printed and issued, not only to all concerned, but available even in this country. In addition to this, the commissioners immediately resigned and left the position clear for the appointment of the permanent commission they recommended for the purpose of carrying out their proposals. Another feature of interest is the boldness with which the problems of construction were attacked. This is apparent from a study of the drawings attached to the report, which set forth the design of enormous sewers up to 14 ft. diameter, carried in some places at great depths under hills, in other places, in the form of inverted syphons, under large rivers, and even out into the sea, and finally by the novel proposal to build an island of about 50 acres in area, situated in the sea about 3½ miles out from the shore, for disposal works.

With regard to the methods of treatment to be adopted for the disposal of the sewage, these vary according to the degree of purification necessary to meet the different conditions at the separate outfalls. In all cases grit chambers will be provided on the main trunk sewers at or near the disposal works, and these will have a settling period of from one to two minutes in order that the velocity may be reduced sufficiently to allow heavy mineral matters to be deposited without arresting much organic matter. In such cases fine screens alone, in other cases coarse screens followed by sedimentation, are recommended, the screenings and sludge being disposed of by some of the at present known methods, whichever happens to be most suitable for the local conditions. It is important to note that, in all cases, the outfalls for the clarified sewage are to be arranged to terminate at some distance from the shore, and always at depths of from 30 ft. to 50 ft., and, in order to facilitate thorough diffusion with the water, the sewage will be discharged through several openings at each outfall. Finally, it is anticipated that the whole of the impurities which remain in the sewage after the preliminary treatment outlined above will be satisfactorily oxidised by dilution in the waters of the harbour without creating a nuisance. The question as to the amount of dissolved oxygen which must be maintained in the water in order to prevent the production of gases which would cause a nuisance was thoroughly investigated and discussed, and in this connection the report affords a mine of information for those who may have similar problems to solve. It appears that the commission originally proposed to recommend a restriction that the average dissolved oxygen con-

[illegible] the harbour water should not be allowed to fall below [illegible] per cent of saturation. Eventually, however, they decided that it would not be necessary to make this restriction, for the reason that if the other requirements are complied with there will be sufficient oxygen in the water for the purpose. In the opinion of some of the experts consulted, it would be impracticable to maintain a uniform minimum standard for all parts of the harbour water; while others believe that a much [illegible] would be sufficient to prevent any nuisance arising when the [illegible] sewage matters and sludge are prevented from entering the harbour. So far as river [illegible] is concerned, our own Royal Commission on Sewage Disposal expressed the opinion that it would be desirable to maintain not less than 60 per cent of saturation in order to prevent nuisance arising, and this agrees closely with the standard originally proposed by the Metropolitan Sewerage Commission for the waters of New York Harbour.

* * *

Municipal Motors.

The use of motor vehicles for municipal purposes is a question which has been exercising the minds of many of the larger local authorities of late, and considerably any reliable information as regards the efficiency of a motor service as applied to such matters as the removal of house refuse and street cleansing and watering cannot fail to be of interest. On a recent occasion the Holborn Borough Council appointed a special sub-committee to inquire into this matter, and Mr. E. F. Spurrell, the borough surveyor, has prepared a most valuable report, in which he discusses the possibility of improving the systems [illegible] in force in the borough in the light of modern methods and experience. In many parts of London the municipal motor is already a familiar sight. For example, the City Corporation owns six motor vehicles, which are used for the collection of refuse and street watering. Then, again, Chelsea has no fewer than sixteen such vehicles at present in use for similar purposes, while Westminster possesses seventeen. The general conclusions drawn by Mr Spurrell from his investigations in these and other districts is that the steam wagon on steel tyres is cheaper to run on municipal work than the petrol motor on rubber tyres. It is no doubt true that the former type of vehicle is open to objection on the score of its greater noise and vibration, but this disadvantage is not so great as might appear at first sight, owing to the fact that a wagon engaged in municipal work, and in travels at a speed of more than about 5 miles an hour.

The main question, however, is one of finance. In what circumstances and under what conditions can municipal work be carried out by means of motor wagons at a cost less than or at all events as small as that which would be incurred by the use of team labour? To this question Mr. Spurrell makes the general reply that a motor van is intended to move, and that it pays while it is travelling, but not when it is crawling from door to door. It follows that for such work as watering, flushing, and sweeping the motor is invaluable, but the collection of house refuse presents an entirely different problem, and in this department motor traction has not shown such good results. The report under consideration attributes this fact to want of system, and suggests a novel plan by the adoption of which the application of the motor to this work would become economically possible. The plan is for half-a-dozen men to precede the motor van, so that the portable bins are in the street ready to be tipped into the van when it arrives. There is no reason why a motor van should not proceed slowly through a street, the contents of the various small portable bins being thrown into it while it is on the move, and proceed to the shoot when loaded, carrying considerably more refuse, and at a quarter of the time occupied by a horse-drawn vehicle. Moreover, this system would prevent the sorting over of the refuse by the dustman at the van's side, as is now a common practice.

Mr. Spurrell's report concludes with a table showing the comparative cost of using motor appliances in the borough, and the present cost of horse transport. From this it appears that for dusting and slopping, day watering, night flushing and gully cleansing the actual cost would be slightly greater, although the increased expense would no doubt be accompanied by an even greater increase in the efficiency of the services named. The cost of mechanical sweeping, on the other hand, would actually be reduced by the adoption of the motor appliance. The report is one for the publication of which many municipal engineers will be grateful.

* * *

Road Widening and Sanitation in Bombay.

Like Shakespeare's heroine, the Bombay Municipality has a divided duty to discharge in which respect it has a strong resemblance to other municipalities—judging by the fact that the claims of road making and the claims of sanitation have their special advocates among the members. The Improvement Trust of Bombay has authority conferred upon it with respect to the construction of new roads, and criticism at a late meeting was directed against its policy of acquiring "set-backs" for the widening of streets at a high cost, of making up the roads in a more or less unsatisfactory manner—it was categorically stated that in several instances main roads were not sufficiently strong as regards foundations to bear the volume of traffic—and subsequently handing them over to the municipality in this condition for future maintenance. A suggestion having been made that a concrete bottoming should be provided, it was humorously retorted that this was precisely the quality in which Improvement Trust was notoriously wanting, as to which our own knowledge is professedly deficient. The defence set up by the Commissioner was that the increased expenditure on roads brought the municipality a correspondingly increased revenue. This was the case with new roads, at all events, but it was admitted that as regards old roads that had been widened the financial benefit was not so apparent. The fact is, of course, that Bombay, like other towns no longer in their first youth, has to pay substantial sums for the purchase of property for the purpose of widening its old, narrow thoroughfares, but the idea that this necessarily entails financial loss cannot be entertained seriously for a moment. Given a capacity to bear the burden, a municipality can hardly undertake a more desirable responsibility, alike from the point of view of sanitation or commercial success, than the improvement of its streets. The period for the repayment of the loans for road improvement forms a grievance with municipalities in India, as it frequently is in this country. The Bombay Municipality succeeded in raising one of its last loans for a period of forty years, and it is hoped that this term may be extended in future. But whether this prospect will bring solace or satisfaction to that section of the municipality that believes that sanitation is being neglected while road improvement is flourishing is indeed very doubtful. One feature, alike interesting and full of promise, emerges from the proceedings as we read them in the *Times of India*—viz., the native members of the corporation would appear to be zealous and even enthusiastic in their wish to see still larger sums spent upon the general sanitation of the city and upon improving certain areas in particular that doubtless stand in need of regeneration and reform.

Wiltshire Main Roads.

At the last meeting of the Wiltshire County Council an entirely unjustifiable attack was made upon the district surveyors responsible for the maintenance of the main roads of the county. The occasion was a recommendation on the part of the county surveyor that the county council should themselves undertake the maintenance and supervision of the whole of the main roads at present repaired under contract by the rural district councils. We have no desire to criticise the recommendation of the county surveyor, even if we were in a position to do so; although it appears from a circular letter signed by nine of the district surveyors and addressed to the chairman and members of the county council that the main roads in question have been maintained by the district councils or their predecessors since the abolition of the turnpikes, and it is contended that the work has been performed both economically and satisfactorily. What we do complain of, however, is the tone of the speech in which Mr. Docking, a member of the county council, attempted to raise the question. To begin with, he was desirous of having the matter discussed before the members of the council had had an opportunity of perusing the report of the county surveyor. Then instead of debating the matter as one of policy, he proceeded to make an attack upon the thirteen district surveyors *en bloc*, alleging that the county surveyor had been complaining for a long time past that the supervision of the roads was entirely inadequate, and that there was no one to see that the men were earning the wages which they were paid. It is a little difficult to understand this statement in the light of the county surveyor's report for the year ending March, 31, 1913, in which he says that, taking his last annual report as a basis, "there is a steady improvement in the condition of the roads in the contract districts." Some idea as to the real facts may be gathered from the letter from "One of the Ten," which appears in another column. Moreover, if Mr. Docking's statements are correct, it has always been open to the county council to give any defaulting district council notice, under sec. 11 (8) of the Local Government Act, 1888, to put the roads in repair, and if this notice was not complied with to do the work themselves and charge the district council with the cost.

* * *

Security of Tenure.

Writing in the *Empire Review* on "Civil Servants and Security of Tenure," Sir Charles Bruce lays down certain principles which we venture to think are equally applicable to the case of the municipal officer. He says: "Security of tenure depends on the recognition of two rights—the right to a definite statement of any charges made a ground of accusation, in order that an officer may have a full opportunity of reply and defence, and the right to an inquiry by an independent and impartial court or tribunal." Again, he points out that it would be a grave error to suppose that the question of security of tenure is limited in its consequences to the personal interests of the individual officers concerned. Security of tenure is the only safeguard of liberty of opinion, and liberty of opinion the only bulwark against the tyranny of bureaucracy. It would be difficult to find other words in which to put the whole case at once so concisely and so clearly. Our own views on this question are well known and need not be repeated here. Sir Charles Bruce's propositions exactly fit the case of the municipal engineer whose professional duties bring him into personal antagonism with a member of his authority. If he had security of tenure, he would also possess liberty of opinion, "the only bulwark against the tyranny of bureaucracy." Further, in the event of an active manifestation of such tyranny, he would have recourse to an independent tribunal, instead of being compelled, as at present, to accept as final the decision of a body of which his opponent is a member and he himself an officer. It is, of course, impossible for us to discuss the merits of the particular case in the Civil Service with reference to which Sir Charles Bruce writes. We can only say that if municipal engineers only enjoyed the same security as the established civil servant at present has, they would consider themselves much more fortunately situated than is now the case.

* * *

The Microscopy of Drinking Water.

The Microscopy of Drinking Water," by Mr. George Chandler Whipple,* is a book of a more practical character than its title suggests, and one which contains much that is of great importance to those engineers who have to deal with storage reservoirs and their waters. In the preface the author states that the work is elementary in character. It is certainly a book which any water engineer might read with advantage, with the strong probability that he would forthwith buy a microscope and thenceforth develop a new interest in life—namely, that of discovering in the waters, reservoirs, water mains and tanks with which he has to deal some of the causes of his troubles in the shape of the organisms described by Mr. Whipple, and shown so clearly in the excellent illustrations and coloured plates contained in the volume. That these organisms are the direct or indirect causes of various troubles—such as bad odours in water, colour, coating of mains, and other effects—is abundantly clear, and Mr. Whipple's collection of facts and instances form a most valuable work of reference. In particular, the section dealing with the stripping of the soil on the sites of reservoirs, with its record of results, will be of interest to all those who are concerned with the construction of storage or impounding reservoirs. The instances of the removal of odours from waters by means of filtration are also extremely interesting. The author appears to hold the opinion that it is more economical to treat the water after storage than to rely upon the entire removal of vegetable matter from the site before filling a storage reservoir.

* * *

The Road Board's New Appointment.

We offer our hearty congratulations to Mr. H. P. Maybury, M.INST.C.E., and to the authority he serves, on his appointment as manager as well as engineer to the Road Board. The appointment is significant, as it is evident that in his position as manager, Mr. Maybury will have to deal with the re-organisation of the department, under the capable control of the chairman of the board, Sir George Gibb. It has often been suggested in the past that in some ways the board was not quite in touch with local authorities and their officials, but with Mr. Maybury as manager it is evident that this little difficulty will soon be adjusted. Mr. Maybury has the great advantage of having been at one time the surveyor of an important town, and subsequently the county surveyor of Kent, so that he is thoroughly acquainted with the procedure and requirements of municipal and county undertakings. His practical knowledge also of road construction and maintenance will be invaluable to the board in the distribution of their grants and loans. It was a happy inspiration that prompted the board to make this appointment, and we shall no doubt very soon see the beneficial results which are bound to follow under this new management.

* Third edition, rewritten and enlarged. Chapman & Hall 17s. nett.

Road Improvement in the North of Ireland.

By [illegible], A.M.I.C.E., M.R.I.A.I., County Surveyor, Tyrone (North).

It will be generally admitted that [illegible] the United Kingdom has taken a [illegible] part in the practical work, and it is therefore not to be wondered at if its inhabitants have been giving much consideration to the question of road maintenance.

It may not, therefore, be considered altogether unprofitable and uninteresting if I endeavour to focus attention on a problem which must very shortly come to be recognised as of pressing importance to this community.

In order that I may be understood by those who are not familiar with our system of local government as applied to road maintenance, I must explain that in Ireland all rural roads are under the direct control of the district councils, with whom all and every expenditure must originate. The county councils cannot originate any road maintenance expenditure, though they may, and do, provide the necessary plant for the purpose. The executive officer, under whose supervision all work is carried out, is the county surveyor. There are no independent district surveyors in the sense in which they are known in Greater Britain, but the district councils have no direct control over the county surveyor or his staff of assistants. The maximum annual sum which any district council can apply to road maintenance—known as the "Limit of Expenditure"—is fixed by law. Formerly, from time immemorial, all road work had been done by contract, men undertaking to maintain a length of road in proper order at so much per local perch—and until comparatively recently any other way of getting work done was illegal.

It will be easily understood that anything like continuity of policy, even among the various districts in the same county, is difficult of attainment, while as between adjoining counties, it is unknown. Prior to the year 1899, when the present system of local government superseded the Grand Jury system, it was almost without exception the case that the traffic was relied upon to make the roads. County surveyors, as a body, had long before recognised the absurdity of this arrangement; nevertheless, it was some years before they were able to convince the district councils that it was their duty to reverse the process and make the roads for the traffic. So far as the nine counties of Ulster are concerned, this elementary principle is now generally recognised.

Naturally, the first step in carrying out the new policy was the introduction of steam rollers, machine stonebreakers, and so forth, and for a time everybody was satisfied with the rapid improvement of road surfaces. Had the traffic problem remained as it was, all would have been well. The coming of the motor, and more especially the introduction of the commercial motor, which has been extraordinarily rapid in the North-east of Ireland, has entirely altered the conditions with which the district councils have to deal, and the methods of maintenance must inevitably be altered, if the roads are to continue to carry the traffic.

The problems which confront the Northern county surveyors at the present time are: (1) How to meet the universal demand for roads strong enough to carry the new traffic, and smooth enough to carry it with comfort to the users, without (2) at the same time exceeding the statutory "Limit of Expenditure."

As regards the first, the "Man in the Street" will probably say "Surely this same difficulty has been experienced and solved long since in Greater Britain! Why not adopt the same methods which have proved efficacious across the water. Tar treatment is bound to put an end to all complaints!" Many of our district councillors, and the whole motoring public, have seen and heard of the wonderful results of tar treatment—I use the term in its widest sense—and not unnaturally they have jumped to the conclusion that all that was wanted was to go in for that treatment and the trouble would be over. Unfortunately, we county surveyors find that the problem is not going to allow itself to be settled in this off-hand fashion. It is admitted that, given the best material in sufficient quantity, the failure of so-called "water-bound" macadam roads under normal traffic is largely due to the penetration of water into the foundations and its lodgment there, and in the crust itself. To combat these two distinct sources of weakness the crust may be made impervious and an efficient system of subsoil drains provided, but it has been found that any attempt to waterproof the surface while the subsoil remains waterlogged inevitably results in failure, and is sheer waste of money. Nor can anyone familiar with the North of Ireland fail to have observed that, as a general rule, the level of the subsoil water—as shown by the state of the side drains—cannot at most be more than a few inches below the level of the road surface itself; or, in other words, the foundations are waterlogged.

The most ardent advocates of tar cannot but admit that, so far as the rural roads in the North of Ireland are concerned, the treatment has been anything but a success, and undoubtedly the chief cause for this has been the almost entire absence of artificial subsoil drainage. There are at least two other causes for this want of success, and in regard to these it is difficult to see how they are ever to be disposed of. While our total rainfall is not greater than in many other parts of the United Kingdom, the number of days upon which some rain falls is very great. The result of this is great interference with the work of manufacture and laying, and a consequent increase in cost, beyond all reason. Again, during the winter and early spring there are a great many nights during which there is a slight "hoar" frost—probably three or four every week. The slightest frost of this kind makes any tarred surface so slippery that it is quite impassable for farmers' horses next day until the sun is well up, and it is too late for the day's market.

My own observation and experience would go to show that it is open to very grave doubt whether or not "tar" treatment will ever solve the resurfacing problem in the North of Ireland. The probability is that a binder which will give a somewhat rough surface, and which can be prepared and laid down irrespective of climatic conditions (except frost or snow), is much more likely to meet our requirements. One thing is clear—before we can hope that tar treatment will really lengthen the life of the road crust to such an extent as to justify the additional cost very considerable sums of money must be devoted to improved drainage. In this connection it is rather unfortunate that the Road Board policy in Ulster has, for so far, been to look with a more friendly eye on projects for tar treatment than on those for improved drainage.

Turning now to the second phase of the problem—the question of finance—we find ourselves in a most difficult position. As has already been mentioned, the maximum total annual expenditure of each district council is fixed, and cannot be exceeded without the consent of the Local Government Board. This, however, is easily enough

obtained, if a council wishes it; but, unfortunately, the fact that an increase in the "Limit of Expenditure" involves a corresponding increase in the rates is sufficient to make most councils hesitate about "asking for more." Accordingly, this solution can only be applied as a last resource. The ardent motor owner, who has just paid his annual tax (with the feeling, which we all know of having got but poor value for our money), gravely asserts that all the money paid to the county council by motor car owners cannot fail to be of substantial assistance. Nothing could be further from the reality. Each county council only gets a refund of 5 per cent of the money collected on cars registered in it, and gets this money in such a way that not one penny of it can be directly applied to road maintenance or improvement. Were it paid to the district councils, to swell the "Limit of Expenditure," even the 5 per cent would be of some assistance, but as it is the money is simply swallowed up in the common fund.

It is only through the Road Board grants that any of the money contributed by motorists under the Finance Act, 1910, can become a help, and these grants have, for so far, a way of turning out disappointingly uncertain.

The amateur lawyer suggests that immediate proceedings should be taken under the Public Roads (Ireland) Act of 1911 for the recovery of damages done by all commercial motors. That there are circumstances under which resort to this Act is justified I am prepared to admit; but, on the other hand, when the facilities which a service of motors must undoubtedly give to the whole community are taken into consideration, a council which availed itself of such legal proceedings in every case could only be regarded as short-sighted and retrograde in the extreme. On the other hand, it is notorious that the proprietors of such vehicles are not running them from purely philanthropic motives, and they might very reasonably be expected to pay a tax on the same scale as is applied to motor cars. As the law stands, these vehicles are exempt from taxation—a state of affairs which is surely anomalous.

There is, however, one way by which the financial stringency would, to a certain extent, be eased for some years to come. I refer to the adoption of carefully thought-out schemes of "direct labour," embracing all the important roads, thereby setting free the money which now goes as clear profit into the pockets of a road contractor, and making it available for road work. Up to the present only three Ulster counties have "direct labour," schemes in operation, and recognised by the Local Government Board as such.

It is extraordinary how strongly a North of Ireland district councillor is opposed to "direct labour" in his public capacity; in his own personal business the man realises its advantages to the full. The explanation is, I think, to be found in a deep-seated belief that money paid to an official is money wasted.

Unquestionably the success of any direct labour system depends entirely on efficient supervision, which can only be obtained by the appointment of an additional staff. At any rate, it is a fact that direct labour has spread much more rapidly in the south and west than in the north, and that is not a thing of which Ulstermen should be proud.

I have drawn attention to the questions which are exercising the minds of the northern county surveyor, and have tried to show why, in my opinion, it is quite possible that the most satisfactory surface for North of Ireland roads may not be found along the lines now recognised by the majority of English road authorities. This possibility enables me to draw attention to a difficulty which has made itself felt by every enterprising county surveyor in Ireland. I refer to the impossibility of obtaining funds for undertaking experimental work. Under the existing law, the application of the rates in such a way is quite illegal. Of course, by means of certain roundabout and casuistic reasoning, some trifling work of the kind may be indulged in (I have done it myself), but there is no chance of following an experiment through to a practical conclusion. It is to be hoped that in the near future the Irish Local Government Board will be granted the power to relax its rules as to what may be regarded as legitimate expenditure by county councils. A series of experiments and observations on similar lines to those at present in progress in Scotland financed by the county councils, and carried out with the co-operation of the Road Board, could not fail to be of the greatest scientific and practical value.

NOTES ON TAR-MACADAM WORK.

By "Cretaceous."

Distilled tar should be used in order to procure a first-class material, especially where it is necessary to lay the tar-macadam a few days after the mixing.

In cases where the material can be allowed to mature for a period of about eight or nine weeks, gasworks tar will give excellent results. Exposure to the air causes the light oils, &c., to evaporate; consequently, the setting properties of the macadam are vastly improved.

If it should be necessary to lay the material a few days after the mixing, a small proportion of lime added to the tar and stone during mixing will improve its setting properties. The lime generates heat, and therefore tends to drive off light oils, &c.

Roads in country districts are generally some considerable distance from railway stations, and it frequently happens that the material cannot be carted at a rate sufficient to enable the rollers to work full time. In these cases it is necessary to clump the tar-macadam on the roadsides so that it can be barrowed and spread when sufficient material has been accumulated to keep the rollers and gangs working at a reasonable pressure. Large clumps should be made, and the material in them kept as high as possible. Before commencing to remove the material, it is advisable to spray a small quantity of hot tar over the side of the clump next to the passing traffic.

The objection to small clumps is mainly due to dust raised by motor traffic adhering to the tar, and the amount of earthy material which would be shovelled up with the lower layers of the heaps.

Should it be necessary to scarify a surface prior to treating it with tar-macadam, the disturbed crust should be tightly steam-rolled before the new material is applied.

It has been found an advantage to water the old surface during hot weather before spreading the tar-macadam. Paradoxically, it is not advisable to sprinkle water on the roller wheels; a better job can be made by keeping them clear of tarry material by constant brushing with hard brooms.

The finished coating should be tar-painted and dusted with slag dust as soon as the material has worked to a smooth surface under the action of traffic. Under ordinary heavy traffic the tar should be lightly applied fourteen days after the completion of the rolling work.

It has been the practice to tar-paint tarred macadam every other year. The life of the material can be much prolonged by lightly painting soon after rolling, and every subsequent year.

Applied Geology in Municipal Engineering.—In the course of the discussion of Dr. Lapworth's paper on this subject at the annual meeting of the Institution of Municipal and County Engineers at Cheltenham, Mr. S. S. Platt, borough surveyor of Rochdale, mentioned that in all his works he insisted upon all his assistants recording information as to the strata passed through in all trenches and excavations, and that the information obtained was exceedingly valuable, and would be useful in the future, especially in places where the ground changed very rapidly and the changes could not be foreseen. We find that in our report on p. 223 of last week's issue the word "especially" appeared as "except"—an error for which we express our regret to the speaker.

PONT EBBW BRIDGE.

BUILT FOR THE MONMOUTHSHIRE COUNTY COUNCIL.

By William Tannel, F.S.I.
County Surveyor.*

Situated about 2½ miles from Newport, on the road and railway from that town and the city of Cardiff, the new Monmouthshire ferro-concrete bridge described in the present issue spans the river Ebbw, a tributary of the river Usk, flowing through Tredegar Park, the Monmouthshire seat of Lord Tredegar, well known as one of the few remaining survivors of the Balaclava Charge. The old bridge, of which a photographic view is given in Fig. 1, was inconveniently narrow, and situated at an awkward angle. Moreover, the road had an undesirable twist on either side of the bridge. Consequently, when it became necessary to remodel the structure, it was decided to provide for a considerably increased width, and also for a much-needed highway improvement with the object of abolishing the bends on either side of the river.

Figs. 1 and 2.—The Old and New Pont Ebbw Bridges.

Fig. 2 is a view of the new bridge, and Fig. 3 a site plan where the position of the old bridge and the line of the road are indicated by broken lines, the new bridge and the remodelled road being shown in continuous lines. Inspection of this plan will enable the reader to see at a glance the greatly improved traffic facilities afforded by the reconstruction works, and the rearrangement of the approaches from Newport and Cardiff respectively.

Fig. 4 is from a photograph making clear the main features of the design, and Fig. 5 includes drawings showing the construction of the new bridge. The new portions of the three arches are carried by ordinary concrete abutments and river piers, the latter including the old masonry piers, as indicated in the half-transversal section and half plan.

All three arches are of the monolithic type, being fixed at the springings and enclosing the old brick arches. The new portions vary in width up to 20 ft., and are about 10 ft. 6 in. wide at the middle of the [illegible]. They are 12 in. thick at the springings and 6 in. thick at the crown. Earth filling is deposited over them to the extent of the road foundation, the arrangement of the roadway and footpaths being represented in Fig. 5. The spandrel walls and parapets are in ferro-concrete, and although the design is exceedingly simple, the general [illegible] is of distinctly pleasing character, and the remodelled [illegible] harmonises very well with its surroundings.

The work was designed by the writer and his assistant, Mr. S. A. Bennett, the contractors being Messrs. E. Turner & Sons, Limited, of Cardiff.

* Mr. Tanner's article is reproduced from the August number of *Ferro-Concrete*, by kind permission of the proprietors.

ROAD BOARD.

MR. MAYBURY'S NEW POST.

We understand that the Road Board have made some changes in the organisation of their staff, and Mr. H. P. Maybury, who became chief engineer to the board in November last, has been appointed to a new post with the title of "manager and engineer."

Bristol Tramways to be Municipalised.—The Bristol Corporation Tramways Act, authorising the corporation to purchase the undertaking of the local tramway company, has received the Royal Assent.

Improved Tar-spraying in Bombay.—The *Times of India* of June 9th reported that the new tar-sprayer purchased by the Bombay Corporation had been working on the city streets. The work upon which the machine was engaged was an experiment so far as Bombay is concerned, but should it prove successful it is understood that the corporation will purchase additional machines, and employ them freely on the main roads.

"Good Road Days."—Monday and Tuesday last were "good road days" in Missouri, and, armed with a pick and shovel, Governor Major led the men of the State in the betterment of the highways. The workers give their services free. Last year, when Governor Major inaugurated the scheme, 250,000 men responded to the call, and in the two days gave work and material estimated to have saved the State $1,500,000. Even greater results are expected this year. The results proved so popular that many other States followed suit, and more will imitate this year. Thousands of Missouri housewives prepared free lunches for the workers.

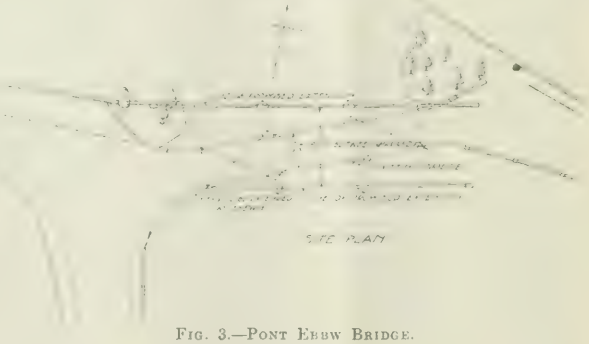

Fig. 3.—Pont Ebbw Bridge.

SUMMER SCHOOL OF TOWN PLANNING.

COURSE AT UNIVERSITY COLLEGE.

The University of London has inaugurated the study of town planning by holding a summer school at the new School of Architecture at University College. The newly appointed professor of town planning, Mr. S. D. Adshead, M.A., I.R.I.B.A., is giving a short series of lectures, and, in addition, all the best-known authorities on the subject are contributing to the course. The lecturers include Mr. Raymond Unwin (The Practice of Town Planning), Mr. Patrick Abercrombie (Town Planning in the Past and Abroad), Mr. Edmund R. Abbott (Legal Aspects of the Subject), Mr. G. L. Pepler (Engineering and Surveying Problems), Mr. H. V. Lanchester (Tradition and City Development), Mr. Thos. H. Mawson (Public Parks and Gardens), and Mr. John Nolen (Town Planning in America).

The shadow of the war has hung heavy over the course, and a number of visitors from America and the Continent were obliged to withdraw at the last moment. Dr. Brinckmann, Professor at Carlsruhe, who was to lecture on German town planning, was unable to attend, and several of the students who are members of the Territorial Force were called up on the second or third day of the session. About forty members have still been able to follow the course throughout however.

At a reception held at University College, the members and friends were received by the provost of the college (Dr. T. Gregory Foster), Mr. Raymond Unwin (chairman of committee), Mr. Herbert Samuel, president of the Summer School, being unfortunately prevented from attending by the European crisis. In his absence the address was delivered by Mr. Raymond Unwin.

Town planning, said Mr. Unwin, was one of the last arts to be learned and practised by civilised peoples. They little thought when they planned that gathering that it would be held at the beginning of an upheaval which might bring European civilisation down in ruins, and could hardly fail to affect its development profoundly. It seemed that, after so much progress, the peoples of the world were still full of helplessness, as though the organisation of life had not kept pace with the overwhelming growth and complication of mere material development. The nations seemed overwhelmed by a complexity they had not learned to control. But there was a distinction between the nation as a whole and the people of which it was made up. Many of them have friends in other countries, and had been hopeful of a combination of effort between the peoples of different parts of Europe in the service of a joint forwarding of social and civic amenities, and they could not help being saddened by this abrupt downfall of their hopes.

Mr. Unwin spoke of the growth of town planning as a subject of university teaching, especially with reference to the recent appointment of Prof. Adshead as Professor of Town Planning in the University of

Fig. 4. Pont Ebbw Bridge.

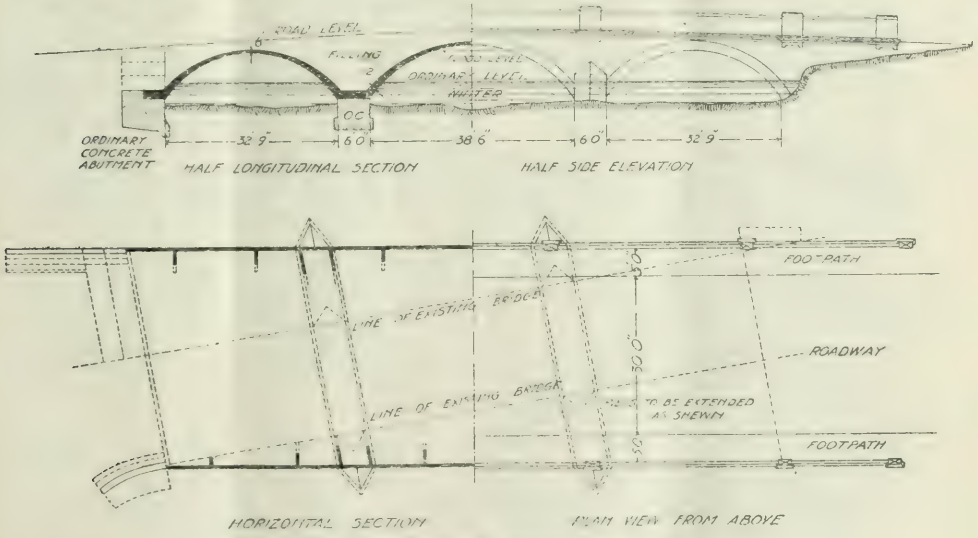

Fig. 5. Pont Ebbw Bridge Structural Details.

[illegible] The summer school now being held in the university city, started ten years ago at Harpenden under [illegible] suggestion of Mr. J. S. Rath[illegible] [illegible] and from the beginning a [illegible] [illegible] [illegible] and being the result of the organising work. The university, in securing the services of Mr. Adshead as Professor of Town Planning, had been fortunate in having the advantage of Prof. Adshead's experience in organising the first school of town planning at Liverpool. Prof. Adshead brought to his new duties a wide training in architectural work, and an ease in exposition. He had had the honour of being appointed by the King to attend and report on the Prince of Wales' visit to South London, and added to his [illegible] skill the charm of an engaging personality.

The [illegible] of social life which town planning [illegible] [illegible] and Mr. Unwin "the power [illegible] and the pleasure of associated life. The complexity of modern civilised life was not, perhaps, a gain to the planner of towns, who ought rather to lift himself above the multifariousness of to-day, and see if it was not possible to build cities which should express a more wholesome simplicity of human relationship. Mr. Unwin gave an eloquent and vivid picture of the more primitive conditions of life in ancient Athens, in which, although the majority of men were no better off than our agricultural labourers, a [illegible] of perfection in art was reached which has never been surpassed in these later days. A similar instance was quoted by Mr. Unwin in Pathos, an old walled town in which the population [illegible] more than 9,000, which had [illegible] itself upon the common life of its farmer population for its art and development, and which stood to-day as a model of a town perfectly adapted to its needs, and clothed in all the dignity and simplicity of a native art.

Dr. George Fowler, Provost of University College, welcomed the members to the new buildings of the School of Architecture, and stated that with the [illegible] courses in town planning and [illegible] engineering would be established.

A telegram from the President of the Local Government Board, in which good wishes for the success of the school and of the town planning movement were expressed, was read.

Mr. Thos. H. Mawson, in the course of a lecture on "Parks and Gardens," said that, at the present time, when every mind was obsessed with the war, and hardships must fall on the working classes of this country, the subject of his lecture was most opportune. Of the different classes of work for the relief of distress none could compare with the construction of public parks and gardens. Such work seemed to come naturally to every Britisher, who was by nature a [illegible] and lessons of this fact was always prepared to give in return adequate recompense and [illegible] any wages he might receive.

Sewage Outfall Screens.—Mr. Sidney Palmer, borough surveyor, St. Ives, Cornwall, writes: "I should like to ask a question through THE SURVEYOR of surveyors to other seaside resorts, if I may: My council have instructed me to fix some sort of cage on the mouth of the sewage outfall for the purpose of catching papers, &c., which in certain tides get [illegible] on the beach. Has such a contrivance been used elsewhere? If so, I should esteem it a favour if any of your readers would give me any information that would be helpful."

Truro City Water Supply. We learn that, with a view to improving the filtration of the water supply of the city of Truro, and of bringing the works into line with the most modern system of supply, it has been decided to substitute Candy mechanical filters for the present open sand filters. At the seventy-second half-yearly meeting of the Truro Water Company, held on the 1st inst., the directors reported that the further installation of Candy filters would soon be in operation, and that the cost of working the new filters would be considerably less than the expenses attendant on the sand beds, while the capital cost of the Candy filters is much below the heavy expenditure that would have been incurred by the construction of the area of additional sand beds necessary for giving an adequate supply of properly filtered water. The cost of the new Candy mechanical-pressure filters, about £1,400, will be paid out of the balance of profit after the 6 per cent dividend is paid, and there will then be a balance of £2,049 carried forward.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

In view of almost wholesale unemployment and general distress, is it not possible to arrange in some way for a conference of surveyors to consider the best means of dealing with it? Although by this time every surveyor is, no doubt, well prepared with schemes for employing the unemployed, would it not be of great assistance if there could be some such meeting [illegible] at which each surveyor might be able to say what he intended to do, and thus assist those who were not so well prepared with [illegible]?

* * * *

Failing such a conference, could not surveyors throughout the country send a short statement of their suggestions for insertion in the columns of THE SURVEYOR, and thus secure the publicity which is needed?

* * * *

Is it not a fact that hitherto there has always been found great difficulty in times of distress to suggest really useful improvements which could be carried out by the class of men who swell the ranks of the unemployed? Should not everyone in a position to do so assist at this juncture with suggestions as to municipal works that would be useful?

* * * *

Is it a fact that the Road Board have commandeered all the bituminous materials that they can find in this country so as to prevent the prices going to a prohibitive figure, and thus interfering with the road work which the board hope will be duly put in hand to allay the labour distress which may eventually have to be considered?

* * * *

In connection with this inevitable distress, can nothing be done to stop the foolish and even criminal drinking which is proceeding at an excessive rate in most of the public houses throughout the country and especially in London? Cannot these foolish people realise that the money they are now squandering in drink will be sorely needed when the pinch of unemployment comes?

* * * *

Would it not be possible to obtain an "honours" list of all those surveyors who at this crisis in the world's history are taking an active part in the defence of their country? Could not their names, and the names of their assistants be ascertained and published in the columns of this paper and in the *Journal* of the Institution of Municipal and County Engineers?

* * * *

How many people are there who realise the importance of the great health movement that has been going on in this country during the last twenty years? Are they aware that in the past twelve years the annual death-rate throughout the country has been reduced from 16·9 to 13·3 per 1,000; that the deaths from typhoid fever have gone down by more than one-half; and that those from "consumption" have declined by 14 per cent? Should not the surveyors and medical officers of this country be proud of their share in the good work that has been accomplished?

* * * *

How many surveyors have read the excellent course of lectures on "Army Sanitation" by Lieut.-Col. C. H. Melville, M.B., published in the *Journal* of the Royal Sanitary Institute, vol. xxxii., commencing on p. 169? Would they be surprised to hear that these lectures contain an immense amount of practical suggestions for the wellbeing of troops on the march and in camp, and that their study at the present juncture would be of inestimable value to the surveyor who is anxious to give assistance to the War Office?

Business as Usual.—Messrs. L. G. Mouchel & Partners, Limited, the concessionaires in this country for the Hennebique system of ferro-concrete construction, wish to refute any rumours to the effect that, owing to the large number of men who have left their employment for the seat of war, both French and English, their business is disorganised. Although twenty-five of their employees have joined the colours, they still have an efficient staff numbering fifty, and will use their utmost endeavours to maintain the business of the country, and to ensure the continued employment of the thousands of workmen engaged upon the various contracts with which they are connected.

The Sampling of Sewage and Other Liquids.*

By G. BERTRAM KERSHAW, M.A.M.SOC.C.E., F.G.S., F.R.M.I.Soc., F.I.S.E.

A very usual object for which samples of sewage and various other liquids are taken is to ascertain the character or bacterial quality of the liquid sampled, and thereby to determine the degree of efficiency with which a particular plant is performing its functions, as, for example, the purification effected by a particular sewage by tank treatment and percolating filters. At other times it may be taken simply with a view to finding out whether the quality of the liquid produced complies with a particular standard.

In the former case, in order to be in a position to judge of the efficiency of the plant, it is necessary to know the strength and character of the sewage as well as the quality of the effluent. In the latter case this is unnecessary, the sample either passing or failing to pass a given standard.

It is of the highest importance that the sample used and shall be duly representative of the bulk of liquid from which it is taken, otherwise erroneous deductions may be drawn. Inasmuch as quantitative analyses are necessarily somewhat costly, and gauging sewage flows often involve a good deal of trouble and expense, it is very advisable, on these grounds alone, that the sample or samples drawn shall be as nearly representative as possible.

Nearly all waste liquids, especially those resulting from industrial processes, vary, not only in character but also in volume, from minute to minute, from hour to hour, and from day to day. Sewages, moreover, may also vary seasonally by reason of the influx of subsoil water and other factors; they vary markedly when heavy rainfall occurs.

If it is desired to ascertain the quality of a particular liquid at any given time, a single sample (termed a "chance" sample) will often suffice for the special or casual purpose for which it is taken. If, on the other hand, the character and strength of the liquid as a whole is what is to be determined average samples will be essential—that is to say, samples drawn according to the rate of flow of the liquid over at least four days.

SEWAGE LIQUORS.

It will be obvious in the case of sewage liquors, which in dry weather vary in strength roughly according to the rate of flow, that if the hourly proportional flows for five consecutive hours are 10,000, 30,000, 50,000, 30,000 and 20,000 gallons then samples merely drawn in equal quantities every hour will not represent the average strength of the liquid for the five-hour period unless the sewage is hourly of constant strength; whereas, if the samples are drawn hourly according to the rate of flow in quantities of, say, 100 c.c., 300 c.c., 500 c.c., 300 c.c., and 200 c.c., and mixed together, an average sample closely approximating to the truth will result. It follows, therefore, that in sampling for average strength the hourly rate of flow of the sewage must be ascertained; in other words, the flow must be gauged continuously while sampling is in progress.

Average samples of sewage liquors were taken as long ago as 1872 by the committee of the British Association at the Romford sewage farm, and probably long before that date, for liquors other than sewage. Average samples of sewage liquors have also systematically been taken by the Sewage Disposal Commission appointed in 1898, and it may be of interest to describe the method of taking average samples of sewage from start to finish, since sewages and sewage liquors are more likely to be of general interest than the sampling of waste liquors from manufacturing processes.

The first preliminary to be settled is the duration of the period over which the samples are to be taken. In the majority of cases four sets of twenty-four hours average samples, commencing Monday morning and ending Friday morning, will give a good idea of the character and strength of the sewage. In the case, however, of a large town, sets of average samples extending over seven days, repeated at different seasons of the year, may be necessary. In the case of domestic sewages from small communities, the first four or five days of the week usually constitute a sufficient period to provide data upon which, say, works could be designed; the omission of sampling the Saturday and Sunday sewage, which is often weaker than normal on these particular days, provides a certain factor of safety.

It is always desirable to draw average samples of sewage in dry weather, and hence it is necessary to determine what shall be regarded as dry-weather sewage flow.

The extent to which rainfall will affect the sewage flow will depend very largely upon local conditions, such as the nature of the sewerage system, the character and gradients of the surfaces of the drainage area contributing to the sewers, together with many other factors; but it depends, other things being equal, chiefly upon the intensity of the rainfall. For example, a rainfall of ·05 in., or even more, following dry weather, and spread evenly over several hours, may produce little or no appreciable effect upon the flow of sewage, certainly not sufficient to put a stop to the taking of samples; but the question of continuing or abandoning drawing of samples must be left to the discretion of the sampler, who will generally be able to gain some idea from the sewage works manager as to whether or not the sewage flow is being materially affected by rainfall.

If two or three days precede the sampling operations, so much the better: but it is impossible to predict seven to ten consecutive days of dry weather in this country.

Since an automatic height recorder in connection with the gauging operations is advisable whenever it can be obtained, it is a good plan to fix a weir and run the recorder for seven to ten days before actually commencing sampling, thus obtaining a series of charts showing the general run of the sewage flow; comparison with these charts when rainfall occurs will generally show when it is inadvisable to continue sampling for the time being.

With regard to rainfall records at most sewage works of any size, a rain gauge is kept on the works, but if there is not one in use, a 5-in. gauge is easily erected, and records should be taken at 9 a.m. daily during the sampling. If a rain gauge is to be found in the town itself, daily records should be obtained from this source also, as it by no means follows that the rainfall in the town and on the works will be identical.

APPARATUS.

Now, as regards the apparatus required for taking twenty-four hours average samples of crude sewage, about thirty, or, better still, thirty-six wide-mouthed glass-stoppered bottles will be needed for chemical analysis; the use of the extra bottles (apart from chance of breakage) will be apparent later.

If samples for bacterial analysis are needed, a few small glass-stoppered sterilised bottles will also be wanted; these will generally be sent ready sterilised direct from the laboratory, and one or two of such bottles can be filled from the large mixing bottle when the twenty-four hours' average sample is made up. The stoppers of all the bottles, both chemical and bacterial, should be carefully ground in with fine emery, and the foot of each stopper rounded to avoid shutting in air bubbles.

As regards capacity, the larger bottles should hold about 600-700 c.c. each, and the sterilised bottles about 50 c.c. each. A large glass mixing bottle, holding about 1½ gallons, will be wanted for making up the average sample from the twenty-four separate hourly samples, and also a couple of thick glass stirring rods, and a measuring glass graduated in cubic centimetres; two thermometers, grease chalks, two or three drying cloths, and some adhesive labels complete the outfit. The bottles used for holding the mixed twenty-four hours' average sample are generally half-winchesters, holding about 1,300-1,400 c.c. each; but for special purposes a winchester is sometimes required.

Turning to the gauging outfit required: The method of gauging employed will depend upon local conditions. Whenever practicable, a wooden dam, with a brass or gunmetal rectangular weir plate screwed to the face of it is the simplest method, the whole of the flow to be gauged passing over the weir, and the depth of liquid over the weir sill being registered continuously by an automatic height recorder. "Plastic," or a mixture of clay and boiled linseed oil, is useful for making watertight joints between the margins of the wooden dam and the channel walls.

* Paper read at the Annual Congress of the Royal Sanitary Institute at Blackpool.

[illegible] to be quite certain that [illegible] connection on the [illegible] of the [illegible] of the [illegible] of [illegible] and [illegible] to be kept [illegible].

3. The width of the weir should not exceed about one-third the width of the channel in which it is placed.

4. The distance [illegible] the liquid falling over the weir should not exceed about twice the [illegible] of the liquid in the channel immediately above the weir.

5. The weir and float board should be perfectly upright, and have a true overfall and air space under both the [illegible] sheet of water, while the float of the automatic recorder should be placed sufficiently far back from the weir to avoid curvature of surface.

As to the type of recorder, I have always used a small portable Glenfield and Kennedy machine, the drum being driven by a seven-day clock, and the pen actuated by the up and down movement of the float. There are, however, several automatic height recorders on the market, some of them with pen or pencil cams cut to give the discharge direct upon the chart. It is not, however, a difficult matter for any engineer to construct a simple and reliable machine for comparatively little outlay. Care is required in adjusting the pen to zero on the chart, which should be carefully pressed down to the rim at the foot of the drum.

Most recorder pens have an up and down range of 6 in., so that the depth over the weir must be limited to about 6 in., unless the minimum early morning flow exceeds, say, 1½ in. depth over the weir, in which case the recorder can be made to register up to 7½ in. by setting the pen at zero on the chart when exactly 1½ in. of liquid is passing over the weir, the chart base line thus reading 1½ in. above sill level. The recorder should be set up perfectly level, and the float, if in an exposed situation, should be surrounded by a cylinder of fine perforated zinc, to eliminate wind action, otherwise oscillation of the float will soon exhaust the ink in the pen, besides blurring the chart. It may be mentioned that a mixture of glycerine and cochineal, or any [illegible] makes a good ink for a recorder pen.

Having erected the weir and recorder, the sample bottles should be prepared and the time for commencing settled. Assuming 9 a.m. to be the hour determined upon, and that average samples of crude sewage are to be taken, the recorder should be started at 9 a.m., and the first sample of sewage put in at 9.30 a.m., the second at 10.30 a.m., and so on hourly until 8.30 on the following morning, when the first set of twenty-four hourly samples will be complete. The filling of each bottle is usually most conveniently done at the weir sill-ledge.

It will be found convenient to write on each bottle the nature of the liquid, the date, and the hour of drawing. The cork can be [illegible] with grease chalks, upon [illegible] or a gummed label can be used.

As each hourly bottle is filled the stopper should be allowed to sink down gently into place in the bottle neck; if this is not carefully attended to there is [illegible] risk of [illegible] when an [illegible] tends rapidly to [illegible] the bottle. After [illegible] the bottles should be set up in a row in the order of the times at which they were filled. It will be found, when the twenty-four bottles are ranged in a row, that a wonderfully good idea can be obtained visually of the variations in the character of the sewage throughout the twenty-four hours.

[illegible]

A point [illegible] to the [illegible] is the [illegible] of fæces in a sample. Although they are usually omitted when taking chance samples direct with half-winchester bottles, this would appear to be a faulty method of sampling in certain cases, especially where the crude sewage subsequently undergoes treatment in septic tanks. If they are included they will need to be broken up in the hourly sample bottles before the proportionate amounts are drawn off.

After the last of the twenty-four hour samples has been taken, and the recorder pen has reached the 9 a.m. ordinate on the chart, the chart can be removed and replaced by a fresh one, and the hourly rates of flow worked out and entered up on the finished chart. The date, rainfall (if any), and other notes of interest should be recorded, such as times of weakest and times of strongest sewage, flushes of trade wastes, &c. For working out the hourly flows on recorder charts, I use a special slide rule, which has the advantage of shortening the labour considerably. In the case of a recorder provided with a cam, the discharge can, of course, be taken direct from the chart; but with a recorder that only registers the height, the heights have to be translated into discharge diagrams.

The next step is to take from each bottle, commencing with the 9.30 sample, an amount proportionate to the rate of flow for each hour, and to transfer it to the large mixing bottle. Assuming the flow for the first three hours to have been severally 500, 600, and 700 gallons per hour, then 2 ozs., 2½ ozs., and 3½ ozs. are taken from the first, second, and third bottles respectively, these amounts will be proportionate to the rates of flow for those hours, and the same procedure must be followed with the twenty-one remaining hourly samples.

The measurement of the liquid from the hourly sample bottle is best effected by means of a tall glass cylinder graduated in cubic centimetres. Before the sample bottle is unstoppered it should be turned over once or twice to mix the contents, and any large solids should, if present, be broken up with a glass rod. In many cases the hourly amounts to be taken from each bottle can be obtained by knocking off two or more figures from the right of the hourly rates of flow, and if the figures thus obtained are inconvenient, the whole of these can be either divided or multiplied by a common factor. Care should be taken that the aggregate of the figures adopted are sufficient to yield enough liquid for the final sample; and it is better, if this can be done, to take sufficient liquid to fill two half-winchesters in case of breakage of one of them.

The working out of the chart and the sub-sampling, together with the entering up in the proper hour spaces of the chart of the times of strongest and weakest sewage, presence of trade wastes, &c., take some considerable time; and while this record is in progress the reserve bottles previously mentioned will be needed to take the first few hours of the second set of samples.

When the proportionate contents of the twenty-fourth hourly sample bottle has been transferred to the mixing bottle, the whole of the contents of this large mixing bottle should be gently agitated while the half-winchester bottle or bottles are being filled from it, in order to keep the suspended solids evenly distributed throughout the liquid. After the half-winchesters are thus filled, the hourly sample bottles can be emptied, washed out with clean water, and set to drain. In cold weather, half-winchesters, or winchesters filled with sewage, tank liquor, or effluent, should be filled brimful, and the stoppers gently worked in, and tied down with a piece of calico or string; in hot weather, and also in keen frosty weather, a small air space may be left at the top of the bottle in the case of sewages or tank liquors. The samples should be despatched to the laboratory carefully packed in wicker cases or hampers, nothing being better than old crumpled newspaper for packing the bottles in. It is often useful to have a special sample of the weakest early morning sewage, taken in a half-winchester, to be examined for nitrates. These, if present, indicate the presence of subsoil water in the sewage.

It may be noted that in the case of very small sewage works, where an automatic height recorder cannot be obtained, depths over the weir can be taken with a thin steel rule, one edge of which is ground thin. Depths should be taken sufficiently far from the weir sill to avoid curvature, and it will be found that if the rule is rubbed lightly against a block of wet clay and allowed to dry before each reading, the exact depth can easily be seen at a glance. The gauging of sewage flows in this way is very tedious, since readings should be taken every ten minutes, or at even shorter intervals, should the flow of sewage fluctuate much, as will almost certainly be the case with a small sewage works. At least three observers are needed for the twenty-four hours for taking sill depths and drawing samples.

There is another method of taking average samples, in which samples are taken at regular intervals throughout the twenty-four hours, each of these samples being analysed separately, a "weighted sewage" can be obtained by multiplying each separate analysis by the rate of flow at the time the sample was taken, the results are then added up and divided by the total flow.

Some years ago the writer, having occasion to take a large number of average samples, designed an instrument for taking samples directly proportionate to the rate of flow in one operation. Briefly described, the instrument consisted of a paraboloid

copper tube or container some 12 in. long, passing from about 3 in. at the bottom to about 2½ in. at the top, the several diameters being substituted from the weight thereon. This tube was attached to a sliding metal slot working up and down in socket carried on to a rod provided with a thin sole plate upon which the tube rested when the sample was taken. When in use the rod was carried over the sewage tank (open or covered) and the sole plate placed in the sewage flowing, when set, about 1 in.—i.e., the thickness of the sole plate—below the level of the sewage. The sewage then dropped through the liquid on the sole plate, and the penetrated liquid passed out through the moving tube, a ring washer preventing its escape in the rest of the plate provided any escape of liquid while a certain slip at the head of the tube kept the contents into well home against the rubber. In this way, a sample proportionate to the flow of liquid, in other words proportionate to the height of liquid flowing over the sill. Like most automatic contrivances, however, while possessing many marked advantages with certain liquids, containing suspended matter of moderate size, it had also several drawbacks, and the larger and more bulky vertical already detailed is to be preferred in most cases.

There are numerous automatic samplers to be seen in use at several sewage works, most of them actuated by a small water-wheel driven by a flow of sewage, tank liquor, or effluent.

TANK LIQUORS AND EFFLUENTS.

The sampling of tank liquors and effluents is effected in a somewhat similar to that already described for sewage, and it is easier, because less complicated by solids; and when both sewage, tank liquor, and effluent are sampled at the same time, it is often convenient to draw what are known as "corresponding samples." By corresponding samples is meant the taking of two or more samples of the same liquid in its different stages, a certain interval of time or "lag" elapsing between the drawing of each of the said samples. For example: Assuming a sewage to be flowing at a uniform rate into a tank having a certain capacity, and that a sample of the sewage is drawn as it enters the tank, a sample of the tank liquor taken six hours later will be a sample other things being equal corresponding to the sample of sewage.

It is often necessary to use dyes, such as fluorescin or eosin in order to know the progress of a particular liquid through several processes. For example, if the temperature of a liquid entering a settling tank is much higher than that of the liquid in the body of the tank, short cuts through the tank at the surface are almost certain to occur, and a dye, such as fluorescin, shows this at once. Samples should be taken just before the dye reaches the sampling point to avoid including the dye in the sample.

Corresponding samples are also exceedingly useful in showing the relative amount of work brought about by the several stages of a purification plant, the only objection to them as the time occupied in obtaining a complete set. It may be noted that the chlorine figures on analysis will usually but not invariably, show whether the samples of sewage liquor correspond properly. This statement does not, however, as a rule, hold good in the case of sewages containing trade wastes.

EFFLUENT FROM CONTACT BEDS.

With regard to the taking of samples of effluent from contact beds, it is well known that the quality of a contact bed effluent varies considerably as the bed is being run off, being worst when the outlet valves are first opened, afterwards gradually improving until the bed is practically empty. It has also been found to be the case that samples taken at the period of mid-flow from the bed, approximate closely to the average quality of the whole of the effluent discharged, and it is therefore sufficient, in the majority of cases, to take a sample at mid-flow from each particular bed discharge, and to mix the whole of them together to make up the twenty-four hours' average sample.

Storm-water samples can be taken automatically, if desired, by fixing a vessel on the side of the storm overflow manhole at the level at which the required dilution occurs.

Care should be taken in sampling all sewage liquors that no sediment is stirred up in any channel or manhole and mixed with the sample, otherwise the sample becomes worthless. This is of especial importance in taking samples of effluent.

It is, perhaps, not generally realised how much effluents vary in composition in the course of the twenty-four hours, even in the case of land effluents, and when it has been customary to take a sample of effluent regularly at the same hour daily, it is often surprising to see the difference shown by average samples taken over the whole twenty-four hours.

TRADE WASTES.

The sampling of trade wastes must on a different footing to the sampling of sewage liquors. A thorough working knowledge of the particular trade in question is needed if the samples are to take representative samples. Trade wastes vary in character in short intervals of time, owing to the different operations which are frequently in progress at the same time at the one manufactory, as, for example, where bleaching, printing and dyeing are carried on simultaneously at the same works, as is often the case.

In the case of many trade wastes, when taking average samples it is advisable to take a sample every five or ten minutes owing to their rapidly varying character, and each separate sample should be tested with litmus for acidity or alkalinity, and the temperature noted. It is frequently desirable to take samples of each of the various liquors from a manufactory as well as of the general or mixed waste; in such circumstances, difficulties in arranging the flow are apt to arise, the contents of vats being let off with a rush in the space of a few minutes, the chart of the recorder consequently showing an abrupt vertical line which cannot be integrated for discharge. In such cases a number of dip samples may be taken, and the capacity of the vat or tank taken, and noted in pencil on the chart at the proper point.

At some manufactories with which the writer is acquainted, a variety of gauging expedients have been necessary in order to arrive at accurate information as to the volume of discharges.

Most trade-waste investigations demand a rather elaborate scheme to be laid down before satisfactory sampling can go forward, and since the analysis of many of these wastes is laborious and intricate, and consequently costly, it is very advisable that as in the case of sewage liquors, the samples shall be as far as possible representative of the liquids from which they are drawn. Many trade wastes it may be mentioned, do not, owing to their nature and colour, admit of the use of eosin or fluoresin for tracing the various liquids through their several processes.

RIVER SAMPLES.

River samples require considerable care in taking, especially where large rivers are concerned, and where bacterial samples are in question; the boat from which the sampling is done often itself carries contamination on its sides at the water line. All river samples should, wherever practicable, be cross-sectional ones, and a number of samples should be taken on a line normal to the axis of the river—and these should be mixed together for the final samples.

For the taking of surface samples in large rivers, I have found two glass tubes of ⅝ in. internal diameter wired together, and about 18 in. long, exceedingly useful. As a boat is rowed very slowly along the section line, dip samples are rapidly taken every 6 ft. or so, alternately 6 in. and 2 in. deep, and the fingers or palm of the hand closed over the top apertures of the tubes, which are then quickly emptied into a glazed earthenware pail. If corresponding samples are needed, the river water should be coloured with fluoresin when the first set of samples are taken, and practically the same body of water can then be detected and re-sampled lower down. Two or more samplers are needed for taking the second sample as quickly as possible, just before the dye reaches the cross-section. To those who have been accustomed to judge the average velocity of a river by the mid-stream surface velocity alone, the slow average rate of flow shown by the fluoresin will come as a revelation.

There are many other ways of taking special samples, such as deep-well samples, many of them requiring specially designed and expensive apparatus, but they are perhaps of special and not general interest, and for that reason they are not included in this paper. In conclusion, it may be observed that, although the procedure involved in obtaining true average samples may appear at first sight to be too refined for general use, it should be carefully borne in mind that a substantial error in the strength and character of a sewage—such as may very easily arise if a few casual samples taken at haphazard are relied upon—may be the cause of sewage purification works being constructed not competent to bring about a proper degree of purification of the sewage they are called upon to treat.

Town Planning and Amenities.*

By S. D. ADSHEAD.

[illegible] the object of those who framed the Town Planning Act [illegible] that amenity and convenience should be placed on the same footing and [illegible] It is not attempted to define here question [illegible] but to emphasise the importance of preserving amenities. Exactly what is meant by amenities it is difficult to say, but it must be assumed that it includes the provision of pleasant places to live or work in, of healthy homes, and towns interestingly laid out, so that life can be enjoyed in the fullest sort of way.

In town planning schemes under the Act and now [illegible] considerable reports, inquiries held and information on maps prepared indicate that convenience of arrangement is the main advantage that has so far been aimed at, and perhaps quite rightly. The claims of town planners have certainly been considered on this. Questions relating to the provision of amenities have no doubt in many cases been considered, but so far they have not been given the first place which they certainly merit.

Roads and transport facilities are after all, but means to an end, the end being the residents, the buildings, the open spaces and the parks. But is this all? Only in an indirect sort of way. The true end of town planning is to provide schemes that will ensure that towns will be erected in a way that will inspire the citizen, elevate his imagination, refine him, simplify his existence, and encourage him to live nobly. This, then, is the true end of town planning, to which all methods and schemes for the provision of convenience and healthiness but point the way. This is the goal to which sound town planning must constantly move. Amenity is the one asset which questions of convenience and economy must never allow to go unconsidered. But how is it to be assumed that amenity as well as convenience will actually be included in the plan. People have grown too blithe and casual in the use of words like "beauty" and "artistic," and use them so loosely and recklessly that it is an empty statement merely to say that the consideration of amenities means giving beauty to the scheme and an artistic rendering to the finish. One says that there shall be beauty in the garden suburb, that the houses are to be erected in an artistic way; but what does it all really mean? Let these terms be dropped, and others used that are more exact; let an endeavour be made to get a little near the truth. Everyone desires amenities, but it savours of effeminacy and superficiality merely to desire existence in a district described as beautiful and artistic, and one is not quite sure if beauty and nothing but beauty is wanted at every turn. What is wanted, however, is that everywhere fine character and character of the right kind shall prevail. In a search for this one is on sure ground.

Of all human interests, none surpass in attractiveness the interests of personality, closely associated with which are the attributes of character, tradition, and incident in history. Get the personal interest in all that is designed, give it correct character, let it be the outcome of tradition, and let it be the last chapter in the panorama of a great history, and beauty will take its place, real artistic results will follow, and the surroundings will be enjoyed without the necessity of calling them artistic and beautiful without complying with a commonplace idea. To give

THE DESIGN OF A TOWN

right character means that each feature and incident must look the part, a part which is the best that can be played. But let this be applied in concrete terms, this application of right character to the town.

The country road must in every sense be part of the country-side. If it is a great highway, then it must have an asphalt track. If it is a road for pedestrians, for carts and cattle, then it will not need a path. Nowhere in open country does one need kerbs, or sidewalks which look like urban tracks. People who walk out in the country are always prepared and enjoy walking on the grass. The margin and borderings must not be kept even and cut, for nothing comes nearer nature than a natural strip of grass. In a suburb the grass margin becomes a continuous park.

* Paper read at the Annual General Meeting and Conference of the Institution of Municipal and County Engineers at Cheltenham.

It is overrun by many people passing to and from town, it should be kept neatly cut, and should suggest that it is closely allied to the neatness of the town. One has to appreciate more than one is moved by the rusticity of a village green, the formality of a town garden, the grandeur of a suburban park, and the wildness of a public reserve, where primitive Nature is to be seen, perhaps enjoyed, and where complete change is to be found from the formality of the town.

But it is not only in the general design of roads and parks that the provision of right character must be ensured; it is also in their detail, in the colour of the macadam, in the thickness of the kerbstone, in the character of the foliage, in the fence, in the railings, and even in the kind of seat that is placed in the path. How frequently is the groundwork of the picture completely spoiled with red brick chippings that are sore to the eye, and cry out so loud. Or, worse, with black ash, reminding one of everything that is squalid—the excretion of an industrial age. How often does one see great granite kerbs to grass margins, sufficiently heavy to form a good edge to a dock. How often there are iron fences of spiked, rounded iron where a post and rail painted white would be all that is required.

A tall railing is a fine thing when well designed, but the ¾-in. round iron, spiked at the top and set up in bays, is fit only for temporary purposes, and as a permanent public fence is a thing absolutely to be abhorred. It has a cheap and nasty look, it smacks of economy, it is an insult to the good behaviour of the public, and, lastly, it has no place in the finest memories of park or glade. By all means, if one has to have tall railings, let them be good ones; let inspiration be sought in the fine cast-iron example which surround all the old parks; anything is better than the cheap spiked example which, unfortunately, is so frequently met.

Few features in the detail of the garden are so objectionable as a vitreous tile edging or brick-on-edge coping to grass. Unfortunately this crude method of edging grass is in very common use. No doubt it saves cutting the edges; but how hard! how unsympathetic! One does not see such crudeness in old gardens, nor even in any of our older parks. If the upkeep is so great that it costs too much to keep our turf edges cleanly cut, then they should be left like the edge of a village green. It is dangerous to make rules; a tile edge to the paths of a small Dutch garden might look well, but a vitreous enamel or brown glazed coping round the edge of a lawn is abominable.

And how often are there asphalt paths, terra-cotta vases and terracings in red stocks, ornamenting places which would be in far better character if left, say, like Hampstead Heath, or some woodland glade. Complaints about the rates are universal; why spend so much in making beautiful fields into ugly parks? But

THE WRONG SORT OF CHARACTER

is not only given to streets and parks; worse sins have been committed in allocating the different interests in a town. How often does one find the corporation works—the gasworks, power stations and corporation yard—occupying the choicest residential sites in a town; the scullery sink and stove fixed in the drawing-room bay. Here it is thought both foolish and stupid, but is hardly noticed in reference to an incident in a town. Mortlake, for example, in its evident enthusiasm for economy, has, in its innocence, committed this great crime; but Mortlake, sad to say, is not alone. It is only by fully appreciating the peculiar significance of each site and separate area, and by using it in the most natural way, that the best traits in its character can be brought out.

Or, again, why always choose for hospitals and workhouses the most valuable and attractive of sites?

> "Beggars may not be too nice in an evil day,
> But beggars have tongues and can enquire the way."

And why, if such pride be taken in wide streets and open spaces, are they filled with the litter and impedimenta of the town? How many market

[illegible] street crossings, and street [illegible] themselves characteristic only as open spaces, and as the result are completely spoiled by the erection about them of cabmen's shelters, tool sheds, ambulance stations, or by the fitting of public urinals and all sorts of abortions in the way of trolley poles and ugly lamps?

When there are open spaces, by all means let us try to preserve their open character, which is [illegible] above all others they should retain. Only the other day there appeared in an architectural journal a scheme for filling up one of London's finest thoroughfares—Whitehall—by planting down its centre an avenue of suburban trees. Of all the mistakes made in instilling wrong character into the features of a town none are in greater need of correction than those brought about by the wrong planting of trees.

The solution of many of these issues is, after all, usually found in nothing more involved than the exercise of common sense. The perception of right character and the possession of sound common sense are very closely allied.

But of all the sinners in the matter of town character study perhaps the architects are the worse. This is not an occasion to point out in detail the blackness of their crimes; but what can be more stupid than sham half-timber in the centre of a town—what more characteristic of bad taste and lack of sense than the country cottage erected in an urban district, when there is such a fine tradition of urban architecture all around? What a restless uncertainty is seen when many modern housing schemes are compared with the quiet refined architecture of many a slum. How picturesque in its architecture is the slum. One is often forced to realise that poverty is its only crime. If vulgarity and ostentation were, as architectural sins, regarded as equally criminal with poverty, how much modern architecture would fail.

Everyone appreciates

THE ENGINEER

because he is a practical man. If he were not practical he would not be depended on. Everyone relies on the opinion of the engineer, just as everyone questions the reliability of the architect and ridicules the incapability of the artist. But the modern engineer must be more than a practical man; the pride of the practical man is his undoing in the long run. As a personality he is seriously wanting, for, after all, we are creatures of imagination, and our greatest joys and finest experiences are not met on the roads and in the ruts of so-called practical schemes.

Engineers should guard against entirely concentrating their energies on increasing their rateable areas and reducing the rates. Both policies are, when regarded as the end, shortsighted and sinful. There is only one policy to be practised, and that is to increase the amenities of every acre of the town.

It may be said that such things depend entirely upon funds, but it is not so. There is a constant cry that land is too dear for the creation of parks, that it is too expensive to erect dwellings for the poor of a less height than five or six stories, that wide streets take up too much land, and so on. If a law were enacted that so much land was to be given up to parks, that no dwellings were to be over three stories in height, and that no main thoroughfares were to be less than 100 ft. in width, then the price of land would of its own accord adjust itself to the limits and conditions of its use.

The provision of amenities is not a question of funds, it is a question of brains. The new responsibilities that the Procedure Regulations of the Town Planning Act are placing upon the shoulders of the municipal engineer should stimulate his endeavour and broaden his outlook. He must not undertake more than he can chew. When engineers undertake architecture there is always a terrible collapse. Leave your architecture to the architect. Engineering, when seriously undertaken, is a much bigger thing; and, finally, let the municipal engineer remember that perhaps his greatest and grandest performance is to leave a mark of good character and sound sense, or, in other words, considered amenities all over the town.

On the presentation of the foregoing paper at the town planning conference held in connection with the annual meeting of the Institution of Municipal and County Engineers at Cheltenham,

Mr. H. E. STILGOE (Birmingham) said those who knew Prof. Adshead would know how much "fine character [illegible] devising a scheme for arterial roads not to include just those little touches of character which either made or marred a scheme. It might be that a fine road offered all facilities for traffic, but was the most boring [illegible] He proposed a vote of thanks to the author of the paper.

Mr. J. W. CORNFIELD (Great Yarmouth), seconded the vote of thanks.

Mr. A. J. PRICE (Lytham) said that Prof. Adshead had always taken the view that in town planning the architect and the engineer should work together—which he thought was quite the right thing to do. [illegible] at the utilitarian side, and could not get the money to carry out the ornamental portion as they would like to do. Near the town that he represented a very good [illegible] houses, but he had introduced into what was essentially a town street [illegible] would look very well on the Cotswolds or in a 20-acre field, but were incongruous where they were placed. He pointed out the incongruity, and he was glad to say that the architect saw his point.

Mr. J. A. BRODIE (Liverpool) [illegible] and architects needed [illegible] and he wished Prof. Adshead had slated them a bit more severely all round. He could say, if hard pressed, they could retaliate a bit. They could call attention to a number of houses which were being built in the North. But they could not blame the municipal engineer for that. He should like to bear witness to the good work Prof. Adshead was doing in educating young fellows in town planning. It was work which really needed doing, and he thought Liverpool's example in this matter might be copied by London. It was being done, he believed, by the provision of a Chair of Town Planning.

Mr. E. M. BATE (Frinton-on-Sea) said he believed that town councils needed educating, as there was a good deal of local prejudice to be encountered where architectural questions were involved.

Mr. R. H. WINTERBOTTOM (Irlam) said they had a good deal of heavy traffic in the streets which made necessary the concrete slabs which Prof. Adshead described as horrible.

Councillor LIGHTWOOD (Lytham) remarked that as soon as local rates could be lightened the town councils would be only too glad to consider the question of amenities.

Prof. ADSHEAD, in replying, remarked that as to architects not being quite so fitted for providing amenities as they represented, there were architects and architects just as there were surveyors and surveyors. The question must be taken generally. Money which was spent on so-called amenities was often not spent in the best way. He had seen beautiful fields converted into ugly parks. He would like to see bigger open spaces, and wider roads of a more solid nature. He was frightfully down on ashes, they gave such a bad character to a town. They must get rid of the bane of ashes in the North of England. When at Oldham he went through the garden suburb there, and they had a system of putting limestone chippings with some bituminous tar, and that worked down beautifully.

Waterproofing of Concrete.—All the concrete floors in the basement of the Nurses Home, South Manchester Guardians, Withington, have been treated with Pudlo to prevent rising dampness.

Sleaford Market Purchase.—There was no opposition at an inquiry [illegible] on behalf of the Local Government Board, to the urban council's proposal to borrow £2,300 for the purchase of private rights and tolls of the Sleaford Market. The council, it was stated, are paying twenty-five years' purchase on the income which Lord Bristol at present received from the lessee of the market place, which was distinct from the cattle market.

School Buildings as Hospitals.—The Board of Education, in a circular addressed to local education authorities in response to inquiries, says that in the opinion of the Director-General of the Army Medical Service no emergency has yet arisen, or is likely to arise in the near future, which requires the actual occupation or preparation of school buildings, other than those which have already been requisitioned for use as hospitals to accommodate sick, wounded, or convalescent men serving in the Army.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to the Editor, St. Bride's House, 21 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

THE MONTHLY PREMIUM.

Mr. R. G. Lewis, of Cromhall, has obtained the subscription for a copy of the present volume for June and has duly sent in the following:

"Quantities." Vol. I., by J. Bartlett (St. Bride's Press, Ltd.).

"How to Estimate," by J. T. Rea (Batsford).

"Questions on Surveying and Assisting," by G. Stephenson (Batsford).

Results, by Stephenson (Batsford).

QUESTIONS.

This week answers are invited to the following questions:

416. Concrete Floor.—Give two sections of a reinforced concrete floor for a span of 30 ft., showing the sizes and weights of the girders, and giving the necessary calculations. (K. G. F., *Buckfastleigh.*)

417. Sewer Construction.—A sewer is being constructed partly in tunnel. Describe a method of giving the levels in the heading, referring specially to the continuation of the line of levels from the surface. (Xing.)

418. Iron Curved Roof.—Show details of an iron curved roof of 40-ft. span, resting on girders and stanchions on one side, and on a 14-in. brick wall on the other. The roof is to be covered with corrugated iron. Show enlarged details at the foot of the principal rafter at each end. (K. G. F., *Buckfastleigh.*)

419. Practical Mathematics.—Explain a graphical method for solving simple simultaneous equations, and give a worked example.

420. Flow of Water.—Assuming that the lower tank B in the accompanying diagram is full of water, and that the 9-in. pipe and the sewer are 300 feet long, would it take to empty tank A if the outlet was open full bore? (A. S., *Beverley.*)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

415. Sewerage.—What conditions generally determine the adoption of either the "separate" or the "combined" system of sewerage in a town? ("Ajax.")

The "combined" system of sewerage, which is far more extensively used than the "separate" system, means that all the sewage, rain water, surface water, and, in fact, all the drainage flows to the sewers. By the "separate" system, on the other hand, is meant that in which sewage proper only is led to the sewage sewers, and surface water to pass off the surface as at present. Before studying the conditions which determine the adoption of either of these systems it is necessary to consider the respective advantages and disadvantages of the two systems. They are as follow:

(a) *Advantages of Separate System.*

(1) A saving in the quantity for treatment on wet days. There is the same amount and quality of sewage to be treated every day.

(2) In pumping scheme a similar saving in the cost of pumping.

(3) Smaller cost of outfall sewers.

(b) *Disadvantages of Separate System.*

(1) Impossibility of obtaining the absolute separation of storm water from sewage proper.

(2) Necessity for duplicate system of drains throughout the district, with consequent liability to confusion in connections.

(3) Extra cost of construction and maintenance of duplicate system of sewers.

(4) First washings from storm sewers are most impure, and quickly lead to the pollution of watercourses.

(5) Further expense is incurred by the adoption of some arrangements for flushing the sewers.

The combined system of sewerage is used in most towns, but it is somewhat difficult to treat the sewage owing to the variable amounts received from day to day. The separate system is used in several boroughs just outside London—such as Tottenham, Hornsey, &c. Where a town is situated at or near the mouth of a river, or for a seaside town, there can be no difference of opinion as to the system to be adopted, for, since the sewage can then be easily disposed of, the combined system is obviously preferable. For an inland town situated near a river, the separate system is generally used, for the surface water can be run into the river, and the sewage, after being treated, is subjected to land treatment. But the condition that has most to do with deciding which form of sewerage is used is that of the position of the town to be drained and the nature of the district. Where a town is situated inland, and away from any river or the seashore, the sewage would have to be disposed of by some method of purification. In such a case the separate system would undoubtedly be adopted, for it would be advisable to have as little sewage to treat as possible, and hence all water which is not sewage proper is kept out of the foul sewers. Again, if the town is situated partly on a hill and partly in a valley, and the outfall sewer is on the high level, thus necessitating pumping the sewage from the lower area of the town, it would be advisable to have the separate system (at least in the lower area), as by this means the amount to be pumped would be very much reduced. On the other hand, if the sewage is of a weak kind, and hence does not require much purification, it will

product to be as cheap to purify the whole of the sewage proper and storm water as to have a separate system for it. In connection with this it will be seen from the above arguments that, except under special circumstances, the combined system of sewerage would usually be adopted. (J. W. P., *Barnhill, near Nowhere.*)

The separate system, if carried out in its entirety, is a very complicated arrangement, there being two complete sets of drains and sewers, one for the storm water and one for sewage, and there is always some danger of connecting the sewage drains to the storm-water sewer, and *vice versâ*. On the question of first cost, the separate system is probably more expensive. The comparison is very difficult, however, and varies according to the district. If the district for drainage areas can be divided into a number of [illegible] at one point, thus keeping all the sewers of small size, it is just possible that the separate system might be the cheaper, but if both sets of sewers had to be conveyed some distance away from the town before they could be discharged it would most decidedly cost more than the combined system. It should also be borne in mind, in comparing the cost, that each house has to have two sets of drains, practically the same size as if only one set was installed. A point largely affecting the system of sewerage is the system of sewage disposal, as some methods of disposal are not so easily adapted to variations of flow as others. If land treatment is adopted a very large area will be required unless storm-water beds are installed; while, if it is a sea-coast town and the sewage need not be treated at all, there is no object in providing the two sets of sewers. If, as in low-lying towns, all the sewage must be pumped before it can be treated, it is evident that, from the point of view of annual cost, it is desirable to exclude as much storm water as possible. It also requires more subdividing and greater stand-by plant with the combined system to deal with the fluctuating flow, unless storage tanks are provided to take the excess that the pumps cannot dealt with. It must be pointed out, however, that even in the strictly separate system some storm water always finds its way to the sewage sewers, and allowance has to be made for this at the disposal works in any case. Also, that the first washings from the backyards and streets are quite as impure as ordinary house sewage, and if discharged into streams without treatment will probably give rise to complaints. If there is an existing system of sewerage in the district to be redrained, and it can be used for storm water, this is often a deciding factor in favour of the separate system, as the new drains to be laid may be smaller, and consequently cheaper, than if the combined system was adopted. The system of sewerage most popular is the partially separate system, in which the storm water from the road is run into storm-water sewers and discharged as is most convenient, while that from the backyards is run into the sewage sewers. (J. A. R., *Faversham.*)

CORRESPONDENCE.

Sir, though I would persuade, I'll not constrain,
Each man's opinion freely is his own
Concerning anything, or anybody.

— MASSINGER: "The Fatal Dowry," Act ii., 2.

GROUTING AND PENETRATING OF ROAD SURFACES.

To the Editor of THE SURVEYOR.

SIR,—With reference to Mr. Green's paper read at the annual meeting at Cheltenham, I am somewhat surprised to learn that Glutrin is, in the first instance, more costly than Tarmac. This may easily be accounted for in the district as not near the place of manufacture, but, generally speaking, my experience proves the contrary to be the case.

I have recently completed a length of Grit-n bound road and have prepared some statistics which, I think, may be of interest to other surveyors. I always think it is very difficult to judge the relative prices of roadways unless the costs of the various materials are stated; for instance, one surveyor may put down a length of road, and another surveyor a similar length in another district, and the cost might easily be considerably more in one case than the other, on account of heavier railway rates, wages, team labour, &c.

The road of which particulars are appended was laid on an existing water-bound main road about 1 mile from the railway station. The area covered was 2,252 sq. yds. Although the road has only been laid two months, I think its success is assured. It is practically dustless, certainly less dusty than tarred limestone, and in no single instance has a loose stone been found since the steam roller left the job.

The road is laid on the cambered system, and it should be noted that 17 sq. yds. 3 in. thick per ton of granite is obtained. This I attribute to the use of dust for mixing with the Glutrin, which goes to show that stone will cover a greater area in a Glutrin-bound road than in the water-bound system and this saving compensates somewhat for the cost of the Glutrin solution.

	£	s.	d.
200 tons 2½-in. Shap blue granite, at 10s. 6d.	105	0	0
60 tons 2½-in. limestone dust, at 3s. 9d.	11	5	0
1,000 gallons "Glutrin," at 10 4/5d.	45	0	0
12½ days' steam roller hire, at 25s.	15	12	6
5¾ days' team labour, at 8s.	21	4	0

Yours, &c.,

HARRY RIDING,
Engineer and Surveyor.

Burley-in-Wharfedale
August 15, 1914.

WILTSHIRE MAIN ROADS.

To the Editor of THE SURVEYOR.

SIR,—My attention has been called to the report of a Mr. J. E. Dockings at a meeting of the Wilts County Council, reported in the local papers of the 8th inst., indiscriminately attacking the thirteen district surveyors, and through them the ten rural district councils that repair the main roads within their districts, under contract with the county council.

Ten rural district councils are responsible for the repair and maintenance of 374 miles of main roads, varying from 15 miles in the smallest district to 64 miles in the largest district.

The county surveyor states in his annual report for the year ending March 31, 1913, the last report to hand, under the heading "Rural Districts under

[illegible] leaving his assistant in charge as a locum. I am pleased to state that there is a steady improvement in the condition of the roads in the district. In the case of this report, as a different [illegible] Mr. Deacon's words—and the county surveyor has been responsible a long time past that the expenditure on these roads was entirely inadequate, and that the supervision of the work at each pitch was a farce—I have had the oversight [illegible] in the district in the county for many years, and have always had a good report, and claim I was entitled to it.

What the future may have in store, I am prepared to prove where there is inadequate supervision [illegible] in the districts under contract.—Yours, &c.,

ONE OF THE TEN.

August 10, 1914.

THE WAR.

To the Editor of THE SURVEYOR.

SIR,—The immediate domestic problems raised by the outbreak of war are second only in importance to the tremendous issues which hang upon the epoch-making events which are taking place by land and sea even as we write. The organisation of hospitals for the reception of our soldiers and sailors who may be invalided home is happily proceeding apace under the most competent direction, and offers of material aid and personal service involving real sacrifice are pouring in. A problem of equal magnitude will inevitably arise in the very near future by reason of the distress among the poorer classes of the population, which must occur as a result, partly direct and partly indirect, of the outbreak of hostilities. The Government are fully alive to the situation, and although it would be idle to pretend that the coming weeks will not be full of anxiety, there can be no doubt that the proper spirit for those who are forced to remain inactive by reason of age, physical incapacity, or force of circumstances, is one of quiet calm and resolute determination that, as far as possible, suffering to others shall be prevented by avoiding any unnecessary dislocation in the ordinary private and business life of the community. Writing in *Punch*, Mr. Owen Seaman speaks for the vast majority of his fellow countrymen when he says:

> And we, whose burden is to watch and wait—
> High-hearted ever, strong in faith and prayer,
> We ask what offering we may consecrate,
> What humble service share?
>
> . . . . . .
>
> To go our quiet ways, subdued and sane;
> To hush all vulgar clamour of the street;
> With level calm to face alike the strain
> Of triumph or defeat."

Yours, &c.,

August 17, 1914. T. S.

To the Editor of THE SURVEYOR.

SIR,—A meeting of the council of the Institute of Sanitary Engineers was held on August 12th, when the following resolution was passed unanimously:—

"In view of the present emergency, it is agreed that the expert knowledge of the members of this institute should be placed at the disposal of the Government, and that a circular letter be sent to all members pointing out the direction in which it is thought they would be of use in this connection, and asking to what extent they would be prepared to serve their King and country."

It is felt that the special knowledge of sanitation possessed by members of this institute might be of peculiar service to their country in this grave crisis. This appeal is addressed only to men who are not serving, and who are not qualified to serve, in existing units of His Majesty's Forces. There already exists a Territorial Sanitary Corps of three companies, and recruits in these companies are urgently required.

It is thought the direction in which sanitary experts could be of most service would be in connection with water supply, drainage, sewage and refuse disposal of encampments and towns in which troops are quartered; also in temporarily discharging duties requiring knowledge of sanitary engineering in positions vacated by men who have been called away to serve their country in some other capacity.

The council think that members who are not able to volunteer for active service may be able to assist in some of the directions indicated.—Yours, &c.,

P. N. HASLUCK,
Secretary.

120 and 122 Victoria-street, S.W.
August 14, 1914.

To the Editor of THE SURVEYOR.

SIR,—The Special Fire Service Force which is to be formed by the British Fire Prevention Committee may shortly require the following for service in connection with the protection of Government establishments, &c., outside the London area and for other national purposes:

Twelve steam fire engines (with new horse drawn or motor, with or without mechanics).
Twelve manual fire engines or hose cars.
Twelve landaulette motor cars (with or without drivers).

Offers to loan the above should be addressed, with full particulars in writing, to the undersigned at 8 Waterloo-place, London, S.W.—Yours, &c.,

LONDESBOROUGH,
Lieut.-Col. Staff.

August 13, 1914.

To the Editor of THE SURVEYOR.

SIR,—I sympathise with those surveyors whose horses have been taken by the War Office, especially as it will be increasingly difficult to hire for the same reason.

Certain works of public service requiring team labour must continue to be efficiently carried out in times of war as well as peace, to prevent calamities at home. Strong representations along these lines to the officers at the time of their visit to the council yard here have so far prevented any of our horses being taken.—Yours, &c.,

PERCIVAL T. HARRISON,
Borough Engineer.

Chelmsford.
August 18, 1914.

THE WAR.

SUITABLE WORK FOR THE UNEMPLOYED.

The formation of Distress Committees throughout the country is a step in the right direction, as unquestionably we shall soon be faced with the serious question of how to provide work for the unemployed. It is our duty to be ready with schemes before the actual necessity arises, and although our readers are no doubt busily engaged in the preparation of such schemes the following hints may be of some service.—

(1) *Ordinary Road Work.*—This naturally comes first, as there is always work of this description to be done in the neighbourhood of almost every town; and although the modern systems of road construction and maintenance do not involve the employment of much unskilled labour, this class of work keeps a large number of men occupied, and no doubt many other men could be also engaged.

(2) *Road Widening and Improvement.*—This includes the widening of roads, the improvement of dangerous corners and cross-roads, the improvement of gradients, the formation of footpaths, and many other similar works on which large numbers of unskilled labour could be employed. The Road Board have evidently realised this, for they are prepared to grant no less a sum than £1,000,000 for such works if they can be shown to be reasonably necessary.

(3) *The Construction of New Roads.*—There are already a large number of new roads and by-pass roads contemplated throughout the country. These schemes could be pushed forward, and the necessary arrangements made with landowners and others so that the schemes may be ready when the necessity arises. Here, again, the Road Board are willing and anxious to assist with free grants. No doubt many far-seeing and patriotic landowners would willingly give their land for the purpose, or would agree to sell at very low rates. If they held out for exorbitant prices they would be subject to adverse public opinion.

(4) *Town Planning.*—There are several schemes which have received the consent of the Local Government Board, and others might be speedily proceeded with so as to be ready in good time. It is evident that such schemes, especially if on a large scale, would involve the construction of long lengths of roads, streets, and sewers, and other works of considerable magnitude, as some of the undertakings must necessarily include considerable excavation and filling in of the ground, a work in which large numbers of unskilled labour could usefully be employed

(5) *Laying Out Estates.*—Private owners who lay out building estates might be assisted by the local authorities in some suitable arrangement by which the roads, sewers, &c., could be constructed by the local authority with labour assisted by the unemployed.

(6) *Street Sweeping.*—Village improvement by the employment of private firms would, under the Public Health Act, 1875, or the Private Street Works Act, 1892, be [illegible] reasons, it would be possible to make use of the best of the men in work of this description, and so make room for other unskilled men elsewhere.

(7) *Street Scavenging.*—[illegible] In the year there is always a general staff employed in such work, but this could be somewhat augmented if found necessary, and there is no doubt that many of our streets and roads could be better dealt with in this manner than [illegible] to add that in times of snowfalls there is always an almost limitless scope for the employment of unskilled labour.

(8) *Refuse Destructors.*—In many places throughout this country there are large heaps of dumped house refuse. These could be removed and the material dug into the land, even if the heaps were on private property. Such a work as this would employ very large numbers of unskilled labour, and would be a [illegible] not only in removing an existing nuisance, but also in improving lands for agricultural purposes.

(9) *Sewage Disposal Works.*—Where there are no efficient sewage disposal works with tanks and bacteria beds, work might be found, where necessary, for the renewal, washing and replacement of the filtering material, or where extensions were contemplated these might be pushed forward. Where there are sewage farms or land treatment, a great deal of work might be carried out in digging, filling in, and in many useful directions. Where the land is of a stiff or clayey nature it could be greatly improved by digging in house refuse, which could thus be utilised under No. 8 of these suggestions. In many low-lying sewage farms the levels might be improved by filling in, and there is no doubt whatever that a very large amount of unskilled labour could be employed in useful work at a large number of our sewage disposal works.

(10) *Street Tree Planting.*—Although this work would not employ a very large number of unskilled men, it would find employment for some of them. If the time of year was not the right one for tree planting, the holes might be prepared and filled in ready for the proper season.

(11) *Public Park and Pleasure Grounds.*—There is often a large amount of work necessary in excavating, filling in, levelling, &c., in public parks. In some cases, artificial lakes and ponds are required. There are many other works in such places which would give employment to large bodies of unskilled labour.

(12) *Filling in Disused Pits.*—In many localities there are disused quarries, pits and depressions of various kinds. Arrangements could be made for filling these in if suitable materials could be found for the purpose. There are many cases where the owners of such pits or quarries would be only too willing to allow them to be filled in, especially if they could be converted into suitable building sites.

(13) *Stone Breaking.*—This work was at one time largely done by hand, and employed a considerable number of persons. It is specially suitable for unskilled labour, but has become unpopular for obvious reasons. However, "needs must when the devil drives," and no doubt anyone would rather break stones than starve, and it is a work that is especially useful and easy of application in time of real distress.

Turning now to more general and larger national works in which very large numbers of unskilled labour could be employed, the following are suggested:—

(14) *Derelict Canals.*—In this country there are many miles of canals which are of no use to anyone. Many of these are almost dry, or, where they have water in them, are overgrown with aquatic weeds. There are several ways in which these useless canals could be dealt with—viz., (*a*) They could be drained and remodelled so as to be made into electric power driven light railways if the route was sufficiently important for this purpose. (*b*) They could be made into ordinary roadways; (*c*) they could be filled in, and the land either used as a road or thrown into agricultural land. Such work as this would give employment to a very [illegible] number of men.

(15) *Sea Defence.*—On many of our coasts the sea is making more or less rapid inroads. The preservation of land at many of these places is a national question, and the necessary works of preservation of our shores would involve large works of varying nature in which considerable numbers of men could be employed.

(16) *Land Reclamation.*—There are a vast number of estuaries and marsh lands which could be reclaimed from the sea. The Development Commissioners have funds at their disposal for this useful work, and there are many schemes of this description which, from the nature of such work, could employ many hundreds of men.

(17) *Forestry.*—The planting of forest trees on a large scale might usefully be undertaken in various parts of the country.

(18) *Land Cultivation.*—The drainage and improvement of waste lands so as to bring them under cultivation could also be carried out.

(19) *Military Defence Work.*—It may become necessary to carry out further earthworks, &c., in many of our already fortified positions and elsewhere. Could not civil labour be largely employed in these works, and thus allow the military free scope for other duties?

The above suggestions can no doubt be supplemented by surveyors and others who have a local knowledge of the requirements of their own districts; but we have ventured to set forth the above as they may assist in indicating the lines on which works suitable for unskilled labour might usefully be employed.

LOCAL AUTHORITIES AND THE WAR.

The Metropolitan Asylums Board have decided to carry out forthwith building works to the value of nearly £200,000.

The city engineer of Bristol, Mr. L. S. McKenzie, has prepared a list of useful works which could be put in hand to relieve distress.

The sanitary inspector, Mr. Leonard Bell, having joined his regiment, the Westhampnett Rural District Council have decided to keep his place open for him.

Morpeth Town Council have agreed that families of Reservists in corporation property will not be charged rental while the Reservists are on military duty.

Marylebone Borough Council will make up the full remuneration of officers and workmen on active service, and reinstate them on their return to their former position.

At the Carlton Urban District Council the widening of Burton-road and the improvement of the recreation grounds were mentioned as relief works for the unemployed.

Sunderland Corporation have agreed that all employees called upon to do naval or military duty shall be paid the difference between their military pay and their salary.

Bermondsey Borough Council have adopted a resolution to supplement the Army and Navy pay of employees to the full amount of their wages until the end of the war.

Paddington Borough Council have resolved to supplement the Government pay of officers and employees engaged on military service by an amount equivalent to the full pay of the men concerned.

Besides the 100 families of the Liverpool health department men and of minor officials, there are dependents of about 220 police officers and 250 tramwaymen to be placed on the pay lists while the war lasts.

Cumberland County Council have adopted a resolution that in all cases where servants of the council are on active service their pay shall be made equal to their regular wages, and their positions retained for them.

It was stated at the meeting of the Wolverhampton Town Council that the situations of all the [illegible] employees who had rejoined the colours would be kept open, and that the Government separation allowance had been doubled.

No fewer than 360 men in the employment of the Tramways Committee of the Birmingham Corporation have gone to the front. A scheme of allowances for their dependents is recommended for the approval of the General Purposes Committee.

The borough surveyor of Lewisham, Mr. E. Van [illegible]

[illegible]

[illegible] public works they might have in hand. The clerk said [illegible]

[illegible] service.

The East Sussex County Council have agreed that [illegible] of any corporation employee who volunteered for service.

Wrexham Town Council have authorised the chairman [illegible] week for each child under the age of sixteen years. The question of the payments are to be further considered later.

Coventry City Council, at their meeting next week, [illegible] Council have instructed the clerk to write the different local authorities stating that, in consequence of unemployment [illegible] by the war, the committee would welcome schemes for improvements of roads in such districts as were mostly affected. The suggestion was made that the scheme for making the proposed new Mevagissey road should be revised. The estimated cost of this is £10,000.

The West Riding County Council [illegible] the measures suggested by the Local Government Board for dealing with any distress which may arise in consequence of the war. The council [illegible] list of works relating to the construction and widening of bridges, the strengthening of road surfaces, drainage works, and the improvement of road corners, which will be brought before a committee to be convened at once with the view to grants-in-aid being obtained from the Road Board.

In order to provide work for men during the coming winter the Rhyl Urban District Council have passed plans for their new amphitheatre to cost £4,000, and have instructed the surveyor, Mr. A. A. Goodall, to prepare at once a full scheme of promenade improvements, while the plans for the new pier are to be submitted to a marine expert, so that this work also can be undertaken at an early date. An intimation has been received from the Local Government Board that they will facilitate all work for which loans are required. The board also sent an intimation that they will not require to hold an inquiry as to the council's application for a loan of £620 for additions to the isolation hospital.

As a result of action by the Distress Committee, who have been considering schemes of work in the event of serious lack of employment, several proposals [illegible] and building works involving an estimated expenditure of £15,275, were submitted to a special meeting of the Willesden Urban District Council. It [illegible] Road Board, and had been impressed with the advisability of [illegible] possible moment schemes of road repair. They had [illegible] were referred to the Works Committee.

With a view of finding employment at the present [illegible] the Middlesex County Council have decided to carry out at the earliest possible date, and as far as possible by direct labour, works which together will involve an expenditure of considerably over half a million sterling. They will include the [illegible] road and the new sanatorium for tuberculous patients near Southend. It was further agreed that [illegible] put in hand. In view of the urgency of the matter, Mr. H. T. Wakelam, the county engineer, voluntarily returned from his holidays last week. All members of the staff who are called up for active service are to be paid [illegible] allowance.

The chairman of the Farnworth Urban District Council said at the council meeting recently that if the council proceeded at once with the laying out of Darley Hall estate, the time was opportune to find work for those who would be thrown out of employment by the [illegible] Mr. Lomax, had been working this and [illegible] proposed plans, which would be laid before the whole council. He thought it would be advisable to [illegible] three delegates to be appointed to interview the Local Government Board so that no delay might arise as to the sanctioning of the necessary loan. The plans included the banking up of the Crompton Lodge so as to convert it into a shallow boating lake. The council were unanimously in favour of the scheme, and it was decided to meet on the site itself.

Among the many Government departments and agencies that will be active in relieving distress by creating employment, the Road Board is destined to be conspicuous. Sir George Gibb, its chairman, has been criticised for not spending the whole of the [illegible] income on building new roads or widening and repairing old ones. He has preferred to feel his way, and the wisdom of his caution (says the *Daily Telegraph*) has not only justified itself as a matter of policy, but will prove to have been a greater national service than he could possibly have anticipated. In the difficult times that lie before us, it is a subject for congratulation that the Road Board should have to its credit a [illegible] £1,000,000. The board does not propose to depart from the main principles that have hitherto shaped its action, but it does propose to apply those principles both more extensively and more speedily. Experience has convinced it that the most pressing and universal need is the strengthening and improvement of existing road surfaces and foundations and not the construction of new thoroughfares or, in general, the enlargement of old ones. It has therefore [illegible] local authorities by grants and loans to the amount of over £2,000,000 to undertake schemes that have had to do almost wholly with the improvement of road crusts. This line of action it intends to persevere in. It is encouraging all the highway authorities to submit plans for the betterment of the roads in their areas. In this way a large amount of necessary work will be put in hand.

Mr. W. P. Butterfield, director of W. P. Butterfield, Limited, galvanising works, Shipley, has been accepted for home service with his 30-40 h.p. Humber car, to assist with the requirements for the movements of the home Forces.

Nuneaton Housing Scheme. At a meeting of Nuneaton Town Council on Wednesday the Sanitary Committee recommended the purchase of 4,000 sq. yds. of land at Stockingford, and 6,000 yds. on the Central estate, Nuneaton, for the purpose of erecting municipal houses for the working classes. It was stated that the sites would provide for about eighty houses. Two classes of houses would be built, and the rents would be fixed at such a rate that there would be no loss to the ratepayers. The report was adopted.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Birmingham T.C. (August 5th. Mr. A. W. Brightmore.)—£31,612 for works of paving in Harborne-road and High-street, Harborne; Rylandstreet and Ledsam-street, in the city, and Booth-street, Handsworth; £10,078 for the improvement of Reddings-lane, Shaftmoor-lane, Formans-road, and Westonbirt, and £5,910 for works of sewerage and surface-water drainage.—Detailed evidence with respect to the road works was given by the surveyor, and it was stated that the sewerage and surface-water drainage operations were for Hall Green, which was a rapidly developing district. It was stated that the sewerage loan should be for a term of thirty years.

Dewsbury T.C. (August 5th. Mr. Edgar Dudley).—£500 for the purchase of land for the widening of Old Westgate, and £1,300 for the acquisition of Earlsheaton Hall estate for the purpose of a public park.—It was stated that the price to be paid for the land for the proposed park was £166 per acre. The inspector, in the course of the inquiry, stated that it did not seem that the council knew what they were going to do with the house it was proposed to buy, or what land it was intended to take. There was no map or anything in writing with the vendors.

Esher and the Dittons U.D.C. (August 10th. Mr. F. H. Tuttiett.)—£580 to carry out certain sewerage works on a piece of land between Thames Ditton Railway Station and Esher-lane.—Mr. J. T. Metcalf, the clerk, said the area of the district was 5,978 acres, the population was estimated at 13,000, and the rateable value £119,971. A penny rate produced £541. The council had accepted provisionally a tender of £630 for the work, and would pay out of revenue the difference between the £580 to be borrowed and the amount of the tender.—Mr. H. C. Fread, the surveyor, who submitted plans, said the proposal was for a separate system for sewerage only, and the cost of putting in surface drains was £50. These drains and the cost of road widening, would be met out of revenue. There was no opposition.

APPLICATIONS FOR LOANS.

Aylesbury U.D.C.—£270 for the drainage of the cemetery.

Burton-on-Trent T.C. £30,000 for the duplication of the sewage rising main.

Bolton T.C.—£61,000 for working class houses and £1,000 for new streets.

Dover T.C. £500 for electrical services.

Harrogate T.C.—£1,700 for baths extension.

Lytham U.D.C. £1,280 for private street works.

St. Thomas R.D.C.—£5,500 for works of water supply.

Seaton U.D.C.—£1,050 for drainage extensions.

Swanage U.D.C. £1,000 for waste preventing and other machinery at the waterworks.

Woodford U.D.C. £1,098 for wood block paving.

Yarmouth T.C.—£1,600 for cemetery extension and the construction of a bridge, and £5,000 for paving works in connection with the pickling plots.

LOANS SANCTIONED.

Braintree R.D.C. £1,100 for the erection of cottages.

Clones U.D.C. £2,700 for sewerage works.

Frinton U.D.C.—£2,350 for the purchase of property for use as public offices and the provision of a town yard.

Gosport and Alverstoke U.D.C. £2,710 for alterations at the Hard.

Gravesend T.C.—£1,615 for street works.

Hove T.C.—£3,750 for the construction of a bridge in Sackville-road.

Littlehampton U.D.C.—£1,000 for the improvement of High-street and Terminus-road.

Runcorn R.D.C. £110 for works of sewerage.

Westhampnett R.D.C. £300 for the purchase of land (repayable in eight years) and £1,030 (repayable in sixty years) for the erection of workmen's cottages at Boxstad.

Weybridge U.D.C.—£800 for widening Byfleet-road.

TOWN PLANNING.

SEPTEMBER.

8.—**Rochdale.** (Mr. George L. Pepler) —

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important of the local works of which particulars have been received:—Buildings—Cambridge; housing and town planning—Clydebank; refuse collection and disposal—Hove; roads and materials—Bristol £17,500, Goole £20,000, Hammersmith £18,725, Littlehampton, Winchester; sewerage and sewage disposal—Ashton-under-Lyne £14,250, Swansea £44,000; water gas and electricity—Cardiff £20,000.—Particulars of other works proposed may be found on our "Local Government Board Enquiries" page.

BUILDINGS.

Alnwick U.D.C. An additional public convenience is to be provided at an estimated cost of £350.

Blackburn T.C.—A scheme has been approved for the erection of new electricity works.

Cambridge T.C. It is proposed to establish municipal baths, washing station and a lodging house for women in Station-road at an estimated cost of £4,000.

Hove T.C. The borough surveyor, Mr. H. H. Scott, has prepared the plan for a public convenience at Seaford-road, Portslade, at an estimated cost of £250.

Oxford T.C. A special committee has been appointed to consider the building by-laws "with the object of modifying them and making them less stringent, so as to reduce the cost of building cottage property."

Wallsend T.C.—The borough surveyor, Mr. G. Hollis, has received sanction to proceed with the extension of the sewage pumping station.

Westhampnett R.D.C. The clerk reports that plans for the reconstruction of the canal bridges at Birdham and Donnington have been approved by the County Bridges Committee, and would be submitted to the Westhampnett Council after they had been approved by the county authority. The cost is estimated at £1,000 each bridge.

HOUSING AND TOWN PLANNING.

Clydebank T.C. The provision of workmen's dwellings is under the consideration of the council.

Easington R.D.C.—Negotiations are in progress for the purchase of land at Shotton for the erection of cottages.

Midhurst R.D.C.—A letter has been received from the Local Government Board as to the application of the council to borrow £780 for the erection of workmen's houses at Midhurst approving generally of the proposals, subject to a satisfactory water supply being secured, and suggesting certain amendments of detail to the proposed bye-laws.

PARKS AND OPEN SPACES.

Glasgow T.C.—The question is under consideration of providing a winter garden in Kelvingrove Park at an estimated cost of £10,000.

Southgate U.D.C.—It is proposed to carry out extensive improvements at Broomfield Park including draining and levelling (estimated to cost £600), the construction of a bowling green (£525), construction of dwarf wall with iron railings (£887), construction of gravelled path (£185), and the laying out of four additional tennis courts (£240).

REFUSE COLLECTION AND DISPOSAL.

Chard T.C. The council have adopted the proposal of the borough surveyor, Mr. E. W. Heard, for an improvement of the system of refuse collection.

Chester-le-Street R.D.C.—Particulars have been submitted from other districts of the cost of taking house refuse to tip, and the inspector and clerk have received instructions to prepare a schedule showing the cost per ton in other districts, together with the estimated cost for the parishes of Pelton and Urpeth. —For scavenging purposes the Western division has been divided into two divisions, to be known as the middle and western districts, and comprising 323 and 334 houses or thereabouts respectively.

Hove T.C.—The council have adopted a report by the Sanitary Committee recommending that refuse should be collected twice a week during the summer six months, and once a week during the rest of the year, while collections all the year round should be made twice a week at the larger establishments; that application be made to the Local Government Board to borrow £5,000 to cover the estimated cost of providing three additional crushing machines; and that agreement for five years be made with Mr. C. W. Reynolds of Hove to take the whole of the crushed refuse at the rate of 4½d. per ton.

ROADS AND MATERIALS.

Bristol T.C.—The borough engineer, Mr. L. S. McKenzie, has submitted to the Sanitary Committee a list of roads in which improvements were desirable, and of other work, the total estimated cost being £17,500. The committee agreed to apply to the Road Board for a contribution towards the cost of the works.

Cheshire C.C.—Fencing and road works estimated to cost £270 are to be undertaken in connection with the reconstruction of Beeston Bridge.

Cumberland C.C.—The Highways Committee have received authority to proceed with the scheme of road improvement at Dufton and Dale Mill, at an estimated cost of £585.

Durham C.C.—The construction of a road from Ludworth to Haswell Plough at an estimated cost of £1,750 is under consideration.

East and West Molesey U.D.C.—The Local Government Board, writing with reference to the council's letter stating that they did not consider the arterial road scheme for Greater London affected the Molesey area, asked the council to reconsider the matter, and forward replies to the questions which had been asked of local authorities by the board. The chairman (Mr. J. Ray) said he thought the council ought to be extremely careful, or they would be burdened with some heavy expenditure for improvements. The council eventually decided to give the desired information, and recommended that the Bridge-road from Hampton Court Bridge to the boundary, Walton-road, and Hurst-road, be mentioned as the principal connecting roads that might be widened to advantage in the district.

East Stow R.D.C.—The surveyor, Mr. G. Harrison, has received instructions to prepare plans for making up Victoria-road.

Evesham R.D.C.—The council have accepted the offer of the county council to contribute £200 towards the cost of widening and improving the road at the waterside.

Goole U.D.C. A committee is considering a scheme for the construction of a road from Cottingham-street to a point near Thorne Colliery at an estimated cost of £20,000.

Grimsby T.C. The Road Board have promised a subsidy of £5,000 towards the Wrawby-road improvement, conditional upon the work being undertaken without delay.

Hammersmith B.C. The council have approved a scheme of road improvements, estimated to cost £18,725.

Littlehampton U.D.C.—The council are inviting tenders for 750 tons of 1¼-in. broken granite, 150 tons of ¼-in. granite chips, 250 tons of shellicks, 10,000 gallons of distilled tar, 3,000 gallons of raw tar, steam rolling, and scarifying.

Lynn T.C.—A scheme for widening the High-street is being carried out.

Northwich R.D.C.—It has been decided to make up Saddle-lane, Weston Point, at an estimated cost of £670.

Rhyl U.D.C.—An intimation has been received from the Road Board that the scheme for a new road from Rhyl to Prestatyn and Gronant, if proceeded with at once, will have the support of the board. On Friday last, as the result of a conference between this council and the other authorities concerned, it was agreed that the project be carried out, and to press upon the Prestatyn council the desirability of supporting the scheme. The estimated cost is £26,000.—The surveyor, Mr. A. A. Goodall, has received instructions to prepare a scheme at once for the laying-out

of the portion of the foreshore lying between the pier and the Marine Gardens. The scheme will utilise the sands adjacent to the promenade, but there will be ample tide-cleansed sands some 50 yds. seawards for the recreation of the children.

Sunderland T.C.—It is proposed to construct a cement footpath with granite kerb in Roker Park-road, at an estimated cost of £324.—It is proposed to pave West Back Fawcett-street with Durax stone, at an estimated cost of £423, and construct a footpath at a cost of £120.

Wilts C.C.—The council have received from the Road Board a scheme for £9,000 on account of the work now proceeding on the London Bath road.—The Roads and Bridges Committee are considering a proposal of the county surveyor, Mr. J. G. Powell, that the council should retain and supervise the whole of the main roads now repaired by contract by the rural district councils.

Winchester T.C.—The council have approved the proposal of the county council to lay wood block paving on the Winchester and Southampton main road. The county council's share of the cost will be £2,680, and the corporation's £350.

SEWERAGE AND SEWAGE DISPOSAL.

Ashton-under-Lyne T.C.—A scheme for the extension of the Plantation Farm sewage disposal works is to be carried out, at an estimated cost of £14,200.

Cockermouth R.D.C.—Consideration is being given to proposals by the Local Government Board for schemes of sewerage in Roothwaite and Broughton Moor.

Congleton R.D.C.—The new sewerage scheme for Thurlwood is to be carried out at an estimated cost of £2,134.

Foleshill R.D.C.—The surveyor, Mr. A. E. Newey, has submitted plans, which have been approved by the council, for two detritus tanks, screening chambers, and sludge lagoons, at an estimated cost of £584.

Great Ouseburn R.D.C.—The council have requested Mr. E. J. Silcock, M.INST.C.E., of Westminster and Leeds, to report upon the sewerage and sewage disposal of Acomb.

Helston T.C.—The council have instructed Mr. A. P. I. Cotterell, M.INST.C.E., of Westminster, to prepare a scheme of sewerage and sewage disposal for their existing municipal area, and for the areas about to be added to it.

Nuneaton T.C.—Proposals are under consideration for the construction of foul sewers, at an estimated cost of £2,500, and of storm-water sewers, at an estimated cost of £650.

Swansea T.C.—The council have adopted a report of Mr. Midgley Taylor for a comprehensive drainage scheme in conjunction with the borough extension, estimated to cost £344,000. The borough engineer (Mr. R. H. Wyrill) explained the difference between this and the last drainage scheme that was proposed and defeated in Parliament. The outlet is still to be at the Mumbles Head, but from 100 yds. to 150 yds. further out to sea. The storage chamber is to be increased to double the size, which will give six times the dilution of the dry-weather flow instead of three, and thus enable the sewage to be stored the whole time instead of turning it out at doubtful hours. The gradient of the sewer is to be steeper by 18 in., proposed to be done by lowering the depth at the Mumbles by 1 ft., and raising the level at Swansea to 6 in. At Brynmill there is to be a 24-in. storm-water overflow pipe extending down to low-water mark and passing under the Brynmill stream, with a syphon affixed here and also another at Blackpill. Then it is proposed to come forward with the main sewer on the old line so far as Sketty-road, whence it is to be extended so as to embrace Morriston and Llansamlet. Then it is to be brought across the river near the Duffryn works, at which point there is to be a pumping station, as the main sewer here is at a higher level. As regards the east side, a pipe is to be laid from the end of the borough boundary from the Vale of Neath Arms, where the sewage will gravitate towards a pumping station near St. Thomas, and then be pumped along Pentreguinea-road under the river into the main sewer. At Pentreguinea-street there will be a storm-water overflow as before.

Westhampnett R.D.C.—Plans have been completed for the extension of sewers at Felbam, at an estimated cost of £384.

WATER, GAS, AND ELECTRICITY.

Cardiff T.C.—A scheme has been adopted by the Waterworks Committee, subject to the approval of the Local Government Board, for the construction of a new service reservoir and filters at Heath, at an estimated cost of £20,000.

Chard T.C.—A letter has been received from the Local Government Board notifying that the period for the repayment of the loan for the water scheme would be sixty years for the loan and legal expenses, and thirty years for the sum required for works.

Colchester T.C.—It has been agreed to lay a new main from the water tower to the cattle market, at a cost of £475, and to replace enlarged mains, at an estimated cost of £1,500.

Devizes T.C.—Proposals have been made for the installation of improved plant at the gasworks.

Doncaster R.D.C.—It has been decided to open negotiations with the Doncaster Corporation with a view to a joint scheme of water supply for the whole rural area.

Grantham R.D.C.—A committee has been appointed to prepare a scheme of water supply for the village of Barrowby.

Larne R.D.C.—A scheme has been approved for an improved water supply for Glenarm.

Lathom and Burscough (Lancs) U.D.C.—Works of water supply are to be carried out, at an estimated cost of £800.

South Shields T.C.—The municipal electricity undertaking earned, during the last financial year, a nett profit of £3,522, the largest on record.

MISCELLANEOUS.

Harrogate T.C.—The question is being considered of mechanical haulage for the electricity, highways, and health departments.

Southgate U.D.C.—The surveyor, Mr. C. G. Palmer, has submitted a list of the council's workmen with a view to the adoption of a pension scheme.

THE LATE MR. W. G. KIRKALDY.

A published list of some recently proved wills includes that of the late Mr. William George Kirkaldy, 99 Southwark-street, S.E., and 25 Aberdare-gardens, N.W., civil engineer, and head of the well-known testing and experimenting firm. The deceased gentleman, son of the late David Kirkaldy, was born in Glasgow in 1862, and educated at University College School. On coming of age he entered into partnership with his father, thus forming the firm of David Kirkaldy & Son. Mr. W. G. Kirkaldy was an associate member of the Institution of Civil Engineers, and was awarded the Telford Premium for a paper on "Steel Rails" read before the institution in conjunction with the late Sir William Roberts Austen. He was also a member of the Iron and Steel Institute, the Royal Institution, the International Association for Testing Material, the Society of Arts, the Concrete Institute, and the Court of the Worshipful Company of Turners.

At the annual meeting of the Incorporated Association of Municipal and County Engineers held in London towards the end of June, 1909, Mr. Kirkaldy presented a comprehensive and carefully prepared paper entitled "Notes Regarding the Testing of Materials," which was afterwards published in THE SURVEYOR on July 30, 1909. In connection with the above-mentioned meeting of the association, a visit was paid by members to Messrs. Kirkaldy's testing and experimental works in Southwark-street. Here many important tests are carried out, dealing with a great variety of materials, such as wood, iron, steel, bronze, wires, stone, bricks, drain pipes, cement, ferro-concrete, and even sash-cords and ropes. The spacious upper floor of the works is devoted to an interesting and well-arranged museum of materials tested. Most of the tests are doubtless precautionary measures to serve as guides in the choice of material before using. Some of them, however, have been carried out to ascertain the cause of disasters that have occurred, and the museum includes among its melancholy mementoes of such disasters a portion of the ill-fated Tay Bridge and a piece of the collapsed roof of Charing Cross Railway Station.

PERSONAL.

Mr. G. Bell, borough engineer of Swansea, who has resigned, will practise as a consulting surveyor.

Mr. R. Angus has been appointed inspector of roads and streets under the Aberdeen Town Council, at a salary of £200 per annum.

Mr. J. T. Wilson, surveyor to the Oakengates Urban District Council, has sent in his resignation, and will be succeeded by Mr. V. Wilson.

Mr. G. J. Edmundson, surveyor and inspector to the Stourport Urban District Council, has had his salary advanced to £160 a year.

Mr. A. J. Price, surveyor to the Lytham Urban District Council, and Mr. Councillor Hall have been appointed to visit Southport and inspect the improvements on the Marine Drive.

Mr. Frank Stallard, M.Inst.C.E., engineer and surveyor to the Corporation of the City of Lincoln, has been granted further three months' leave of absence on account of ill health.

Mr. J. R. Sisterson, senior surveyor to the Hartley Wintney Rural District Council, having expressed a wish to retire, the Council have agreed that he shall do so at the end of the year. He has been in the service of the council for thirty-three years.

Mr. Harold Cordon, second son of Mr. R. C. Cordon, of Belper, has been appointed surveyor to the Freebridge Rural District Council, Norfolk. Mr. Cordon, jun., has hitherto assisted his father in his work as surveyor to the Belper Rural District Council.

Mr. L. D. Thompson, deputy county surveyor of Lancashire, has been appointed county surveyor of Cornwall in succession to Mr. A. E. Brookes, who is proceeding to Durham. There were sixty applicants. Mr. Thompson will receive a salary of £600, rising to £700 a year.

Mr. C. T. Chadwick, assistant borough surveyor of Maidenhead, has been unanimously appointed surveyor and public health and highways inspector to the Faringdon Rural District Council. The Maidenhead Corporation increased Mr. Chadwick's salary in June last by £10 per annum, with two further annual increases of £5 each, the third increase he has received during his service under the corporation.

SALFORD BOROUGH ENGINEERSHIP.

The Salford Corporation on Wednesday authorised the publication of advertisements inviting applications for the position of borough engineer at a salary of £2,000 per annum, rising by biennial advances of £100 to a maximum of £1,400.

Claridge's Asphalt is being used on the new laboratories of the Institute of Chemistry, Russell-square, W.C.

Important Manchester Schemes.—The Town-planning Committee of the Manchester Corporation, at a meeting on Tuesday, had before them a report by the city surveyor, Mr. L. de Courcy Meade, with respect to certain important schemes. The matter was further considered on Wednesday by the Improvement Committee by whom the report was approved. It is proposed that a new road, 8,205 yds. long and 80 ft. wide, should be constructed between Slade-lane and Cheadle and Gatley, at an estimated cost, if it is made 80 ft. wide, of £171,647. The Withington Committee approved the scheme on Wednesday, so that all the authorities concerned in the matter are agreed. The Parks Committee also propose to make lakes in three parks.

FOR OTHER ADVERTISEMENTS

See End of Paper.

RURAL DISTRICT OF BUCKLOW CHESHIRE.

The Council invite applications for the post of Working Highway Surveyor. Salary after the rate of £175 per annum, increasing by yearly advancement of £5 to a maximum of £200 per annum, with an allowance of £30 per annum for travelling expenses, such allowance being made only on the express condition that such travelling within the District in the discharge of his duties is done by means of Motor Traction—*e.g.*, motor car or motor cycle. The person appointed will be required to devote the whole of his time to the duties of the Office of Highway Surveyor of the Bucklow Rural District, which comprises 30 Contributory Places of a total area of 55,916 Statute Acres, and containing 207 miles of District Roads, and to provide a guarantee Fidelity Bond with an approved company or society in the sum of £200. He must reside, and the Council will provide an office for him, in or near Knutsford, at a cost not exceeding £15 per annum, or make an allowance to him of that sum for approved accommodation.

The appointment will be determinable by three months' notice on either side at any time.

Applicants must not exceed 35 years in age.

They must have had practical experience in connection with the making, repair and maintenance of highways and matters cognate thereto, and must be thoroughly competent to keep the necessary Books and Accounts, draw plans, prepare estimates and specifications, supervise the making of new roads and bridges, and perform all the duties of a Surveyor of Highways, and will be required to do so. Preference will be given to applicants who are now Highway Surveyors or Assistants.

Applications, marked "Highway Surveyor," must be in the candidate's own handwriting, must state age and full particulars of qualifications and experience, accompanied by copies of not more than three testimonials of recent date, and must reach me not later than morning's post on Wednesday, the 2nd September, 1914.

Any candidates selected to appear before the Council on the 16th September will be communicated with prior to that date.

Canvassing will disqualify candidates, though it is permissible to send particulars of application and copy of testimonials to each Member of the Council.

GEORGE LEIGH,
Clerk to the Bucklow Rural District Council.

Union Offices, Knutsford.
August 19, 1914.

N.B.—The Council have a Consulting Surveyor.

(1,865)

BOROUGH OF MAIDENHEAD.
SURVEYOR'S ASSISTANT.

Applications are invited for the position of Assistant in the Borough Surveyor's Office at a salary of £80 per annum, rising by £5 per annum to £100 per annum.

Candidates must have received a thorough training in a Municipal Office, and be experienced in the general routine of a Borough Surveyor's Department.

They must be competent to keep the Wages Books, Stores and other Accounts, and should have a fair knowledge of Surveying, Levelling, and Building Construction.

Applications, in candidate's own handwriting, together with copies of not more than three recent testimonials, and endorsed "Surveyor's Assistant," should be delivered to the undersigned by 4 p.m. on Wednesday, the 2nd September, 1914.

H. E. DAVIES,
Town Clerk.

Guildhall, Maidenhead.
August 19, 1914. (1,866)

FARINGDON RURAL DISTRICT COUNCIL.
PARISH OF LONGWORTH.
WORKS OF SEWERAGE.

Tenders are invited for Supplying and Laying about 700 yds. of 9-in. Glazed Stoneware Socket-pipe Sewer, at Longworth.

Specifications, Plans and particulars may be seen, by appointment, at my Office, London-street, Faringdon, Berks. Sealed Tenders, endorsed "Sewer," must reach the office of Alan G. Haines, Esq., Clerk to the Council, Faringdon, Berks, not later than the first post Tuesday, 8th September, 1914.

The Council do not bind themselves to accept the lowest or any Tender.

H. GLYNN WARNE,
Engineer.

Faringdon, Berks.
August 19, 1914 (1,867)

INSTITUTION OF MECHANICAL ENGINEERS.

PARIS MEETING.

[illegible] during the continuance of the meeting. In addition [illegible] of the society. After the reading and discussion of [illegible] the works of MM. Darracq & Cie., Suresnes; the Etablissements Baudet & Donon, Argenteuil; MM. Brown Boveri & Alioth, Le Bourget, and to the Conservatoire National des Arts et Métiers. The evening of the same day was allotted to the institution dinner at the Hotel Continental.

On Wednesday the reading of papers was commenced, and in the course of the afternoon visits were paid to the works of MM. J. & A. Niclausse, Paris, the works of MM. Hotchkiss & Cie, and of the Société Anonyme des Etablissements Delaunay Belleville, both at St. Denis, as well as to the works of the Société Generale de Constructions Mecaniques, and the Fon[illegible] both at La Courneuve. [illegible] sazione at the Société by invitation of the president, Mr. Henry Gall, Mrs. Gall, and the council of the society.

Members had a holiday from papers on Thursday, but many of them availed themselves of invitations to visit works in Paris and the neighbourhood. The afternoon was occupied by a reception in the Bois de [illegible] by Mr. William Hanning, M.I.Mech.E., President of the British Chamber of Commerce, and Mrs. Hanning, after which some members departed for an excursion to Valenciennes and others to Lille. At Valenciennes the following establishments were visited: The works of the Société de Construction de Locomotives de Blanc-Miserou, the Ateliers de Construction du Nord de la France, and the works of the Société Francaise de Constructions Mecaniques (Anciens Etablissements Cail). At Lille the following places of interest were visited: The works of the Compagnie Francaise Thomson-Houston, the locomotive and general engineering works of the Compagnie de Fives-Lille, the Roubaix and Tourcoing Multiple Filtration Plant, the Ecole Nationale des Arts Industriels, Roubaix, and various industrial establishments. The visits to Valenciennes and Lille occupied the whole of Friday, and terminated the official programme of the meeting.

Most of the papers read at the meeting were on subjects not appealing specially to municipal and county engineers, but two of them deserve more than passing mention in our columns. The first was on the

BALANCING OF INTERNAL COMBUSTION ENGINES,

by Mr. H. F. Fullagar, of Newcastle-on-Tyne, and communicated by Mr. William Hanning, of Paris.

The problem of balancing internal combustion engines is of considerable interest to those of our readers who may have to instal prime movers of this class in buildings for electric light and power pumping and other purposes. As a general rule the noise and vibration caused by internal combustion engines is inversely proportional to the degree in which the condition of perfect balance has been attained, and it is worthy of note that the balancing of such engines is much more difficult than the corresponding operation in connection with steam engines. In cases where the single-acting cylinder and trunk piston are adopted the crank angles are wider than with steam, and if several cylinders are employed vibration is caused by the greater length and flexibility of the crank case or framing. A further difficulty is due to the sudden and violent increase of pressure when the charge is fired by a spark, while firing by high compression gives rise to a severe reversal of torque in the crankshaft, and at the same time reversal of side thrust between the piston or crosshead and its guide.

After discussing the inertia forces to be balanced, and describing various types of engine more or less efficiently fulfilling the required conditions, the author drew the conclusion that the only type of engine construction in common use wherein balance of mass is completely, or almost completely, secured by the neutralisation among themselves of the inertia forces are the rotating engine, the engine with five and with six cylinders in line, and the four-cylinder two-stroke engine with cranks at right-angles one to another. Balance of mass alone is insufficient, however, because it does not counteract the violent fluctuation of pressure in the cylinders, and the resulting strains in the crankshaft and the engine frame. Therefore, to secure freedom from vibration it is necessary to arrange the cylinders in relation to the crankshaft in such manner that strains in the framing are either eliminated or so balance each other as to obviate the tendency to shift the centre of gravity of the engine relatively to its crankshaft and point of support. The author then described the Fullagar engine, which was stated to represent perfect balance of primary and secondary mass forces, balance of impulse, balance of torque, and balance of gyrostatic action.

The second paper was one on

IMPROVEMENTS IN MOTOR LORRIES,

by M. Eugene Brillié, of MM. Schneider & Cie, communicated by M. Peloux, of Paris, and taken as read.

The chief points of interest to our readers are those connected with a self-loading type of heavy lorry designed for the transport of materials which, in the first place, are stacked or deposited upon a detachable trolley, hauled up a tilting truck at the tail end of the lorry, and so brought into position on the chassis, the work of hauling being performed by means of a capstan worked by the motor of the lorry. Unloading can be effected rapidly by reversing the operations mentioned, and it is claimed that lorries of this type enable a great deal of time to be saved. Two men are necessary for loading and unloading—one to drive the motor and the other to attend to the manipulation of the trolley and auxiliaries.

Among the numerous visits arranged, those to which attention is directed in the following notes were of particular interest to municipal engineers.

CONSERVATOIRE NATIONALE DES ARTS ET MÉTIERS.

This important institution was established in 1794 for the collection of machines, models, drawings, books and documents relating to all arts and industries practised in France.

In addition to the collection of objects in the "Musee Industriel," as the first established part of the Conservatoire is now designated, public lectures were instituted in 1819 on science applied to industry, and the number of professors has been constantly increased, twenty-three series of evening lectures being delivered regularly during the winter season.

Several laboratories are included in the Conservatoire, where important work is done, a notable instance being the construction of metric standards for the countries using the metric system of weights and measures. The testing laboratory forms an annexe of the Conservatoire, and was founded in 1900. In it tests are made for the public on metals, building and other materials, fuels, oils and physical instruments. Electrical equipment is tested in a special laboratory.

COMPAGNIE ELECTRO-MECANIQUE WORKS.

The productions of these works are mainly devoted to the requirements of electric power stations. Since 1902 attention has been devoted to the manufacture of Parsons' steam turbines for driving dynamos. A most interesting installation at the works is the testing apparatus for steam turbines. The company pay great attention to the comfort of their workpeople; baths with hot and cold water are provided, as well as a well-appointed canteen with dining halls. There are also extensive gardens, divided up for the use of the workmen.

SOCIÉTÉ GÉNÉRALE DE CONSTRUCTIONS MÉCANIQUES.

The works of this company are well worth a visit, as will be gathered from the statement that the pro-

[illegible] Corliss engines, fitted with Lentz valves, [illegible] engines, Riedler steam turbines, centrifugal pumps, ventilating and air compressors, single and double acting pumps up to 2,000 horse power, Gobbett-Dowd engines, and refrigerating machinery.

THE CREPELLE ENGINE WORKS, LILLE.

Founded in 1848, the firm of Jean Crepelle & Co. claim to have been the first to introduce the Corliss engine into France. One of the largest installations of the Worthington pumps operated by Corliss engines made by this firm is used for lifting and discharging into the sea the sewage waters of Rotterdam, the instalation having the high output of 240,000 cubic metres per day of twenty-four hours. The firm have recently completed for Paris a set of three pumps designed to lift 30 cubic feet per second to a height of 295 ft.

LOMME-LES-LILLE POWER STATION.

The station, belonging to the Societe Lilloise d'Eclairage Electrique, is equipped with forty-two [illegible] steam boilers, capable of evaporating a total of nearly 500,000 lb. of water per hour, a figure giving some idea of the extensive nature of the power station which [illegible] to municipal electrical engineers.

ROUBAIX AND TOURCOING FILTRATION PLANT.

The towns of Roubaix and Tourcoing have a double supply of water, that for drinking being obtained from springs in the neighbourhood of Dennl. Water for industrial purposes is obtained from the river Lys, where it forms the frontier between France and Belgium.

Owing to the fact that refuse from flax is thrown into the river at certain seasons of the year, the water is rendered absolutely black, and exceedingly offensive. For the purification of this water, the Puech-Chabal system of multiple filtration has been adopted, the plant being at Roncq, about 4 miles from the intake at Bousbecque. As the installation is intended simply for clarification, sand filters have not been included. The apparatus consists of three series of degroisseurs and prefilters, and has a total capacity of 40,000 cubic metres (8,800,000 gallons) per day of twenty-four hours. Before entering the first series of degroisseurs, the water passes through a coagulating basin with a capacity of 1,000 cubic metres (220,000 gallons). The coagulant is furnished by a pump drawing from a mixing tank, but in practice it is only found necessary to employ chemicals on rare occasions.

The first and second series of degroisseurs are divided into four compartments each, and the third series into eight compartments. The total effective area of the sixteen basins is 1,520 square metres (16,355 sq. ft.). All of them are fitted with apparatus for cleaning the gravel by air, as adopted at the Bamford works of the Derwent Valley Water Board. Each basin is divided into four sections for cleaning purposes, and air is applied to two sections at a time, one man managing the apparatus without difficulty.

The mud removed by the degroisseurs is absolutely black, samples of the water taken from each series clearly showing the progressive improvement in the character of the water. The guarantees given by the contractor provide that the water shall be rendered sufficiently clear to enable a printed newspaper to be read through a column of water two metres long; but, in addition to the two-metre tubes, five-metre tubes are also provided, through which it is possible to read the large print in the heading of an ordinary newspaper, whereas with the raw water it is impossible to see any light through a column only one metre long.

The prefilters are eight in number, with a total area of 3,700 square meters (39,812 sq. ft.), each filter being subdivided into four sections, so that cleaning shall not require more than one-thirty-second of the installation to be thrown out of action at a time. Cleaning is effected by a suction dredger on the Boistel system. Only one man is employed to look after the prefilters, including the working of the Boistel apparatus.

As the water is required for industrial purposes only, no bacteriological or chemical tests are made, but simply the physical test for transparency. The apparatus has been working for about eighteen months with entirely satisfactory results.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. J. S. PICKERING, M.INST C.E., Borough Surveyor and Water Engineer, Cheltenham.

CLEETHORPES MEETING.

A meeting of the institution will be held at Cleethorpes on September 19th.

SCARBOROUGH MEETING.

A meeting of the institution in the North-Eastern District will take place on Saturday, September 26th, at Scarborough.

J. W. DUDLEY ROBINSON, B.SC.(LOND.),
Secretary.

92 Victoria-street,
Westminster, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

President Mr. HORACE BOOT, M.I.E.E., M.I.MECH.E.

Meetings will be held at Sunderland on Saturday, October 10th, Newcastle on Saturday, November 7th, and Newcastle on Saturday, December 12th.

A Northern District meeting, in combination with Yorkshire, will be held at Harrogate on Saturday, September 12th.

B. WYAND,
39 Victoria-street, S.W. *Secretary.*

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

HEAD INSPECTOR OF ROADS. August 22nd. Glamorgan County Council. £200—£250 per annum.—Mr. Geo. A. Phillips, county surveyor, County Hall, Cardiff.

SURVEYOR AND INSPECTOR.—August 22nd.—Fowey Town Council. £120—£150 per annum.—Mr. W. J. Graham, deputy town clerk.

ARCHITECT'S CLERK.—August 22nd.—Felling-on-Tyne Urban District Council (Education Committee).—Mr. R. Hall, clerk.

SURVEYOR AND INSPECTOR.—August 24th.—Mere (Wilts) Rural District Council. £150 per annum.—Mr. R. H. Hiscott, clerk, Council House, Mere.

SANITARY INSPECTOR. — August 24th. — Kent County Council. £120 per annum.—Dr. A. Greenwood, county medical officer, Sessions House, Maidstone.

PIPE LAYER, FITTER, AND WATERWORKS INSPECTOR. — August 25th. — Bishop's Stortford Urban District Council. 30s. per week.—Mr. Robert S. Scott, engineer and surveyor.

ASSISTANT ROAD SUPERINTENDENT.—August 25th.—Willesden Urban District Council. 3½ guineas per week.—Mr. O. Claude Robson, engineer, Municipal Offices, Dyne-road, Kilburn, N.W.

INSPECTOR OF NUISANCES.—August 25th.—Milnrow Urban District Council. £90 — £100 per annum.—Mr. R. R. Jones, clerk.

SANITARY INSPECTOR.—August 25th.—Lewis district of the county of Ross and Cromarty. £160 per annum. with expenses.—Mr. H. Miller, district clerk, Stornoway.

DRAUGHTSMAN.—August 26th.—For South Australian Government railways. £250 per annum.—Mr. J. B. Whiting, acting agent-general, 85 Gracechurch-street, London, E.C.

TEMPORARY SURVEYOR'S ASSISTANT.—August 27th.—Isle of Thanet Rural District Council. £2 2s. per week.—Mr. Chas. Taylor, clerk, Board Room, Minster, near Margate.

GENERAL FOREMAN.—August 27th.—Corporation of Wokingham. 37s. 6d. per week.—Mr. C. W. Marks, borough engineer and surveyor.

CLERK OF WORKS.—August 27th.—Fleet (Hants) Urban District Council. £4 4s. per week.—Mr. W. H. Wright, clerk.

CLERK OF WORKS. August 29th.—Corporation of Walsall. £4 per week. Mr. H. Lee, town clerk.

SURVEYOR'S ASSISTANT. August 25th.—Uxbridge Rural District Council. £2 per week. Mr. C. W. Berridge, clerk, 58 High-street, Uxbridge.

CLERK OF WORKS.—Langport Rural District Council. £2 2s. to £3 3s. per week, according to experience and suitability. Mr. J. Matheson, Langport.

HIGHWAY SURVEYOR.—Boston Rural District Council. £140 per annum.—Mr. H. Snaith, clerk, 10 New-street, Boston.

FOREMAN OF WORKS.—For Nigeria. £250—£300, and allowances. Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

TEMPORARY CLERK.—Somerset County Council. £80 per annum.—County Surveyor, Wells.

MUNICIPAL COMPETITIONS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

LIVERPOOL.—September 1st.—Laying out an estate, for the Parks and Gardens Committee. Premiums, 100 guineas, 50 guineas, and 25 guineas.—Town Clerk.

BATLEY.—September 1st.—Designs for a proposed school at Healey, for the Education Committee. From architects resident or practising in Batley.—The Clerk.

GATESHEAD.—September 10th.—Designs for a school for 700 scholars, for the Education Committee.—The Clerk.

GLASGOW.—September 18th.—Plans for buildings proposed to be erected at the north-west corner of Trongate and High-street. Premiums, £50, £30, and £25.—Mr. J. Lindsay, town clerk.

ST. HELENS.—October 31st.—Drawings of police buildings and fire station, for the St. Helens Corporation. Premiums, £100, £50, and £25.—Mr. A. W. Bradley, borough engineer.

TOTTENHAM.—Designs for a school for 900 scholars, for the Education Committee.—The Clerk.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

EASTRY.—August 24th.—For the erection of six cottages, for the rural district council.—Messrs. Jennings & Gray, 4 St. Margaret's-street, Canterbury.

RATHDRUM.—August 24th.—For the erection of forty-six cottages, for the rural district council.—Mr. P. W. Sheehan, clerk.

MANCHESTER.—August 24th.—For the erection of manager's house at sewage works, for the corporation.—City Architect, Town Hall.

TREDEGAR.—August 24th.—For the erection of a fire station at Harcourt-terrace, Tredegar, for the urban district council.—Mr. W. Edgar Jones, architect, 1 Commercial-street, Tredegar.

ST. AUSTELL.—August 25th.—For the erection of thirty-two workmen's dwellings, for the rural district council.—Mr. W. H. Moffat, surveyor.

LANCASHIRE.—August 25th.—For the erection of a school, for the Education Committee.—Mr. H. Littler, architect, 16 Ribblesdale-place, Preston.

BIRMINGHAM.—August 25th—September 15th.—For the erection of a school, for the Education Committee.—Mr. J. A. Palmer, secretary, Education Office, Margaret-street.

GLAMORGAN.—August 26th.—For alterations and additions to schools, for the county council.—County Hall, Cardiff.

ABERTILLERY.—August 26th.—For alterations and extensions to a school, for the Education Committee.—Mr. W. H. Hiley, architect, Chapel-street, Abertillery.

HUDDERSFIELD.—August 27th.—For the conversion of police stations into dwellings, for the corporation.—Mr. K. T. Campbell, borough engineer and surveyor, 1 Peel-street.

BRIGHTON.—August 27th.—For the erection of a clock tower in Queen's Park, for the corporation.—Borough Surveyor.

GWYRFAI.—August 28th.—For the erection of thirty-six workmen's dwellings, for the rural district council.—Mr. J. W. Thomas, surveyor, 22 Castle-square, Carnarvon.

ESSEX.—August 31st.—For the erection of a handicraft centre, for the Education Committee.—Mr. G. Topham Forrest, county architect, 73 Duke-street, Chelmsford.

ESSEX.—August 31st.—For the erection of a new bridge over the river Blackwater, in the parish of Langford, in ferro-concrete (on the Hennebique system), for the county council.—Mr. Percy J. Sheldon, county surveyor, Chelmsford.

LEICESTER.—September 1st.—For the erection of classrooms and additions, for the corporation.—Borough Engineer.

CANNOCK.—September 1st.—For the erection of a school, for the urban district council.—Messrs. Bailey & Solon, architects, Bridge-street, Walsall.

KEIGHLEY.—September 2nd.—For the erection of boundary walls, shelter, and railings, for the corporation.—Borough Engineer.

NORTH RIDING.—September 4th.—For the erection of a school, for the Education Committee.—Mr. J. C. Wrigley, secretary, Education Offices, Northallerton.

SHEERNESS.—September 7th.—For the demolition of engine-house and the construction of a new building and other works, for the urban district council.—Mr. F. W. S. Stanton, engineer, 3 Victoria-street, Westminster, S.W.

ILFORD.—September 8th.—For the erection of workshops at the electricity works, for the urban district council.—Mr. H. Shaw, engineer and surveyor.

ILFORD.—September 8th.—For the erection of refuse destructor buildings, for the urban district council.—Mr. H. Shaw, engineer and surveyor.

FARNWORTH.—September 12th.—For the erection of a school, for the Education Committee.—Mr. H. Littler, county architect, 16 Ribblesdale-place, Preston.

BRADFORD.—September 16th.—For the erection of eight workmen's dwellings, for the corporation.—Mr. F. Stevens, town clerk.

Iron and Steel.

MANCHESTER.—August 25th.—For the supply of cast-iron pipes for heating purposes, for the Tramways Committee.—Mr. J. M. McElroy, general manager, Corporation Tramways, 55 Piccadilly, Manchester.

KEIGHLEY.—September 5th.—For the supply of cylinders for reservoir works, for the corporation.—Mr. M. R. Barrett, engineer, Town Hall.

Roads.

ALDERLEY EDGE.—August 22nd.—For the supply of 400 tons of tar-macadam, for the urban district council.—Mr. Walter Cobbett, clerk.

WIGAN.—August 24th.—For the supply of granite cubes and setts and tramway rails, for the corporation.—Mr. A. T. Gooseman, borough engineer.

HALIFAX.—August 24th.—For grouting with pitch or other approved material 30,000 super. yds. of granite macadam, for the corporation.—Mr. J. Lord, borough engineer.

EPSOM.—August 24th.—For the supply of road materials, for the rural district council.—Mr. T. E. Ware, surveyor, Waterloo-road, Epsom.

BARNET.—August 24th.—For providing and laying tar-macadam, for the urban district council.—Mr. W. B. Chancellor, engineer and surveyor.

RUNCORN.—August 25th.—For the supply of 1,000 tons of broken stone and road metalling, for the urban district council.—Mr. James Wilding, surveyor.

WEST HARTLEPOOL.—August 25th.—For making up certain streets, for the corporation.—Mr. Nelson F. Dennis, borough engineer and surveyor.

SWANSEA.—August 25th.—For the execution of private street works, for the corporation.—Mr. George Bell, borough surveyor.

CASTLEFORD.—August 26th.—For works of street [illegible] Mr. W. [illegible]

WILLESDEN.—August [illegible] Mr. [illegible] Municipal [illegible] Dyne-road, Kilburn.

WALLASEY.—August [illegible] Messrs. Austine & Paterson, [illegible] Buildings, Newcastle-on-Tyne.

ABERCYNON.—August 29th.—For [illegible] Mr. W. T. Macindor, town clerk.

SHEFFIELD.—August 29th.—For [illegible] —Mr. A. Wilson, surveyor, West-street.

HERSTAL.—August 31st.—For [illegible] stone, surveyor.

CARMARTHEN.—August 31st.—For [illegible] G. Henry, county surveyor, Shire Hall, Llandilo.

DOVER.—August 31st.—September 1st.—For [illegible] and Ornamental [illegible] Mr. E. E. Lyndon-Stanford.

SOUTH MIMMS.—September 1st.—For the supply of Leicestershire or other granite, chippings, double-screened hogein, single-screened hoggin, and 6,000 gallons of distilled tar, for the rural district council.—Mr. G. Sincox, surveyor, "Bearwood," Great North-road, Potter's Bar.

WALLASEY.—September 1st.—For the supply of a 12-ton compound steam roller, for the corporation.—Borough Engineer and Surveyor, 18 Falkland-road, [illegible] Water-[illegible].

EASINGTON.—September 1st.—For making up and paving certain private streets, for the rural district council.—Mr. G. Waterhouse, surveyor.

FRIERN BARNET.—September 3rd.—For kerbing [illegible] up Alexandra-road [illegible] and the eastern portion of Athenæum-road, Whetstone, N., for the urban district council.—Mr. E. J. Reynolds, engineer and surveyor, Council Offices, The Priory, Friern Barnet, N.

RUISLIP-NORTHWOOD.—September 5th.—For making up a private street.—The Surveyor, Northwood.

STAINES.—September 5th.—For road works in connection with the construction of the Metropolitan Water Board reservoirs, for the rural district council.—Mr. G. W. Manning, surveyor, London-road, Ashford, Middlesex.

LLANDUDNO.—September 7th.—For work of road construction, for the Joint Committee.—Mr. W. T. Ward, engineer, Town Hall, Llandudno.

SUNBURY.—September 7th.—For the reconstruction of two roads, for the urban district council.—Mr. H. F. Coales, engineer, Council Offices, Sunbury-on-Thames.

SOUTHAMPTON.—September 7th.—For the execution of private street works, for the corporation.—Borough Engineer.

ITCHEN.—September 7th.—For executing works in certain roads, for the urban district council.—Mr. T. A. Collingwood, surveyor.

BRIGHTON.—September 8th.—For the supply of dressed kerb and channel, for the corporation.—Borough Surveyor.

CLUTTON.—September 8th.—For steam rolling and scarifying, for the rural district council.—Mr. J. S. Drury, clerk, Temple Cloud, Bristol.

TODMORDEN.—For paving several streets, for the corporation.—Borough Surveyor.

Sanitary.

TENDRING.—August 24th.—For works of scavenging, for the rural district council.—Mr. A. J. H. Ward, clerk, 42 Church-street, Harwich.

KIRKBY-IN-ASHFIELD.—August 24th.—For work of sewerage, for the urban district council.—Mr. W. Dodsley, surveyor, Urban-road, Kirkby-in-Ashfield.

ROTHERHAM.—August 24th.—For laying stoneware pipe sewer, for the rural district council.—Mr. B. Hey, engineer, Imperial Buildings, Rotherham.

CHORLEY.—August 24th.—For the construction of a sewer and manholes, for the rural district council.—Mr. A. Jolly, surveyor.

MARGAM.—August 25th.—For [illegible] for the urban district council.—Mr. D. E. Jones, clerk, [illegible]

CUTTLEBAUT.—August 28th.—For [illegible] Mr. [illegible]

SWANSEA.—August 29th.—For [illegible] surface-water drainage, for the rural district council. Mr. G. Powell Thomas, surveyor, Station-road, Floresttach.

ORPINGTON.—September 1st.—For the provision and laying of about 8,060 lin. yds. of cast-iron and stoneware pipe sewers, manholes, and storm-water chambers; also alterations to screening chamber, and tanks, and the construction of sedimentation tanks, percolating filters, humus tanks, sludge beds, channels, and diversion of stream course, for the urban district council.—Mr. L. Kenyon, engineer, Council Offices.

HEXHAM.—September 5th.—For the execution of [illegible] the rural district council.—Messrs. D. Balfour & Son, 3 St. Nicholas-buildings, Newcastle-on-Tyne.

ST. ALBANS.—September 5th.—For works of sewerage, consisting of pipe sewers, manholes, flushing apparatus, gullies, and connections, for the corporation.—Mr. H. Humphreys, engineer, 28 Victoria-street, Westminster, London, S.W.

ITCHEN.—September 7th.—For [illegible] water drainage, for the urban district council.—Mr. T. A. Collingwood, surveyor, Woolston.

RHYMNEY VALLEY.—September 9th.—For the construction of main outfall sewer, about 10 miles long, for the Sewerage Board.—Messrs. Wilcox & Raikes, 9 Victoria-street, Westminster, and Mr. T. J. Thomas, 36 High-street, Bargoed, Glam.

ALEXANDRIA.—December 8th.—For the construction of a sewerage system, for the municipality.—"M. le Président de la Commission Municipale d'Alexandrie," Alexandria.

Stores.

BRADFORD.—August 31st.—For the supply of [illegible] meters, pipes, castings, wrought-iron steam tubing, iron, steel, charging shovels, oxide wiskets, weed brooms, cotton waste, engine oil, cylinder oil, brass main gas cocks, lime, copper lamps, iron lamps, and sheet glass and opal glass for street lamps, for the corporation.—Mr. F. Stevens, town clerk.

ROCHESTER.—September 1st.—For the supply of tools, horse hire, forage, Portland cement, brooms, oils, paving materials, road metal, and coal, for the corporation.—Mr. William Banks, city surveyor.

Miscellaneous.

CHEPPING WYCOMBE.—August 24th.—For a two-cell refuse destructor, with water-tube boilers, for the corporation.—Mr. T. J. Rushbrooke, borough surveyor and engineer, High Wycombe.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted. † Recommended for acceptance.
‡ Provisionally accepted.

BROMLEY.—For the supply of 3,500 cub. yds. of broken stone, for the corporation. Mr. S. Hawkins, borough engineer:—

	Per cub. yd. s. d.
British Macadams, Limited, London (Penmaenmawr)	18 3
Brooke's, Limited, London (Guernsey)	18 0
W. Griffiths & Co., London	17 9
J. Mowlem & Co., London	17 6
A. & F. Manuelle, London	17 5
Fry Brothers, Greenwich	17 3
F. Hodson & Son, Nottingham (Leicester)	16 6

BROMLEY (Kent).—For the erection of a shelter at Whitehall recreation ground, for the corporation. Mr. S. Hawkins, borough engineer:—

Hill & Gurr, Bromley, Kent	£147
W. S. Graty, Bromley, Kent	128
Treasure Brothers, Orpington*	118

BLYTH.—For the erection of stores and workshops, for the urban district council.—Mr. R. Grieves, surveyor:—

Cook Brothers, Blyth	£1,219
Robson & Waddle, Blyth	1,100
Hedley & Sons, Blyth	1,081
R. Baxter, Blyth*	1,045

GOSFORTH.—For the construction of a flagged footway, for the urban district council.—Mr. G. Nelson, surveyor.

G. E. Simpson, Newcastle-on-Tyne	£432
J. W. Henderson, Gosforth	364
W. Tulip, Gosforth	341

LITTLEHAMPTON.—Accepted for the erection of a public lavatory, for the urban district council.—Mr. H. Howard, surveyor:—

G. E. Hayward, Littlehampton, £34.

POCHDALE.—For making up certain streets, for the corporation.—Mr. S. S. Platt, borough surveyor.

R. Lomax, Eccles.

PADCASTER.—For the construction of about 160 yds. of twin sewer, with manholes, for the rural district council.—Mr. H. M. Driver, surveyor:—

A. Wilson, Woodlesford, £80.

WEST SUSSEX.—For the erection of a school at Horsham, for the Joint Education Committee.—Mr. Hadyn P. Roberts, education architect, Worthing.

Cropley Brothers, Limited, Epsom	£6,944
H. Caudell & Sons, Horsham	6,890
J. Backus & Sons, Brighton	6,408
Crosby & Co., Limited, Farnham	6,275
Reeves & Port, Rudgwick	6,260
J. Longley & Co., Crawley	6,248
A. Crane, Worthing	6,231
A. Pescett & Co., Crawley	6,195
Murrell Brothers, Horsham	6,104
Rowland Brothers, Horsham	6,099
W. Willett, Shoreham-by-Sea	6,079
R. Cook & Sons, Crawley	5,995
F. Sandell & Sons, Worthing	5,900
W. F. Sendall & Co., Horsham	5,677
H. Baker & Son, Horsham	5,625
G. Potter, Horsham (revised tender)	5,408

WEST SUSSEX.—For alterations and additions to a school, for the county council.—Mr. H. P. Roberts, architect, Worthing:—

F. Sanctell & Sons, Worthing	£570
J. Beall, Tillington	508
H. C. Beane & Son, Midhurst	150
H. Tribe & Sons, Midhurst	446
G. Luff, Midhurst	435

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

SEPTEMBER.

19.—Institution of Municipal and County Engineers: Meeting at Cleethorpes.

26.—Institution of Municipal and County Engineers: Meeting at Scarborough.

APPOINTMENTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

WILLESDEN DISTRICT COUNCIL.
APPOINTMENT OF ASSISTANT ROAD SUPERINTENDENT.

The Willesden District Council invite applications for the position of Assistant Road Superintendent.

Applicants must not be less than thirty, and not more than forty-five years of age, and with some experience as to the maintenance of highways.

Applications, in candidate's own handwriting, stating nature of present employment, with copies of not more than three recent testimonials, to be delivered to the undersigned not later than 4 p.m. on Tuesday, August 25, 1914.

The salary will commence at 3½ guineas per week. A conveyance for travelling will be provided by the Council.

The person appointed will be required to devote his entire time to the duties of his office, and the appointment will be determinable by a month's notice upon either side.

(By order)

O. CLAUDE ROBSON,
Engineer to the Council.

Municipal Offices,
Dyne-road, Kilburn, N.W.
August 5, 1914. (1,844)

TEMPORARY CLERK in County Surveyor's Office, Wells. Must be expert shorthand writer and typist. Salary £80 per annum. Apply, in writing only, stating age, qualifications and references, County Surveyor, Wells, Somerset. (1,860)

SWIMMING BATHS WATER PURIFICATION.

IMPORTANT TO MUNICIPAL AUTHORITIES:

Is the water in the Swimming Ponds under your control **always** clear, free from any dullness, and equally bright and attractive **at all times?**

Are the bathers satisfied they can obtain equally good conditions of bathing **every day?**

Is the water free from all **brown stain?** Can you distinctly see a hairpin lying on the bottom of the pond at the deep end?

Unless these questions can **all** be answered in the affirmative, why not adopt our System of Purification, whereby we will guarantee to fulfil all the above conditions with complete success? At the same time the cost of water saved annually will in a few years pay for the plant.

By our System of **Treatment** and **Sterilization** of the water, not only is its Chemical and Bacterial Purity maintained, but freedom from all **disease-germs** is absolutely ensured.

Send us Architect's plans of the baths, and we will furnish Estimates and Plans of the apparatus free. Please at the same time refer to our guarantee.

WRITE FOR PAMPHLET

THE "TURN-OVER" FILTER CO.,
39 CHICHESTER STREET,
BELFAST.

Or Messrs. J. BLAKEBOROUGH & SONS,
BRIGHOUSE.

BISHOP'S STORTFORD URBAN DISTRICT COUNCIL.

The Bishop's Stortford Urban District Council [illegible] a competent Pipe Layer, fitter and Waterman. Increase of [illegible] per week.

Age not to exceed 40 years.

Applications, which must be on Forms to be obtained from the undersigned, stating age, [illegible] and experience, and accompanied by three recent testimonials, will not be returned, to be sent in not later than Friday, the 28th instant, endorsed "Pipe and Inspector," addressed to

ROBERT S. SCOTT,
Engineer and Surveyor.

Council Offices,
Bishop's Stortford.
August 14, 1914. (1,862)

FOREMAN OF WORKS required for Nigeria for one tour of 8–12 months, with possible extension. Age 25–40. £250–£10–£300. Single furnished quarters or allowance. Second-class passages; liberal leave. Candidates must have had considerable experience with a Municipal Authority, and be thoroughly conversant with road and building construction, laying of drains and sewers, also thoroughly understand levels, be able to read plans and section of buildings, drains, &c., and set out work.—Apply at once to the Crown Agents for the Colonies, Whitehall-gardens, London, S.W. (1,864)

TENDERS WANTED.

ESSEX COUNTY COUNCIL.

HIGHWAYS COMMITTEE.

RECONSTRUCTION OF LANGFORD BRIDGE, MALDON.

Tenders are invited from Contractors licensed to execute Ferro-concrete work on the Hennebique system for the Erection of a New Bridge over the River Blackwater, in the Parish of Langford, near Maldon.

Drawings may be seen and Specifications obtained, on and after Tuesday, August 18th, 1914, upon application to the County Surveyor of Essex at Chelmsford.

The Council do not bind themselves to accept the lowest or any Tender.

Tenders, sealed and endorsed "Langford Bridge, Maldon," to be delivered to this Office not later than the first post on Monday, August 31st, 1914.

PERCY J. SHELDON, M.INST.C.E.,
County Surveyor.

Chelmsford.
August 13th, 1914. (1857)

ESSEX COUNTY COUNCIL.

HIGHWAYS COMMITTEE.

RECONSTRUCTION OF FINGRINGHOE BRIDGE, WIVENHOE, NEAR COLCHESTER.

Tenders are invited from Contractors licensed to execute Ferro-concrete work on the Hennebique system for the Erection of a New Bridge over the Roman River, in the Parish of Fingringhoe, Wivenhoe, near Colchester.

Drawings may be seen, and Specifications obtained, on and after Wednesday August 19th, 1914, upon application to the County Surveyor of Essex at Chelmsford.

The Council do not bind themselves to accept the lowest or any Tender.

Tenders, sealed and endorsed "Fingringhoe Bridge, Wivenhoe," to be delivered to this Office not later than the first post on Monday, August 31st, 1914.

PERCY J. SHELDON, M.INST.C.E.,

Vol. XLVI AUGUST 28, 1914. No. 1,180.

Minutes of Proceedings.

Salt-glazed Ware Pipes: British Standard Specification.

The desirability of standardising "stoneware" sewer and drain pipes was urged upon the Engineering Standards Committee at different times from various quarters, and more particularly by the Institution of Municipal and County Engineers, who appointed a committee for the purpose of obtaining information from their members with regard to their requirements for a standard specification. The data thus collected was then summarised by that institution in the form of a draft specification and placed at the disposal of the Engineering Standards Committee. A representative and well-attended conference of users and manufacturers was called early in 1911 to consider whether the standardisation of this class of pipe was desirable, and the opinion of the meeting being unanimously in favour of such a proceeding, the Main Committee formed those attending the conference into a Sectional Committee under the chairmanship of Sir Maurice Fitzmaurice, C.M.G. At an early stage of the work it was found desirable to discard the use of the term "stoneware" as being difficult of definition, and to adopt the term "salt-glazed ware," which was sufficiently descriptive of the pipes, the quality being safeguarded by the imposition of an absorption test.

In drawing up their recommendations for salt-glazed ware pipes, the committee were able to avail themselves of the draft standard specification drawn up by the Standardisation Committee of the Institution of Municipal and County Engineers previously referred to, and of a draft specification based on the proposals of that institution which was subsequently submitted by the pipe manufacturers on the Sectional Committee as the result of a long series of conferences among the manufacturers. These drafts were of material assistance in forwarding the work of the committee, and were of very great help in leading up to the formulation of the standard specification which has now been issued.* The question of putting forward a standard form of socket which would produce in unskilled hands better alignment than the form in most general use occupied the attention of the committee for some considerable time; but, in view of the importance to the industry of not materially increasing the cost of salt-glazed ware pipes, it was not found practicable to proceed with the matter, and therefore, as regards the sockets, only the minimum mean thickness and minimum internal depth, and a minimum jointing space have been specified. The specification divides the pipes into two classes—viz., British Standard Pipes which are made with the intention of complying with the specification, but of which only a percentage are required to be submitted to the hydraulic test, and British Standard Tested Pipes—that is to say, pipes which have been individually subjected by the manufacturer to the hydraulic test laid down in the specification. Among the other points dealt with are the absorption test, permissible limits of deviation from thickness, standard diameter, and straightness, and a standard mark for all pipes complying with the British Standard Specification. The specification is one that should be in the hands of all municipal engineers and architects.

* * *

Sewer Explosions.

The explosions which have occurred from time to time—and possibly with greater frequency in recent years—in sewers are apt to be so disastrous in their consequences, either to life or property, as to merit a very thorough investigation into their cause and possible prevention. The provisions of the Public Health Acts which are designed to prevent the passing of injurious matters into sewers are limited to the prohibition of such matters as would in themselves either interfere with the free flow of the sewage or injure the sewer. Further, it is an offence to permit the entry into a sewer of any chemical refuse, waste steam, condensing water, heated water, or other liquid which, either alone or in combination with the sewage, causes a nuisance or is dangerous or injurious to health. These provisions do not touch the problem of the prevention of explosions, which are due in the main to the mixture of either petrol vapour or coal gas with the sewer air. There can be no doubt that comparatively large quantities of petrol find their way directly into sewers from both public and private garages, and this source of danger could be entirely prevented by the exercise of a little thoughtfulness on the part of those responsible, who probably do not in most cases realise the danger to which they

* The price of the report is 5s. 2d., post free, and it may be obtained from any bookseller, or direct from the offices of the committee, 28 Victoria-street, Westminster. It is published for the committee by Messrs. Crosby, Lockwood & Son, 7 Stationers' Hall-court, Ludgate-hill, E.C., and 5 Broadway, Westminster.

inflammable oils from flowing into the sewers. It exclusion of these dangerous matters from the and of the general composition of sewer air is therefore of great practical importance.

In a recent issue of the *Engineering Record* there appeared a description of a very ingenious apparatus designed by Prof. Dean, of Yale University, for obtaining samples of the atmosphere inside a sewer. The direct method of entering a manhole with a jar filled with water and emptying it near the surface of the sewage was found to be inexact, owing to the changed conditions caused by the opening of the manhole. It was to meet this difficulty that Prof. Dean designed his apparatus. This consists of a long rubber tube let down into a manhole through the small opening left by just starting off the cover. After sounding for depth to find the length of tube needed to reach nearly to the surface of the stream, a bulb on the upper end of the tube is worked until both the rubber tube and the bulb are filled with the sewer atmosphere. Then a small, collapsed, rubber toy balloon is slipped over the firing end of the short piece of brass tubing to which the long rubber suction tube is also attached. Projecting from the brass tube into the balloon are the ends of two insulated wires from a dry cell battery connected by a fine platinum wire. When the balloon is well filled, by further pumping, the stopcock in the brass tube is shut, to prevent backfiring, and the circuit is closed by pressing the button. When the platinum wire becomes heated, if there is an explosive mixture in the sewer the contents of the balloon are exploded. The apparatus is one of great practical utility, and might with advantage be used on any occasion when men are asked to descend into a suspected atmosphere.

* * *

Housing and the War.

Among the Acts passed by Parliament prior to the adjournment on August 10th was the Housing (No. 2) Act, 1914, which provided for the issue of a sum of four millions sterling for housing purposes within a year from that date. The intention of the Government in passing this Act was that the sums made available under it should be utilised for the joint purposes of providing and improving housing accommodation for the working classes, and of preventing or mitigating unemployment in the building trade. It certainly appears to be a wise policy to keep the building trade supplied with useful work, rather than to allow conditions of bad trade to arise with all the consequent waste of money on costly and more or less ineffective relief works. As will be seen from the report of the proceedings which we give in another column, the administration of the new Act formed the subject of a deputation from the National Housing and Town Planning Council which was received by the President of the Local Government Board on Friday last. The deputation fully recognised the desire of the Government to do all in their power to stimulate the building of houses by local authorities and by public utility societies during the war period. In order, however, that the local authorities may be induced to take up the matter with the necessary enthusiasm, it must be made possible for them to borrow the money required at a sufficiently low rate of interest. To meet this point we note with satisfaction that Mr. Herbert Samuel was able to announce, in the course of his reply, that the Treasury will be prepared, so far as circumstances may permit, to consider advances to local authorities of money for approved schemes of building at the same rate as the Government itself is able to borrow. In regard to another point, too, the President's reply was very satisfactory, inasmuch as he made it clear that money lent under the Act would be lent for periods of sixty years for buildings and eighty years for land. A majority of the members of the Committee of the National Council have expressed the view that it is most important that the Government should stimulate local authorities in undertaking housing schemes by making capital grants in aid of the expenditure upon such schemes. This raises a very debatable question of policy which has formed the subject of acute controversy in the past, and it is not surprising therefore that Mr. Herbert Samuel stated that it was not the intention of the Government to use the sum granted under the Act for the purpose of grants in aid. If this were done, every local authority borrowing money would expect to get a grant. The fact that such an Act was passed, together with the tone of the reply of the President of the Local Government Board to this deputation, alike show an earnest desire on the part of the Government to do everything possible to stimulate housing action by local authorities in this period of national need.

* * *

Labourers' Cottages on the Quadruple System.

We give elsewhere an article on rural labourers' cottages which demands very close attention, as it is evident that the designer of these cottages has carefully studied the subject and "knows what he is talking about." The cottages are designed in blocks of four, and although an adverse critic might say that they savour of the back-to-back type, it must be remembered that there are hundreds of existing cottages which have no "through" ventilation, and that this is not required in the open country. The design shows windows of extra large size, and ample ventilation would be secured. The great point is that these cottages, which provide all the necessary accommodation, can be constructed at £150 each, and that this price is essential when considering the question on economic grounds. It is useless to build cottages which either require, in order to make them self-supporting, a rent which the occupier could not pay, or to subsidise them from the rates, as in the latter case it would naturally mean giving to certain individuals an advantage which would be most unfair to their neighbours. A "premiated" cottage would be unsound altogether on the lines of political economy.

We congratulate the author and designer of these cottages, which are also of considerable architectural merit, and quite unlike the monstrosities which are sometimes designed to meet this difficult question. Our correspondent's description and his remarks on the general question of rural housing are excellent. Although this country is at the present moment going through the gravest crisis it has ever encountered, there may come a time when this very important question of rural housing must be taken up in earnest, and we are glad to be able to place these proposals before our readers. We observe in cubing out the contents of the cottages, that at the price given it works out at 4½d. per cubic foot. This price is low, but the work is simple, and the price might suffice in some districts.

* * *

Rural Housing in Ireland.

It is a remarkable fact that while in Great Britain the problem of rural housing remains in what may be not incorrectly described as its initial stages, it has in Ireland been brought to the test, if not of solution, at least of very substantial development. The economic change effected in Ireland by the Labourers' Act amounts almost to a social revolution. Under it there have

been built 43,702 cottages, and the rent received last year was £123,896 which is equivalent to an average weekly amount per cottage of one shilling. This latter figure will make a forcible appeal to our imagination on this side of the Irish Channel, for we have been accustomed to regard the economical aspect of rural housing with something approaching to concern. There is, of course, a disparity of conditions as between the two islands, yet even when this is allowed for the remarkable cheapness with which extensive housing schemes have been carried out in Ireland is none the less a striking feature of the situation. The figures show some peculiar variations in numbers, which are no doubt due to local circumstances chiefly—to the fact that in some localities there is a preponderance of peasant proprietors, for whom the houses are not intended or provided, while in others the labourers pure and simple are in a majority. This, for example, accounts for the fact that in Connaught the number of cottages is 2,165, while no fewer than 15,959 have been built in Leinster, 17,988 in Limerick, and 7,590 in Ulster. In the southern province of Munster £3,231,571 has been invested in cottage building, and in Ulster the capitalised value of the rural cottages provided under the Labourers' Act is £1,747,384. Such totals are a testimony, if any testimony be needed, to the far-reaching effects of the Act; but it is only when we come to details that the real burden imposed upon the local authorities can be appreciated at its true value. Connaught, for instance, has spent upon housing £35 per agricultural labourer, Ulster £42, Leinster £76, and Munster £91. Limerick is credited with the largest number of cottages of any county in Ireland in proportion to its population. The expenditure is equivalent to 1s. 3d. per £ on the valuation. One welcome and beneficent result is to be recorded from the operation of the first Labourers' Act—viz., that after it came into operation in 1883 emigration from Ireland began to decrease, and it has been so appreciably reduced within recent years that the population has ceased to decline. Altogether, it is a very remarkable story, alike economically and socially, that is enshrined in the rural housing legislation of Ireland, and it is to be hoped that in England, Scotland, and Wales we shall be able at no distant date to congratulate ourselves upon equally satisfactory results from the recent activities of the Government.

* * *

Rainfall in 1913.

The importance of the work carried on by the British Rainfall Organisation is so great that we feel more than justified in referring at some length each year to the exceedingly interesting annual volume which is published by that body. The volume for 1913 is now before us, and is the fifty-third of an unbroken series forming a unique and valuable record of the rainfall of the British Islands. The organisation depends very largely for its information upon a large number of voluntary observers, and we venture to suggest that this is a matter in regard to which assistance might very fittingly be given by municipal engineers when required. The value of the data founded upon this systematic work in the field of climatology, particularly for purposes of water supply, is sufficiently obvious, and need not here be insisted upon. The tables and statistics in the volume now under notice are founded principally upon complete daily records received from no fewer than 3,370 stations. Among the special articles included in the book is one on the "Dry Summer of 1913," which well illustrates the difficulty of gathering anything like an accurate impression of weather conditions in the absence of scientific observations. To be told that the summer of 1913 was as remarkable for deficiency of rainfall as that of 1912 was for heavy rains, is itself a little surprising to the average man upon whose mind remains a vivid impression of the devastation in East Anglia, and the ruined harvest of the latter year; but to be further told that the drought of 1911, although standing out prominently in the popular imagination, was really less remarkable than that of last summer is even more surprising. That this is indeed the case, however, is proved by the statistics gathered during the two years in question. It should be mentioned that the volume, as in the case of its predecessors, is illustrated by a number of valuable maps, and has as a frontispiece an excellent photograph of the late Sir John Murray, one of the trustees of the organisation, a feeling appreciation of whose life and work is contributed by Dr. Hugh Robert Mill, who retains the office of director.

* * *

Sewage Disposal and the Protection of Water Supplies.

The problem of protecting water supplies from pollution is always a difficult one on account of the various interests concerned, but it is much more complicated where the waters in question form the boundary between two countries, as in the case of the United States and Canada. It is obvious that it would be useless for one of the two countries alone to carry out any measures of protection, and joint action is essential if any satisfactory results are to be obtained. Fortunately, in the above case this has been done, and the report of a joint conference of engineers, which we print on another page, is of considerable interest and importance. In the first place, it is stated that even river waters which receive the drainage of agricultural and grazing lands are unsafe for use without previous purification. On the other hand, it is admitted that river waters into which the sewage of towns is discharged may safely be used for drinking purposes if the water is purified. Further, the opinion is expressed that the protection of public water supplies is more economically secured by water purification at the intake than by sewage purification at the sewer outlet, but it is admitted that under some conditions both water purification and sewage treatment may be necessary. Disposal by dilution is considered ample for the treatment of sewage in the case of the larger streams and rivers and the lakes, and any elaborate purification by modern processes of filtration are believed to be unnecessary. These opinions are interesting, as they confirm the views of our own Royal Commission to the effect that the disposal of sewage by dilution, under suitable conditions and subject to the removal of the suspended solids, may be adopted without risk of creating a nuisance.

* * *

Proposed Health Week and the War.

We understand that the committee directly concerned with the movement, in conjunction with the Royal Sanitary Institute, are carefully considering the question of the advisability of proceeding with the arrangements for the holding of the National Health Week in November next. On the one hand, whereas it is possible that everyone will be otherwise engaged, on the other hand there is no doubt that questions of sanitation play a very important part when in war. Bitter experience has taught us that the loss of life due to epidemics during a war is far greater than that at any other time, and although it seems almost inconceivable that war will actually reach this island, it is of the utmost importance that we should be prepared for the worst. Should the committee decide to abandon the holding of Health Week, could not the organisation which has already been put in force do something to educate the people on the lines of taking all necessary individual precautions to prevent any spread of an epidemic?

Rural Labourers' Cottages.

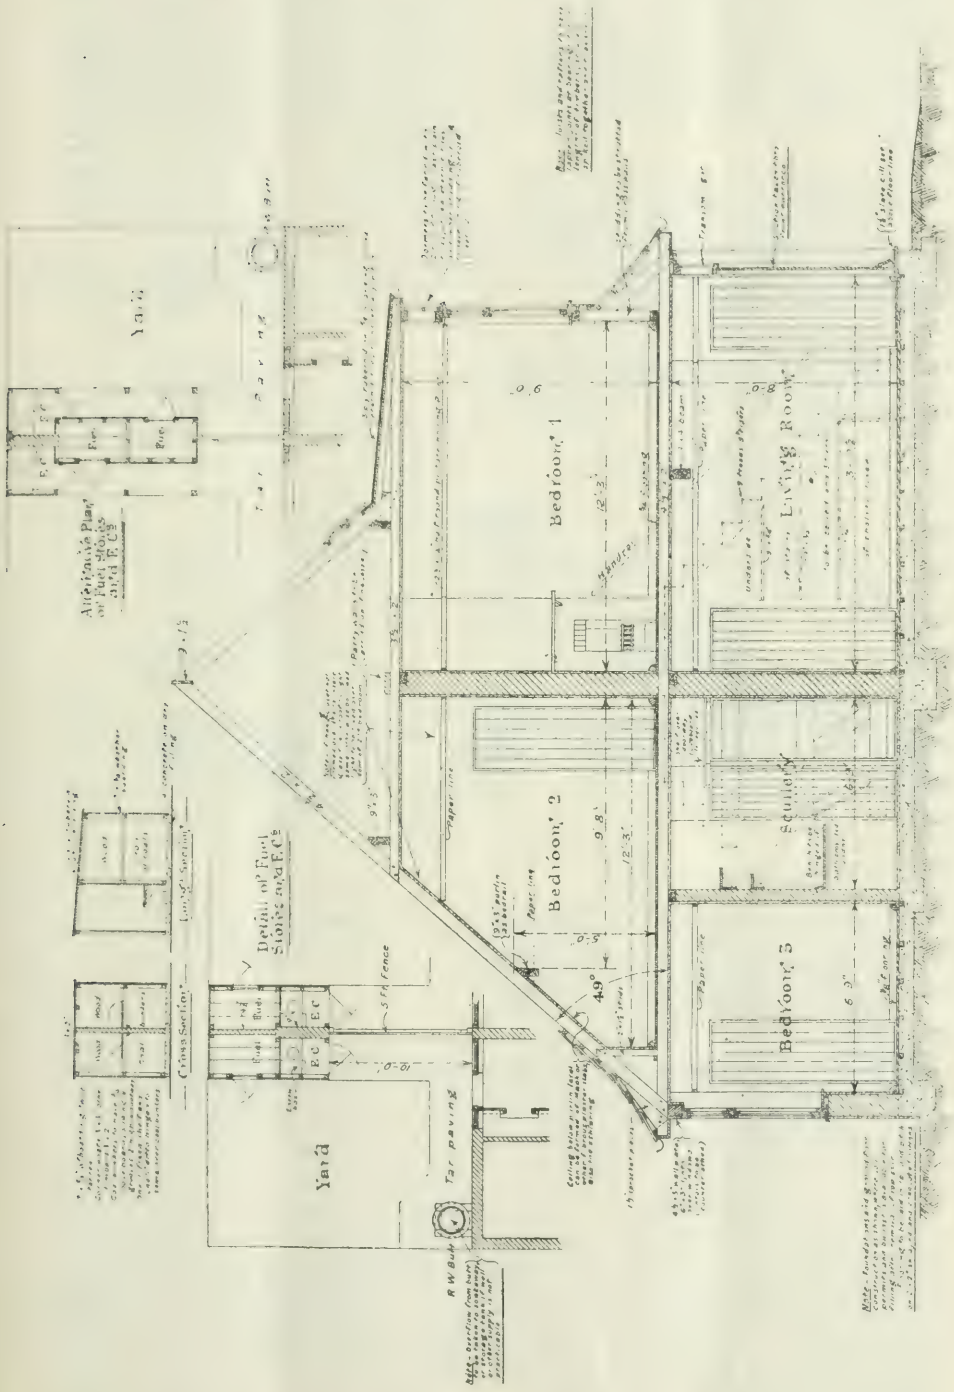
A QUADRUPLE SYSTEM: £150 STANDARD TYPE.

(By a Correspondent.)

[illegible] [illegible] [illegible] [

But the problem has not been reduced to even these relatively simple proportions. All the experiments in cheap housing in recent years and especially the exhaustive efforts made quite lately to discover cheap lines of design, show conclusively that the Government's standard of accommodation cannot, under average conditions, be pursued at a lower figure than from £170 to £180. If such an expenditure is incurred a result commercially unsound must be reached unless, as already remarked, the Government abandon their carefully considered minimum standard of floor areas and cubic contents of rooms.

One cannot overlook the disturbing fact that



LABOURERS' COTTAGES ON QUADRUPLE SYSTEM. ENLARGED TRANSVERSE SECTION.

scrutiny, that a drastic evasion of dimensions has very frequently been perpetrated.

cottages, on altogether robust and attractive lines, which, while an ornament to our glorious countryside, can be put up by [illegible] Given entirely new lines of design, this is confidently asserted to be the case, and the plans, elevations and sections here reproduced illustrate how it is to be done.

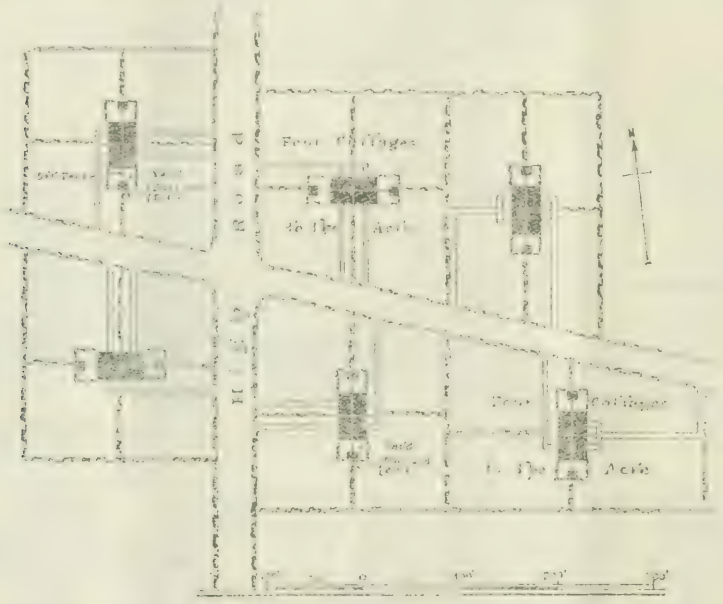
size, larger or smaller, can be furnished to each cottage in the most effective manner; securing the maximum of light and air, and avoiding any necessity for [illegible] ment, which is, of course, inevitable if economy of

(*f*) Although the upper rooms are above the roof-tie level, it will be interesting to note that three sides of each of these rooms have solid brick walls—a valuable guide [illegible] against extreme heat in summer or cold in winter. In the simplest form of construction illustrated it will also be observed that only one side of one room in each cottage has any part of its ceiling sloping.

(*g*) The upper internal walls are natural continuations of those below, there being no partition work. Incidentally, it may be remarked that no bedroom adjoins another without a 9-in. wall intervening.

Many other considerations have been kept in view in the details; for instance, it will be seen that, while the space in the second bedroom below the 5-ft. ceiling line is not recognised by the Government requirements as part of the floor area or cubic contents, this space has been left open as a useful receptacle for boxes, boots, &c., while the purlin shown serves as a bedrail to protect the plaster and to mark the paper line.

Turning to general construction, it will be quite obvious that the operation of putting up four cottages simultaneously, the simple run of walls, the straightforward character of floor, roof timbering



Labourers' Cottages on Quadruple System. A Colony of Twenty-four Cottages to the Cross Roads

construction is attempted by building cottages in rows of three or more.

Turning to the ground and upper floor plans, the dimensions of all the rooms, both in floor areas and cubic contents, comply strictly with the minimum standard laid down by the Government. As regards internal planning, it will be seen with what measure of success all those features have been secured, features small individually, but which in the aggregate go so far towards the amenity of a dwelling. Some of them may be enumerated:—

(*a*) The entrance lobby gives access by a straight stairway direct to the upper rooms, a valuable point in many ways—such as sickness, passage of furniture, &c.

(*b*) The living-room, while directly accessible from front door, stairs and scullery, gives the maximum of floor space free of traffic, and an unusually comfortable fireside away from draughts.

(*c*) All chimneys are on inside walls, affording maximum warmth and dryness.

(*d*) All bed spaces are against inner walls, while their positions afford the fullest amount of unimpeded floor space.

(*e*) A bath space is available, if required, under a hinged bench in scullery.

and roof covering, the proportionately short lengths of eaves, verges and ridges to each cottage, and particularly the small amount of external walling, all conduce in a special degree to economy in the building process, to great reduction of labour in cutting of materials and savings in waste of the latter.

The first floor joists and rafters throughout can be cut out of 4½-in. by 2-in., as the former have in no case a bearing of more than 6 ft. 9 in., and practically any odd lengths can be used up. It is assumed that the recommendations of the Small Holdings Committee, by which timbers can be taken through party walls, will be recognised by the Government; failing this, such timbers can be cut short of the party walls and secured together by dog-irons, the latter being left buried in the brickwork. By-law questions such as this do not, of course, arise in the many rural districts which have no by-laws, nor in those where the Local Government Board Rural Model By-laws have been adopted.

A very important consideration is that this type of cottage can be reproduced in the materials common to practically every district in the kingdom, while the scope of the roof is suitable for any type of tiles, eternit, or other patent covering, although

...state can, of course, be used if local circumstances render it unavoidable.

The ample eaves give specially good protection to the external walls, while the guttering is simple and distributes the rain-water easily into a butt to each cottage.

It will be clear that these cottages are not, properly speaking, on the "back-to-back" principle, so much in vogue in some Northern towns, and so rightly condemned. "Back-to-back" dwellings, built in terraces (generally in congested areas), in which the marked feature is the possession of only one outer wall, rendering it impossible to secure effective air currents in the interior, have nothing in and, in addition, a spare flue is provided in the central chimney-stack as an exhaust to which all the living rooms and bedrooms over it can be connected by a vent at the ceiling line.

To revert to the all-important architectural question, it seems quite beyond argument that by no other method of planning can large and robust lines of exterior treatment be wedded to the humble scale of accommodation and expenditure to which we must strictly adhere if the undertaking is to pass the strict actuarial tests of H.M. Treasury.

Incidentally, these large exterior lines of walling and roof lend themselves with peculiar facility to the avoidance of over-crowding. [illegible] effect. A few ex-

[illegible] Cottages on Quadruple System. Alternative Elevations.

common with the type of dwellings now under review and intended for erection on the breezy countryside. Should, however, some academic point be raised in this direction, it may be remarked that the Town Planning Act of 1909 expressly permits the erection of "back-to-back" houses, as that term is commonly understood, provided that the medical officer of health of the district is satisfied that they are efficiently ventilated.

In the designs now being considered all the rooms have their windows, doors and fire openings so arranged that an active circulation of air is secured, amples are given of the practically endless variations of treatment obtainable. It has to be borne in mind that any slight additional cost incurred in varying the external treatment of a block is divisible by four in considering the cost of each cottage. It is necessary to add that the plan given is common to all the variations in elevation.

The architectural possibilities cannot fail to be of interest to those who realise the importance of this aspect of the matter, regarded alike from the point of view of public opinion and of the educative results to the occupants, who are bound to experience

LABOURERS' COTTAGES ON QUADRUPLE SYSTEM. ALTERNATIVE ELEVATIONS.

in the estates concerned which can be treated in this [illegible] per cent on the total cost, thus bringing the original figure of £62 down to something under £50, or, [illegible]

	£ s. d.
[illegible]	4 6
Interest on cost of [illegible]	3 18 0
Sinking fund on cost of building, 60 years ...	15 10
[illegible]	2 0
Repairs, [illegible]	1 12 6
	£6 12 10
Per week, exclusive of rates ...	2 6

If, instead of the Government rate of borrowing at 3 per cent., a rate of 4 per cent. is taken, the necessary weekly rent will be 2s. 11d.

These figures can, however, be further appreciably reduced on one condition—viz., that a system of standardisation of materials, joinery, fittings, &c., and purchase of these on a large scale—be inaugurated by the Government. The widely varied external possibilities will not be affected by such standardisation.

The plans and designs are, of course, subject to the Copyright Act, 1911, but copies of the drawings and any further particulars, together with licence to erect at a nominal royalty, can be obtained from the architect, Mr. C. Lavington Fielder, Kingsmead, Latchmere-road, Kingston-on-Thames.

PRO PATRIA.

In THE SURVEYOR of August 21st, in the column of "Things One Would Like to Know," it was asked if it would not be possible to compile an Honours list of municipal, engineering and sanitary officials who are taking an active part in the present war. With a view to carrying out the suggestion we publish below such information as has come to hand, and should be obliged if readers would assist us by notifying us of other cases within their knowledge:—

Ashurst, J., city surveyor, St. Albans.

Ayre, C. A., third assistant engineer to the Watford Urban District Council, has received notice to hold himself in readiness for the Special Reserve.

Barker, E. A., electrical engineer, Barnsley Corporation.

Bell, [illegible], sanitary inspector, Westhampnett Rural District Council, Lieutenant and Transport Officer attached to the Eastern Mounted Brigade of Field Ambulance (Territorials).

Blake, Leslie, assistant surveyor to the Wincanton Rural District Council.

Jenner, ——, inspector of nuisances to the Battle Rural District Council.

Middleton, ——, inspector of nuisances to the Charlton Kings Urban District Council.

Aberdeenshire Roads.—The road surveyor to the Deeside District Committee, Mr. A. H. Clayton, reported recently that for the past year the total quantity of material applied over the 310 miles of roads maintainable by the committee, for road maintenance alone, amounted to 30,168 tons, and to that quantity had to be added 10,000 tons of strengthening and surfacing material which was applied, under contract, to the section of the Braemar-road between Ballater and Coilacreich. The application of that large quantity of material was, he was happy to say, having the desired effect. In his opinion, this wholesale strengthening of weak roads with local materials not only solved the problem of movement in the subcrust, but also provided a reliable foundation upon which might be applied the improved surfacing materials now in vogue. During this summer a length of roadway running through the village of Braemar was repaired with a strong coating of broken stones bound together with pitch-grouting, and surfaced with a small-gauge material similarly treated. The cost of this system worked out at 2s. 6d. per square yard, compared with 1s. per square yard for the ordinary water-sweep system, and although there is a big difference in the initial cost of laying the systems, the pitch-grouted roadway, with a much longer life, would ultimately work out as cheap as the old system, with the additional benefits of a smooth, waterproof, and less dusty surface.

SANITATION OF A HEALTH AND PLEASURE RESORT.*

By THOMAS SANDERSON,

Chief Sanitary Inspector, Blackpool.

Blackpool is classed and always spoken of as a town of 66,000 inhabitants, but we have housing accommodation in the town for between 400,000 and 500,000 people; and this, I think, constitutes a fairly large town or city; consequently it is necessary for us to have a staff of sanitary officials capable of dealing with the work of a town with a population of 400,000, in addition to the day visitors, during the visiting season.

In the year 1903 we set a certain standard of sanitation for all houses in the borough, and a [illegible]-house inspection and testing of drains was commenced in a systematic manner.

On receipt of the inspector's reports the drains are tested and examined—that is, yard drains, cellar drains, and front rain-water drains.

The district inspectors then survey the house and draw a plan to ¼-in. scale, showing the ground floor, cellar, yard, front garden, drain and sewer. The usual notices are served, and when the work is completed a full report of the work carried out is entered and the new system of drainage placed on the plan.

The work done in practically all cases is that the drains are relaid in an up-to-date manner, intercepted by a suitable intercepting trap, inlet and outlet ventilators, yard service re-formed with concrete, flags or asphalt, the front garden surface formed in such a manner as to prevent dampness to the house, damp-proof courses fixed in walls where there is any sign of dampness, sites drained where required, cellar surfaces formed with concrete or flags, cellar areas formed for the placing of gullies for cellar drainage. No drains are allowed under the house, except where it is impossible for them to be placed elsewhere, and in such instances the earthenware pipe drain is embedded in good concrete 6 in. thick, or iron pipes substituted.

Any water-closet inside the house that is not self-cleansing is abolished, all boxed-in seats are abolished where new water-closets are fixed, all defective or tapped T pieces in soilpipes are abolished, and joints repaired. Roofs, roof gutters, downpipes, &c., are put in proper order, and each bedroom in which there is no fireplace is ventilated. We have only about six months in every twelve that we can carry on this work in large property, as it is impossible to do such work when there are visitors in the houses.

All new property previous to occupation is inspected, and the drains, soil pipes, water-closets, &c., tested by the health department and reported upon to the borough engineer, who sees that any defects reported to him are made good.

The sewage here is discharged into the sea by two separate outlets, the sewage being screened. The foreshore is inspected daily by an inspector, and anything objectionable found is removed at once by the cleansing department.

House refuse is stored on the premises in the majority of houses in round galvanised iron bins with covers, provided by owners; we have no deep ashpits. Shop refuse, paper, &c., is stored in special bags hung upon brackets specially constructed for that purpose. The health department sees that these are provided, the brackets by the occupier and the bags by the cleansing department. Refuse in all large property is collected daily, in some parts of the town three times per week, some twice per week, and the remainder once per week. Fish offal is collected daily.

The streets are swept and cleansed by the cleansing department, salt water is used for swilling and watering streets, flushing sewers, gullies, &c. In the first week of August, 1913, 563 tons of house and trade refuse and 30 tons of fish offal was carted to the destructor.

The Civic Engineer's Who's Who, compiled by the editor of THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER, for a second annual issue is remarkably complete. The biographical matter is full and methodically arranged. The book is published by the St. Bride's Press, Limited.—*Liverpool Courier.*

*From a paper presented at the Annual Congress of the Royal Sanitary Institute at Blackpool.

INJECTION OF CEMENT GROUT INTO WATER-BEARING FISSURES.*

[redacted]

[redacted] The contract for the first [redacted] was let to the J. A. Caniff Company, this section to known as the Kensico siphon. It [redacted] under the Kensico valley at a depth of from 80 to 300 ft., and is about [redacted] long. The engineers expected that considerable water would be encountered, but fortunately this was not the case except at one shaft, known as No. 4, which penetrated the rock at a junction between limestone and conglomerate.

Water-bearing fissures were encountered almost immediately. At a depth of about 200 ft. a flow of 1,500 gallons per minute was struck. The shaft then contained as many pumps as could be used, and it seemed impossible to sink it further. After vain efforts had been made to proceed, John P. Hogan, a division engineer of the Board of Water Supply, suggested that a combination of the methods be tried. The process was then [redacted] for the first time in this country.

Since the shaft was partly full of water it was necessary to drill grout holes with a diamond drill. Platforms were placed on the timbers at the water level, the diamond drill was installed, and six 90-ft. holes were drilled in the bottom of the shaft. Several cut loads of cement were pumped through these holes into the fissures, the drill casings being used for grout pipes. This largely cut off the flow of water from the bottom and sinking could then proceed. After that, water-bearing seams were grouted as soon as encountered, and the contractor was able to finish the shafts and tunnel within the contract time. Shaft No. 4 was a rectangular, timbered construction shaft with no concrete lining; consequently it was impossible to cut off any of the water entering from above the point where grouting was first attempted. On this account large volumes of water had to be pumped until the tunnel was finally sealed.

At the next wet shaft the writer had to do with advantage was taken of the experience gained at shaft No. 4. At the second shaft, No. 1 on the [redacted] York City syphon, good progress was made until a depth of about 100 ft. was reached. The first hole drilled in the bottom below this depth struck a stream of water; the flow amounted to about 150 gallons per minute. This was plugged [redacted] that each of the twelve holes in the sump cut encountered the same stream of water.

[redacted] it was plugged with a tapered wooden plug. After all the holes in the sump had been drilled and plugged in this [redacted] one at a time, so as to restrict the flow of water into the shaft. Each connection was made with a piece of 2-in. or 2·5-in. iron pipe about 3 ft. long, threaded at one end and given a long taper at the other. The tapered portion was made rough on the outside by nicking it with a chisel. A heavy iron stopcock was screwed to the pipe, the tapered end wrapped in several thicknesses of burlap, the wooden plug removed from the drill hole and the tapered pipe driven in, the stopcock being left open. This was the most exciting and the wettest part of the job. After the pipe had been driven in hard the stopcock was closed.

THE GROUTING MACHINE.

In this case connections were placed in all the wet holes before grouting. The grouting machine or tank used on the aqueduct was the Caniff machine, in which the grout is mixed by air. It is built like an air lock with a door on the top through which cement, sand, and water are introduced, and has a 2-in. discharge opening in the bottom and air connections top and bottom. The discharge opening is connected to the grout hole by a heavy rubber [redacted] Another 2-in. stopcock is placed at the outlet of the tank, and a 2-in. by 1-in. tee is placed between [redacted] and the pipe in the drill hole. Into the side opening of this tee a 1-in. [redacted] is screwed.

The machine is installed at the bottom of the shaft, and is connected to one of the holes and also to the high-pressure air supply. The 2-in. stopcock on the machine is closed and the other opened. The door in the top is opened, a sack of cement, three or four buckets of water, and (if the cavity to be filled is large) a sack of fine sand are poured in, the air connection at the bottom is opened and the air allowed to bubble through and mix the grout. Then very quickly the door is closed, the lower air connection is closed, and the discharge connection and the upper air connection are opened, and the air enters and drives the grout into the cavity. A man stationed at the 1-in. stopcock keeps opening it a crack; when air shows instead of grout he closes the 2-in. stopcock and the machine is recharged. If the cavity is open the charge is pushed in in three or four seconds. By working continuously more than 1,000 batches can be placed in twenty-four hours.

The grouting of the fissure was successful and sinking was resumed. About 50 ft. further down another water-bearing fissure was drilled into, and this, instead of being open, was filled with sand formed by the crushing of metamorphic gneiss due to folding; this sand was carried up out of the drilled holes in large quantities by the water. Grout will not permeate sand, and it was necessary to continue drilling holes and pumping in grout, increasing the pressure at the end from 100 to 400 and 500 lb. to the square inch. The sand was tamped so full of cement that when cut through it was compacted like sandstone and contained balls of grout from the size of a [redacted] as large as a man's head.

The most difficult grouting on the aqueduct was done on the Hudson syphon, which is a deep syphon tunnel under the Hudson river at a depth of 1,100 ft. below tidewater. The shafts were sunk by the city forces, after which the contract for the driving and lining of the tunnel and lining the shafts was let. About 150 ft. from the foot of the east shaft the heading cut a water-bearing fissure which flowed about 300 gallons per minute. The full flow did not develop until the cut was blasted. The problem then was to grout this flow against a hydrostatic pressure of 500 lb. per square inch, with no solid rock to which to make grout pipe connections. This problem was finally solved by the construction of a concrete bulkhead 8 ft. thick across the full section of the head. The concrete was mixed in proportions of 1: 2: 4, and was heavily reinforced with rails set into holes drilled laterally into the sides, roof and floor of the tunnel. Grout pipes leading into the fissure were set through the bulkhead. After the concrete had set for a week, grout was forced into the fissure, first by the pneumatic process with a high pressure air compressor, and finally by means of a high pressure plunger pump which forced water instead of air into the grout tank. Pressures were reached in this way up to 1,000 lb. per square inch.

In driving or sinking through rock containing a large number of seams carrying small quantities of water, it is not practicable to stop and grout each seam as described above. In this case it is advisable to increase the section of tunnel or shaft sufficiently to allow for a heavy concrete lining. Drains should be provided opposite all the water-bearing fissures to carry off the water while the lining is being placed. After the concrete has secured sufficient strength, the drains may be grouted. By a combination of these two methods it should be possible to penetrate any firm rock, no matter how much water it contains.

* From the Transactions of the American Institute of Mining Engineers.

Sewage Disposal at Lewes. The new outfall sewage works at Lewes commenced working recently, after a ceremonial "opening" held at the pumping station at Southeram. It was stated that the works were the result of ten years' labour of the Sewage Disposal Committee. The following statement shows the amount to be expended on the scheme: Amount expended, £38,095; estimated amount required to complete the works, £10,770; add 10 per cent for contingencies, £973; total, £49,838.

ADMINISTRATION OF THE NEW HOUSING ACT.

DEPUTATION TO MR. HERBERT SAMUEL.

On Friday morning last the President of the Local Government Board received a deputation of representatives of the National Housing and Town Planning Council, including the executive members of the committee. Councillor Harold Shawcross, J.P. (chairman, Rochdale), Alderman W. G. Wearmouth (ex-mayor of Batley), Alderman J. P. Spencer, J.P. (Tynemouth), Councillor T. R. Marr (Marr & Sons), Miss C. P. Lovejoy (Cheshunt), Councillor F. M. Elwood, J.P. (Ruislip-Northwood Urban District Council), Mr. F. R. Aycott (Ruislip-Northwood Urban District Council), Mr. Raymond Unwin, F.R.I.B.A. (Hampstead), Mr. B. Seebohm Rowntree, J.P., York, Councillor S. Shattock, J.P. (ex-chairman of Building Trade Employers), Mr. Albert E. Cave (London), Mr. A. W. Skelton (Nottingham), and Mr. Henry R. Aldridge (secretary). Mr. Neil Kerr-Shaw, assistant secretary, Local Government Board, was also present.

The chairman and secretary briefly introduced the deputation, and placed before the President of the Board the following memorandum. The chairman specially emphasised the fact that the members of the committee were unanimously of opinion that the rate of interest for housing loans under the new Act was a point of fundamental importance.

DEPUTATION'S MEMORANDUM.

"We gladly recognise that the Government, through the Local Government Board, wish to do all within their power to stimulate the building of houses by local authorities and by public utility societies during the war period. We believe this policy to be wise on the two reasons:

"(1) That the supply of private capital for financing building operations will be greatly restricted during the period, and there may be a great lack of employment in the building trade, with consequent distress.

"(2) That it will be better to keep the building trade supplied with useful work than to allow conditions of bad trade to arise with all the consequent waste of money on costly and more or less ineffective relief works.

"We believe that many local authorities will be willing to take action in regard to the building of houses where a shortage can be shown to exist, and that facilities given by the Government to secure this end will be welcomed and consequent action taken. Two points are, however, of fundamental importance—viz.:—

"(*a*) While recognising the difficulty which the Treasury may have in financing housing schemes at the present time, we are convinced that any proposal which involves the payment of interest by local authorities at a rate higher than was current before the war would meet with little response from them.

"(*b*) The procedure for granting housing loans should be the one familiar to local authorities—viz., for periods of sixty years for building and eighty years for land.

"We desire to add that, in the opinion of the majority of the members of our committee, it is most important that the Government should stimulate local authorities in undertaking housing schemes by making capital grants in aid of the expenditure upon such schemes. We also suggest that arrangements should be made for the granting of housing loans to public utility societies at rates of interest current before the war during this exceptional period, and that the proportion of the loan to the value of the property should be raised from two-thirds to nine-tenths. The Government may in making these loans in war time have to make some sacrifices—for example, the difference between the rate at which they can borrow and the rate at which they lend to local authorities. In return, we think the Local Government Board should stipulate for several special features in the various housing schemes submitted by local authorities. Thus we would strongly urge that wherever possible houses built in urban districts should be built under town planning conditions, with a limitation of houses to the acre of from twelve to sixteen. We would urge that in rural areas provision should be made for each house having a garden area of ¼ acre; or that, if it is decided to build on less than this area, in no case should there be more than eight houses to the acre, and that provision should be made for those tenants who wish to obtain extra land for allotments close to their homes. We think that local authorities should also be required to adopt a good standard of housing for example, the sizes of rooms should not be less than those recommended by the Small Holdings Committee, and three rooms in addition to the living room should be provided. We would press upon the Government the desirability, if this be possible, of allowing such houses to be built with concessions in the width of roads in a simple form of town planning scheme applicable to the area on which the houses are to be built."

MR. SAMUEL'S REPLY.

Mr. Herbert Samuel, in replying, said that the great interest shown by the Government in the points raised by the deputation could be seen from the fact that the Government had, before adjourning on August 10th, passed a Bill providing for the issue of £4,000,000 for the purposes of housing. The Government had, of course, considered whether a part of that capital important work could be found under the new Act was that of the rate of interest for these loans. A conference to consider this point had been held, and at this he had met representatives of the Treasury and of the Public Work Loan Commissioners, the Secretary for Scotland, and other gentlemen advising him in the matter. As a result of this conference, and with the approval of the Committee on Urban Housing, recently appointed, he had sent a circular to the local authorities. In this circular he stated that it was the intention of the Government that such sums as might be made available under the new Housing Act should be utilised for the joint purposes of providing and improving housing accommodation for the working classes, and of preventing or mitigating unemployment in the building trades. The Treasury would be prepared, so far as circumstances might permit, to consider advances to local authorities of money for approved schemes of building which would meet the above objects at the rate at which the Government might be able to borrow. In regard to the proposal that loans should be granted at a fixed rate per cent say 3½ per cent during the war period, he wished to point out that no one could possibly forecast what the rates of interest would be for several years after the war. Many great nations were consuming capital at the rate of millions of pounds per day, and this would produce a scarcity of capital at the end of the war. If, in addition to that in this country a trade boom, the rate of interest would be high as a result of the great demand for capital. In closing, Mr. Samuel again expressed his earnest desire to do all that he could possibly do to stimulate housing action by local authorities in this period of national need.

In the discussion which followed Mr. Samuel again made it clear that in cases under the new Housing Act the Government would lend local authorities money at the rate of interest which the Government had to pay, that the money thus lent would be lent for periods of sixty years for building and eighty years for land. He thought that, if at the end of the war period, or at subsequent periods, local authorities could borrow money at lower rates of interest, they would be allowed to use it to extinguish the loans granted during the war period. Mr. Samuel also stated that the Treasury had consented to the granting of loans to public utility societies for nine-tenths of the value of the property, as against the two-thirds provided for in the Act of 1909. The question of the rates of interest to public utility societies and the periods of the loan was, however, still under consideration.

Mr. Unwin and Mr. Shawcross raised points as to the possibility of securing the co-operation of local authorities and public utility societies for the purpose of building.

Mr. Samuel promised to consider these fully if Mr. Shawcross and Mr. Unwin would place before him in writing the precise schemes which they had in mind. In regard to the question of the planning of the land to be built on, he had already given consideration to this matter, and he proposed to communicate with local authorities at a later date. It had, however, been thought better not to deal with the question in the circular already issued.

Councillor Marr and Alderman Wilkins raised the question of the possibility of using part of the £4,000,000 provided for in the Housing Act for the purpose of grants in aid.

Mr. Samuel, in replying, stated that it was not the

[illegible]

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Is the Royal Automobile Club to be congratulated on the splendid response to the secretary's invitation to members to offer their services or the use of their cars to the War Office, when we hear that over 1,000 have already enrolled? Is not this a fine recent example of patriotism shown by those who are so often accused of keeping cars for the purpose of joy rides only?

• • • •

Is the Board of Agriculture or other Government Department taking steps to see that the corn crops of the country will be carried and stacked without delay? Would it not be possible to induce able-bodied men of means to spend their holidays in a healthy and pleasant form of recreation by assisting in this work? Would it not be possible in cases where horses have been commandeered by the military to carry the corn in hand-carts and stack the crops in the fields in which they have been grown?

• • • •

Why is it that the streets of London are in some districts so badly "named" in comparison with many provincial towns, and why cannot the use of the 6-in. white tiles with black lettering be more generally adopted in the Metropolis? Is not this description of nameplate the most visible, the "tidiest" and the most lasting of all descriptions of nameplates? Has not the London County Council the necessary powers to affix these nameplates on any street-side they may select?

• • • •

Why is it thought necessary, in many cases throughout the country, to take up the existing "road formation" for the purpose of substituting a foundation when there is often a sufficient thickness of time and traffic-compressed old roadway to form an excellent foundation for a thin wearing crust of some suitable formation? Are there not many cases where time, labour, and unnecessary expenditure could thus be avoided?

• • • •

Why is it that there is a large and imposing statue of Brunel on the Thames Embankment and only a very small plaque of Bazalgette? Is it to be wondered that in a recently published guide book of London we are seriously informed that Brunel designed and carried out the Thames Embankment! What was the reason that Brunel was thus honoured by the London County Council whereas the great engineer who helped to make London habitable was ignored?

• • • •

Who can invent a comprehensive name for the method of construction of the road of the future, now that "macadamised" is a thing of the past? Will any of the following suggestions quite meet the case: "Compitensed," "Hoodeyised," "Gladwellised," "Brodieised," "Drylandised," &c., &c.? As none of these appear to be very applicable, how would "Bituminised" meet the case?

• • • •

What do surveyors think of the "Shock-shifter" wheel? Are there not possibilities, in an axle of this description, that the blow on the road from the wheels of rapid, heavy motor vehicles will be transferred into a rolling motion, and is this not "a consummation devoutly to be wished"? Would not the introduction of such wheels, if they effect this transference, tend to preserve our roads from the hammering action to which they are now subjected?

• • • •

Is it not rather surprising to learn that in three of the large Yorkshire manufacturing towns there are still no fewer than 46,865 privies in existence? Does it not seem to be almost incredible that with our modern sanitary knowledge such "obscenities" should still be permitted to remain, and should not steps be taken to convert these mediæval contrivances into more modern appliances?

CORRESPONDENCE.

Sir, though I would persuade, I'll not constrain.
Each man's opinion freely is his own
Concerning anything, or anybody.

—Massinger: "The Fatal Dowry," Act ii, 2.

FAST TRAFFIC: ITS EFFECT ON ROADS, AND THE REMEDY.

To the Editor of The Surveyor.

Sir,—Editorially, in your issue of June 19th last, you invited criticisms of an article in the same number by "Contributor" entitled "Fast Traffic: Its Effect on Roads, and the Remedy."

The writer wishes to submit now two comments. First, he desires to compliment both the author and the editor on their ideas as presented in this connection, and to say that he agrees heartily with the editor in his commendation of a study of "Contributor's" article by highway engineers especially, and a public presentation of their views in the matter. Personally he agrees with the editorial comments in the matter.

The second remark he would like to make now is this: He regrets that, although "Contributor" emphasises the point that the effect of vehicles on the road surface is largely affected by the speed, and notes the fact that the average speed of vehicles on roads generally has greatly increased in the last few years, he nevertheless (in the second instalment of his article, July 3rd) falls back on a criterion of wear based on utter neglect of speed. He refers to tonnage "per yard of width" that "has passed over the road since the crust was laid down," but there is no statement to show whether this passage was slow or fast. To the mind of the writer, it may make all the difference in the world as to many of the deductions thereafter to be drawn.

The writer has endeavoured before to bring this matter of the effect of speed of vehicles to the attention of highway authorities, and on March 10, 1911, The Surveyor published an article by him attempting to demonstrate the importance of its consideration, and suggesting a way therefor. The particular point now desired to be emphasised by the writer is that, apparently, although the effect of speed is generally recognised in the problem, sufficient provision for its recognition has not yet been generally made. The French system of computing traffic counts makes no provision for its inclusion. That of the British Road Board does include consideration of the weight of vehicles, but apparently none of their speed, and this is most regrettable in view of the newness and importance of its work. A host of other recorders (including, evidently, "Contributor"), while probably willing to admit an effect by speed, are accumulating information which later may be found to be far less valuable generally than it might be were the compilations, now begun to be made and published, to include a reduction by a factor which should take into consideration the speed, as well as the weight, effect on the particular crust in each case. Later, circumstances may then prevent the desired reduction in many cases, and the value of the published summaries thus be then less than zero.

The importance of proper comparisons of traffic conditions probably does not need to be re-argued here, as the awakening among both engineers and laymen to the dependence of the solution of many of the problems now pressing in highway work, and so clearly resting their answers on comparisons of the traffic, has recently been so general. The crux of the situation seems to be the division of a proper unit of measure of traffic.

The writer hopes that such competent parties as the editor and "Contributor" have shown themselves to be for considering the science of highway engineering may be able, with others, to give this matter the prompt attention he feels its importance warrants.—Yours, &c.,

W. W. Crosby.

Baltimore, Maryland.
August 13, 1914.

The War and Sewage Disposal Schemes.—At a special meeting of the West Riding Rivers Board at Wakefield recently it was resolved to ask all local authorities having sewerage or sewage disposal schemes in progress or in contemplation to proceed with the work as soon as possible, so as to provide useful employment in their respective districts. It was also decided to ask the Local Government Board to expedite all schemes submitted to them.

The Surveyor
And Municipal and County Engineer.

SOME RECENT PUBLICATIONS.*

A GLOSSARY OF ROAD TERMS. By H. Percy Boulnois, M.Inst.C.E., &c. Price 2s. nett. London: St. Bride's Press, Limited.

The author of this useful glossary seems to have approached his difficult task with three main ideas. In the first place he has provided short definitions of certainly nearly all the words which are, generally or locally, applied to things and processes used in road making and maintenance. Many of these words have ordinary meanings, apart from road work, and in such cases the author gives, of course, only the special meaning. In the second place, the glossary includes a number of terms which are not specially applicable to road work, but are, as it happens, often used in connection therewith—words such as "crude," "crumble" and "sediment." Thirdly, Mr. Boulnois has included a considerable number of words relating to subjects which have a bearing upon road matters, these including some chemical terms and a large number of topographical words. For the most part the definitions given in these three classes are adequate and correct, and the range is so great—from scientific terms to local or slang words—that the glossary should prove exceedingly useful to all grades in a road staff, from the chief engineer of a county to the ganger in charge of half-a-dozen men.

In his preface the author writes: "I still feel that the glossary is far from complete, and I hope that I may receive some further suggestions for improvement in a second edition, which—should the demand justify it—may follow this first attempt." In view of this statement, and in the hope that familiarity with the glossary in its present form will lead road engineers to demand, and to contribute suggestions for, a second edition, the present review may, perhaps, not unfittingly take the form of a friendly but somewhat searching criticism. Let us consider, then, what are the most notable limitations of the book with respect to each of the three classes of words which have been recognised in it as explained above. As regards words which are specially road terms, it may be suggested that the definitions might with advantage be expanded in a good many cases. The definition, for instance, of "pun," "pug-mill," "scarify," "drag," and other terms are too short to give a clear idea of the meaning in each case. In the case of "crust" and "road crust" the attempt to condense the explanation of the meaning results in this, that the essential idea expressed by the word "crust" is altogether missed. The term was deliberately introduced to designate the whole thickness from subsoil to surface, and it is too useful a term to be frittered away into various less definite meanings. As regards the second of the classes, general words often used in connection with road work, some of these seem to be unnecessary, and in a few cases the definitions are inadequate. Examples of inadequate definitions are "depot," "aqueduct," "invert," "lagging" and "derrick," the last-named being defined as "a boom supported by posts and stays," though neither "boom" nor "stays" is defined. In the third class there are limitations of two kinds to the scope and usefulness of the definition. In the first place geological terms and terms relating to certain other subjects have been left out altogether, and, in the second place, the scope of the glossary as regards the subjects introduced is notably and arbitrarily limited. If, for instance, it was thought desirable to include topographical terms such as "dell," "saddle-back," "mere" and "ravine," it was surely of equal importance to include a number of other terms which are not to be found in the glossary, such as "glen," "dale," "spur" and "pass." Similarly, we find that the terms relating to law and administration are not more important than other terms under these heads which do not appear in the glossary.

As regards geological words, Mr. Boulnois states in his introduction that he contented himself "with scrupulously following the names settled by the Engineering Standards Committee in this direction." It is a pity that he has done this, and not only because he widens the scope of the wrong done to the English language by the committee, but also because one result is that his glossary is without a single hint as to the differences between such rocks as granite, basalt and limestone. We find, too, this anomaly, that the expression "trade name" is applied to "Akonia" and "Quarrite" on the one hand, and to "limestone" and "schist" on the other hand. All we are told about "shale" is that it comes under the trade name of "schist." It is, indeed, to be regretted that Mr. Boulnois has not included in his glossary suitable definitions of rocks and rock-forming minerals.

A few criticisms of the definitions themselves may now be offered. A number of them are not sufficiently explanatory, or do not convey the whole of the essential information. Examples of these are "briquette," "ferro-concrete," "off side," "street," "tare," and "trunk roads." "Silica," we are told, is "silex or flint." Turning to "flint," we find that it is "a variety of chert found in the chalk." Looking up "chert," we find that it is "a road-making rock coming under the trade name of flint, as settled by the Engineering Standards Committee." Some of the definitions are somewhat vague, such as "breaking track" and "pockets," and some have been included for no apparent reason. Examples of these are "decay," "charge," and "immerse." If "immerse," why not "swim"? Lastly, there are some terms which, it may be suggested, may be marked down for correction in a future edition. A "ditch" is an *open* drain; a "revetment" is not a wall; a "watershed" is not, correctly, an area; a "rimer" is not a boring tool, but a tool for making a bored hole the right size and taper; "momentum" cannot be measured in units of distance; and a rubble wall *may* be built in courses.

Now, the greater part of the above criticism has been so directed as to suggest amplification of the glossary—first, by the inclusion of all terms of real usefulness with respect to road work, and derived from subjects bearing upon the engineering and administration of roads, and, secondly, by the extension of many of the definitions so that they may clearly convey the natures of the substances described in terms acceptable to the geologist and chemist. In the meantime, it is not too much to say the glossary, in its book form, embodying many suggestions and amendments, should be in the possession of everyone who has anything to do with road engineering.

Road Maintenance in Newcastle-on-Tyne.—The city engineer of Newcastle-on-Tyne, Mr. W. J. Steele, states in his annual report that the approximate total length of highway now maintained by the corporation is 253 miles. The cost of maintenance per mile, exclusive of debt charges, varies with the amount of traffic, but over the whole length, and after reducing the total mileage to a figure which makes the back streets equal in width to the front streets, it is about £131, whereas the average cost in fifteen of the large towns is £179.

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

THE WAR.

BRITISH MANUFACTURERS' OPPORTUNITY.

[redacted]

markets in certain lines of trade in which German [redacted]

"The present safety of the trade routes, coupled with [redacted] His Majesty's Government to facilitate the continuance [redacted] lead to the permanent advantage of British trade.

With a view to assisting British manufacturers and traders in this matter, memoranda have been prepared giving information with regard to possible developments in certain important trades. Any British manufacturer or merchant who desires to be [redacted] openings affecting his particular business should put himself in communication with the Director of the Commercial Intelligence Branch of this department, Basinghall-street, E.C., who will be prepared to give any further particulars possible respecting names of buyers, rates of import duty, &c., or to make special [redacted] through H.M. Trade Commissioners and the Trade Correspondents of the Commercial Intelligence Branch in the British self-governing dominions, India, [redacted] British Consular officers in neutral foreign countries."

LOCAL AUTHORITIES AND THE WAR.

St Pancras Borough Council will pay [redacted] to all men on active service.

A member of the service of the Belvedere Urban District Council, who has gone to the front, is to receive 13s. 6d. per week, and his job is to be left open.

Coventry Town Council will keep open posts of employees who go on active service and pay 10s. a week to the direct dependent and 1s. weekly for each child.

Nottingham Corporation have decided that the widowed mothers of corporation employees on service should be granted similar payment to that given to the wives.

Camberwell Borough Council have resolved that the position of every employee who serves with the colours shall be kept open, and full salary or wages paid while on service.

Norfolk County Council have decided that the places of the men on active service shall be filled temporarily. The question of allowances has been referred to the Finance Committee.

Holmfirth Urban District Council have agreed to pay the dependents of a national reservist who has been called on service 10s. a week in addition to the Government allowance of 12s. 10d.

The precedent of the Boer War is to be acted upon with respect to the treatment of the families of men of the Glasgow Corporation called to join the colours until a committee has reported on the subject.

The city engineer of Wakefield, Mr. J. P. Wakeford, has received instructions to submit a scheme for work in connection with the roads of the city, towards which the Road Board have promised substantial grants.

Forty employees of the Hackney Borough Council have gone on active service—ten from the town hall staff, and thirty from the outside workers. The borough council intend to look after the dependents of the men.

The City of London Corporation have decided to follow the plan of the Government in the case of employees called up for service, and pay full salaries to married or unmarried men alike. Pay or allowance will, however, be deducted.

All committees of the Gloucestershire County Council [redacted] meeting of the council, to pay half wages to such of [redacted]

Hammersmith Borough Council have resolved that [redacted] their full salaries or wages; also that the places of those called to the colours shall be temporarily filled.

From a report of the borough surveyor, Mr. J. [redacted] highways staff of the Cambridge Corporation have been called up for service. The question of allowance to [redacted] Committee.

[redacted] caused by the war, the urban district council on Tuesday decided to proceed at once with the erection of 100 [redacted] Wyldecroft estate, North Finchley, at a cost of £26,450. The houses are to be let at rentals of 7s. 6d. and 8s. 6d.

An emergency Local Government Board inquiry has been held at High Wycombe to consider an application for £11,200 for the erection of fifty-four workmen's dwellings on land purchased from the Marquess of Lincolnshire for £880. The scheme will facilitate local employment during the war.

Watford Urban District Council have instructed the surveyor, Mr. D. Waterhouse, to proceed with all possible speed with the road scheme initiated by the county council, and it has also been agreed to seek power to borrow £5,000 on account of the water-pumping contract, and £3,054 for sewer reconstruction.

Brentford Town Council have agreed to pay their employees called up for service the difference between the Government allowances and their ordinary pay.

Having regard to probable unemployment caused by the war, it has been resolved to ask the county council to expedite their decision in regard to the proposed new science and art schools.

St. Austell Rural District Council have adopted a report of the committee appointed to consider the question of relieving unemployment during the war, recommending road widenings, the construction of short pieces of new road, and the cutting off of corners. The committee have been authorised to obtain the necessary details and estimates, and take steps to obtain grants from the Road Board.

So far there is no widespread unemployment in Sheffield, but plans for relief works are ready for putting into operation. Street widening schemes and building schemes for the improvement of Sheffield will be put in hand, and the work will be carried through under the direct supervision of the corporation officials. For many of these schemes the city had the consent of the Local Government Board before the war broke out.

It was stated at a meeting recently of the Hornsey Town Council, that the borough surveyor, Mr. E. J. Lovegrove, had completed a list of council works that could be put in hand. These included the making up of roads, the rekerbing of Archway-road, and the construction of a sewer at Coppetts-road. Several of the schemes had been approved by the council, and the latter work, which was estimated to cost £1,800, awaited the sanction of the Local Government Board. —Eleven employees of the council have been called to the colours, and it has been decided to make up their full wages.

The council of the Society of Architects, at a meeting on August 20th, unanimously decided to support, by every means in its power, the movement initiated by the Royal Institute of British Architects, and to place at the disposal of the Architects' War Committee the society's premises and staff at Bedford-square for the use of any of the sub-committees. They further voted a first grant of 100 guineas as a contribution to a fund to be formed for providing paid work for architects whose means of livelihood is stopped by the war, and undertook to appeal to members of the society and their friends for generous contributions towards this fund.

Housing (Ireland) Bill.—In the House of Commons on Tuesday a Bill to extend to Ireland the provisions of the Housing Act, passed this Session, was read a second time.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 21 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

THE MONTHLY PREMIUM.

Mr. N. S. Jeffrey, of Darlington, has chosen the following books in respect of the month's premium for July which was awarded to him:

"Practical Sewage and Sewage Disposal," by H. C. H. Shenton (Local Government Journal Office).

"Manchester Engineering Models: Answers to Questions" (St. Bride's Press, Limited), and

"A.B.C. Three-Figure Logarithms," by C. J. Woodward Sparke.

These have been despatched to him.

QUESTIONS.

This week answers are invited to the following questions:—

417. Sewer Construction.—A sewer is being constructed partly in tunnel. Describe a method of giving the levels in the heading, referring specially to the continuation of the line of levels from the surface. (Xing.)

418. Iron Curved Roof. Show details of an iron curved roof of 40-ft. span, resting on girders and stanchions on one side, and on a 14-in. brick wall on the other. The roof is to be covered with corrugated iron. Show enlarged details at the foot of the principal rafter at each end. (K. G. F., *Buckfastleigh.*)

419. Practical Mathematics.—Explain a graphical method for solving simple simultaneous equations, and give a worked example.

421. Reactions of Beams.—Show how to find graphically or otherwise the pressures on the two supports of a horizontal beam which is loaded at any given points.

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

416. Concrete Floor.—Give two sections of a reinforced concrete floor for a span of 30 ft., showing the sizes and weights of the girders, and giving the necessary calculations. (K. G. F., *Buckfastleigh.*)

The span (effective) is given as 30 ft., and we will assume that the beams are 10 ft. centre to centre, and also that the floor is for a warehouse to carry a load of 200 lb. per foot super. The floor slab may be considered as a continuous beam, as it passes over more than three spans, the bending moments being taken as $\frac{WL}{24}$ at the centre of the beam and $\frac{WL}{24}$ over the supports. The main beams will be considered as supported only, and BM = $\frac{WL}{8}$.

Using the notation adopted by the R.I.B.A. Committee's second report—viz.:—

W = total working load on beam in lb.
L = effective length of beam in inches.
n = depth of axis from the extreme compressed edge.
d = depth of beam in inches (effective).
c = compressive stress to be allowed in concrete = 600 lb. per sq. in.
b = breadth of beam in inches, or breadth of flange in T beams.
a = arm of resisting moment or lever arm = $\left(d - \frac{n}{3}\right)$ for slabs.
At = area of tensile reinforcement in inches.
t = tensile stress in steel in lb. per sq. in. = 16,000.
ds = total depth of beam.
m = ratio of elasticities of steel and concrete = 15.
r = ratio of tensile reinforcement = $\frac{At}{bd}$
br = breadth of rib in T beams (in inches).
s = intensity of shearing stress in concrete = 60 lb.
s_1 = " " " steel = 12,000 lb.

The depth of the neutral axis may be obtained by the formula

$$n = \frac{mcd}{t + mc} = \frac{15 \times 600 \times d}{16{,}000 + 15 \times 600} = \frac{9}{25}d$$

$$\therefore a \text{ (lever arm)} = d - \frac{n}{3} = d - \frac{3}{25}d = \frac{22}{25}d$$

Compressive resistance $= \frac{c}{2}bn$

and moment of compressive resistance

$$= \frac{c}{2}bn \times a = \frac{600}{2} \times \frac{9}{25}d \times \frac{22}{25}d = 95{\cdot}4\, b\, d^2$$

Compressive resistance = tensile resistance

$$\frac{c\,b\,n}{2} = At \times t$$

$$At = \frac{c\,b\,n}{2t} = \frac{600 \times b \times \frac{9}{25}d}{2 \times 16{,}000} = 0{\cdot}0675\, b\, d.$$

Taking the weight of reinforced concrete as 150 lb. per foot cube, and the depth of the slab being assumed at 6 in., its weight = 75 lb. per foot super.

The total load on the slab will therefore be 275 lb. per foot super.

$$\frac{BM}{WL} = \frac{MR}{95{\cdot}4\, b\, d^2}$$

Considering a 12-in. length, then,

$$\frac{275 \times 10 \times 12}{12} = 95{\cdot}4 \times 12 \times d^2.$$

$$\therefore d^2 = \frac{275 \times 10 \times 10 \times 12}{12 \times 95{\cdot}4 \times 12} = 23{\cdot}16.$$

$\therefore d = 5''$ nearly.

or a total depth ds of 6 in. to allow for wear of surface, and for covering reinforcement.

$$At = 0{\cdot}0675\, b\, d.$$
$$= 0{\cdot}0675 \times 12 \times 5 = 4{\cdot}050 \text{ sq. in. per ft. run.}$$

A $\frac{5}{16}$-in. sq. rod has an area of 0·0977 sq. in. Four $\frac{5}{16}$-in. rods at 3-in. centres per foot run gives an area of 0·3908 sq. in. This area will be found to give a stress upon the steel of just under 16,000 lb. per square inch, being caused by the depth of the slab being slightly more than the calculated depth. The rods would change from the bottom to the top of the slab at the points of contra flexure—that is 0·212 of the length of the beam from the supports = 8·66 ft.

Fig. 1 shows a cross-section of the slab as calculated above. The main beam may be considered as a T beam, the breadth of the table being taken as recommended in the R.I.B.A. Committee's second report—*i.e.*, the flange should not exceed—

(1) One-third of the length of the beam.

(2) Three-quarters of the distance from the centre to centre of the ribs.

(3) Fifteen times the depth of the slab.

In this case 1 = 10 ft., 2 = 7 ft. 6 in., 3 = 7 ft. 6 in., the breadth of the slab is therefore taken as 7 ft. 6 in. Assuming that the neutral axis falls at the bottom of the slab, $ds = n = 6''$.

$$n = \frac{9}{25}d$$

$$\therefore d = \frac{25}{9} \times 6 = 16\frac{2}{3}.$$

$$\frac{BM}{WL} = \frac{MR}{95{\cdot}4\, b\, d^2}$$

$$\therefore \frac{WL}{8} = 95{\cdot}4\, b\, d^2.$$

Taking the weight of the rib as 200 lb. per foot-run, we get—

$$\frac{WL}{8} = \frac{30 \times 275 \times 10 \times 30 \times 12 + 200 \times 30 \times 30 \times 12}{8} = 39575{\cdot}0$$

and $95{\cdot}4\, br \times 90 \times 16{\cdot}5 \times 16{\cdot}5$

$= 2{,}284{,}000$

The difference between these = 1,673,500 inch lb. must be taken up by the steel in compression.

The stress allowable on steel in compression = mc = 9,000 lb. per square inch.

$$\therefore \text{steel in compression required} = \frac{1673500}{9000 \times 16{\cdot}5}$$

$$= \frac{1673500}{9000 \times 16{\cdot}5} = 12{\cdot}80 \text{ sq. in.}$$

Therefore 1¼ rods give an area of 12·922 sq. in.

$A \times s \times a = BM$

$\therefore A = \frac{BM}{s \times a} = \frac{3957500}{\frac{22}{25} \times 16.5 \times 16000} = 17.01$ sq. in.

Four 1¼ in. rods give an area of 17·671 sq. in.

The web (or rib) should not be less than one-fifth of the width of the flange $= \frac{90}{5} = 18$

This is not an economical design as the percentage of steel is too large. If, however, the depth of the rib is increased, the neutral axis falls below the bottom of the slab, and involves rather complicated formulæ. These formulæ and their derivation are given fully in the R.I.B.A. Committee's second report, Appendix I.

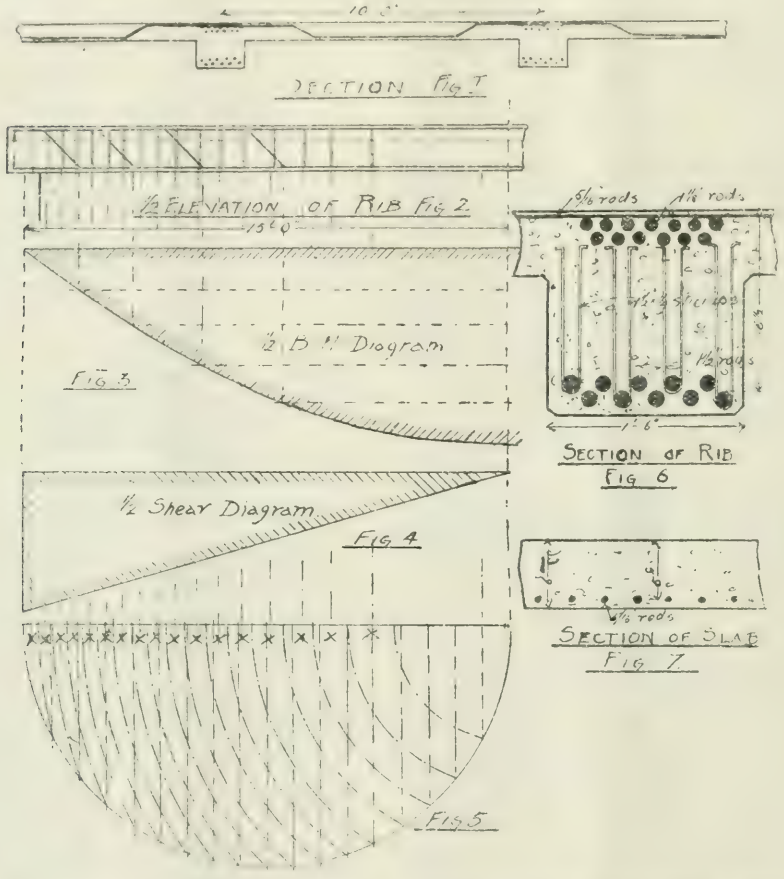
$A = \frac{22}{25} \times 16.5 \times 12.000$

$\therefore as = \frac{663750}{\frac{22}{25} \times 16.5 \times 12.000} = 46.07$ sq. in.

Eight of the bent rods provided to take the bent-up stresses can be turned up at the ends and made to take part of the shear stress.

Eight 1¼ in. rods have an area of $8 \times 1.767 = 14.136$ sq. in., and 4 turned up at an angle of 45 deg. have an effective area of $4 \times 2 \cdot 14.136 = 19.99$ sq. in.

This leaves an area of 26·08 sq. in. to be provided in the form of stirrups. Using ⅞-in. × ⅛-in. flat iron (area of iron we get an effective area



Shear Stresses.—The resistance of the concrete in the rib to shear is so small that it may be neglected. The shear members may be calculated by the formula—

$$as \cdot Ss = \frac{Sp}{a}$$

$$\therefore as = \frac{Sp}{Ssa}$$

Where as = area of steel resisting the shear
Ss = safe stress upon steel in shear = 12,000 lb.
S = shear stress at any vertical section
p = length of section
a = lever arm of resistance moment
Consider ½ of the beam
The shear diagram is a triangle and the maximum shear = ½ W

$$\therefore \text{total shear on beam } Sp = \frac{\frac{1}{2}W}{2} \times \frac{l}{2}$$

$$= \frac{(275 \times 30 \times 10) + (260 \times 30)}{4} \times \frac{30 \cdot 12}{2}$$

$$= 3,982\,500$$

of 1½ in. to each set, the number of sets required is therefore $\frac{26{\cdot}08}{1\frac{1}{2}} = 17{\cdot}3$, say eighteen sets. The points at which the tension rods may be turned up is most easily found by plotting the bending moment diagram to scale and dividing it into five equal depths (the number of points at which rods are to be turned up), and projecting these points, as shown in Fig. 3. The method of spacing the shear members for a uniformly distributed load is shown in Fig. 5. Describe a semi-circle on half the beam length, and divide the diameter into the same number of spaces as there are sets of shear members, and projecting at right angles to the diameter to cut the circumference. With the centre of the beam as centre turn these points back to the diameter. One set of stirrups should then be placed at the centre of each of these divisions. Fig. 6 shows a large scale and section of the rib, and Fig. 7 a section of the slab at the centre of its span. (J. A. R., *Faversham.*)

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Harwich T.C. (August 27th. Mr. H. A. Chapman). £2,140 for the purpose of a scheme under Part III. of the Housing of the Working Classes Act, 1890, for the purchase of land and the erection of workmen's dwellings.—The town clerk, Mr. A. J. H. Ward, stated that the plans for the scheme had been got out by the borough surveyor, Mr. F. Harold French. It was proposed to erect houses to be let at 7s. per week, including rates and taxes. The borough surveyor stated that the accommodation provided on the ground floor consisted of a living-room, scullery, and in the yard, coal-house, &c. Upstairs there were three bedrooms, the largest being 13 ft. by 7ft. He considered the houses the best type to meet the needs of the neighbourhood, and he did not anticipate any trouble in finding suitable tenants. He knew of no vacant cottages in Harwich that were fit for habitation.

Hull T.C. (August 20th. Dr. A. S. MacNalty and Mr. R. G. Hetherington). £14,458 for the erection of a sanatorium and hospital, on the Cottingham Castle estate, for the treatment of cases of tuberculosis.—Also an application for a capital grant of £10,800 from the Government towards the cost.—It was stated that at present the corporation had accommodation for twenty-five patients, and it was intended to provide 120 beds in the new sanatorium. Alderman Askey, chairman of the Health Committee of the corporation and of the Insurance Committee, explained that the contractors for the administration block had withdrawn their tender, but the Health Committee, if they failed to get another tender at the same price, intended to do the work themselves, desiring to carry out their obligations and to provide employment for Hull workers at this time. Mr. Hirst, city architect, said the corporation could carry out the work without any extra expense. In getting out the quantities he had taken into account the rise in the wages rates.

Mytholmroyd U.D.C. (August 6th. Mr. F. H. Tulloch).—£1,000 for works of water supply.—It was explained that it was proposed to keep in use the present main to the Hebden Bridge boundary and lay a new main from Upper Foot, which was the boundary of the Luddenden Foot Council, to White Lee-terrace. For a considerable number of years the council had taken water in bulk from the Halifax Corporation through the Hebden Bridge mains, but the supply was not satisfactory. At the time the existing arrangements were made that was the only available source of supply. After careful consideration it was decided to take water in bulk from Halifax at Upper Foot. An agreement had been entered into and water was in future to be supplied through meter in bulk at Upper Foot. To carry out the new arrangement it was necessary to lay a 6-in. main. The council had only until September 30th, and it had thus been necessary to start with the work.

Oughterard (Galway) R.D.C. (August 12th. Mr. A. D. Price).—£3,056 for sinking and enclosing forty-five wells in the Lattermore district.—The engineer, Mr. Edward O'Malley, gave evidence of the proposed cost and location of the different wells throughout the entire district, and other witnesses, including the medical officer of health, Dr. Edmond Hearne, stated that there was great need for the wells, and that the existing water supply was insufficient and of poor quality.

Rotherham R.D.C. (August 22nd. Mr. M. K. North).—£2,442 for street improvements at Aston Swallownest, Bramley, Brampton-en-le-Morthern, Morton and Treeton.—The works, it was stated, were necessitated by the development of the district owing to the sinking of large collieries, and the consequent increase of traffic on these and district roads.

Swanage U.D.C. (August 13th. Mr. W. O. E. Meade-King). £8,250 for the purpose of purchasing land overlooking the promenade, to be used as a recreation ground.—It was stated that an agreement had been reached with Mr. J. E. Mowlem, owner of the greater portion of the land it is proposed to purchase. The surveyor, Mr. W. H. Pearce, stated that the council intended to keep the two houses on the estate for the present.

APPLICATIONS FOR LOANS.

Abingdon T.C. £1,000 for the extension of water mains and the purchase of water meters.

Billinge U.D.C.—£600 for water main extensions.

Cambridge T.C.—£3,000 for the erection of cottages.

Eastbourne T.C.—£60,545 for a housing scheme.

Kesteven C.C.—£2,202 for new buildings and alterations to existing buildings.

Nuneaton T.C.—£350 for a public convenience.

Rainford U.D.C.—£2,500 for workmen's dwellings.

Rawtenstall T.C.—£3,500 for the extension of the boiler house at the electricity works, and £600 for a bowling green.

Redruth R.D.C.—£4,250 for the St. Day water supply scheme.

Settle R.D.C.—£900 for works of sewerage.

Weymouth T.C.—£165 for walling and road work.

LOANS SANCTIONED.

Brampton R.D.C. £140 for works of water supply.

Kinsale R.D.C. £1,444 for an improvement scheme.

Northwich R.D.C.—£1,352 for the erection of working class dwellings.

Shipley U.D.C.—£1,295 for the extension of the sewage works.

Skelmersdale U.D.C.—£12,200 for a sewage disposal scheme.

Southend T.C.—£365 for sewerage works.

Spalding R.D.C. £1,375 for the erection of cottages.

Whickham U.D.C. £1,364 for the Dunston sewerage works.

Woking U.D.C.—£300 for the purchase of land for road improvement.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making information given under this head as complete and accurate as possible.*

BUILDINGS.

Burnley T.C.—It is proposed by the Education Committee that [illegible] at an estimated cost of £26,000.

Coventry T.C.—The council have agreed to proceed at once with the construction of a new storage reservoir at Coundon. As far as possible the work will be carried out by the direct employment of labour.

Denbighshire C.C.—It has been agreed to ask the Government to reconstruct Waterloo bridge, an important link in the main route between London and Holyhead.

Guisborough R.D.C.—An intimation has been received from the county council of their intention to build a stronger and wider bridge at Dunsdale, at an estimated cost of £1,200.

Huddersfield T.C.—A scheme for the erection of public [illegible] is under consideration.

Nelson T.C.—A scheme for the provision of public [illegible] has been approved. The estimated cost is £11,000.

Taunton T.C.—The tender of the British Steel Piling Company, at £38, has been accepted for works of piling on the gashouse field at French Weir. The council have approved the plans and specification of the borough surveyor, Mr. D. Edwards, for a house for the manager of the sewage disposal works, at an estimated cost of £450.

Tyrone C.C.—The council [illegible] for the purchase of Dungannon House for the purpose of a county council office, that the estimated cost is £3,500. It is proposed that the present buildings should be used for the nursing staff and for administrative purposes, and that a pavilion containing two wards to accommodate eight patients should be erected.

HOUSING AND TOWN PLANNING.

Bulkington U.D.C.—As the result of a letter from the Local Government Board the council have decided to expedite the inspection of the local housing conditions.

Coventry T.C.—A telegram has been received from the Local Government Board authorising the council to proceed with the erection of 100 houses for the tenants to be displaced by the Leicester-street widening improvement, and stating that the usual local [illegible] would be dispensed with. It is hoped to get [illegible] in hand at once.

Dalkey (Co. Dublin) U.D.C.—A site, consisting of 5 acres on the Carysfort road, has been secured for the purposes of a housing scheme. The cost was £1,270, and it is subject to a ground rent of £5 a year. It is proposed to erect thirty-three houses at a rental of 7s. 6d. per week, and to utilise the remainder of the land as a park and playground. Each house will contain five large rooms, with hot and cold bath. The estimated cost of the scheme is £10,000.

Eastbourne T.C.—It has been agreed to carry out a housing scheme on land belonging to the Duke of Devonshire, at an estimated cost of £60,000. The borough surveyor, Mr. A. E. Prescott, reports that the agent of the Duke has accepted the two following schemes: Archery site—For the provision of seventy-seven semi-detached houses and seventy-seven terraced houses at an estimated rental of 7s. 5½d. each per week. Victoria-drive—For the provision of eighty-two semi-detached houses at an estimated rental of 7s. 6¼d. each per week.

Hemsworth R.D.C.—The council have adopted an [illegible] for the erection of between 100 and [illegible] in Hemsworth and adjacent districts.

Holmfirth U.D.C.—The architect, Mr. P. N. Brown, has received instructions to submit a plan of two blocks of five houses each, part of a scheme of thirty-three houses which it is proposed to build.

Midhurst R.D.C.—The Local Government Board have expressed general approval of a scheme for [illegible] dwellings, which is estimated to cost £780.

Sheffield T.C.—The Estates Committee has received authority to prepare a scheme for the complete development of the Wincobank estate for artisans' dwellings, and present a report as soon as possible.

PARKS AND OPEN SPACES.

Coventry T.C.—The city engineer, Mr. J. E. Swaddley, has received instructions to prepare a scheme for the enclosure and improvement of Gosford Green, and to make inquiries as to the possibility of obtaining land adjoining the green for the purpose of extending the open space.

Hull T.C.—The city engineer, Mr. A. E. White, has received instructions to prepare plans for two bowling [illegible] in the public park.

ROADS AND MATERIALS.

Abersychan U.D.C.—The surveyor, Mr. E. Whitwell, has received instructions to proceed with the proposed work at Manor-road. The council have also resolved to write to the Local Government Board for permission to proceed with other projected schemes of improvement.

Barry (Glam) U.D.C.—It has been agreed to write to the Local Government Board for a grant towards the widening of Port road from Stumpy Hall to Weycock-road. It has also been decided to widen Palmerstown-road and to improve the roadways in the parks, level the Buttrills recreation ground, and carry out various works of private street improvements.

Bellingham R.D.C.—The diversion of East Woodburn-road is now in progress, and the surveyor, Mr. R. E. Riddle, has made a satisfactory arrangement for an exchange of land for the widening of the thoroughfare along the Fox and Hounds land.—The surveyor has been congratulated on the completion of the road at the Smale and up the Tyne, a councillor going so far as to say that if they kept going on the council would soon have the best roads in England.

Bethnal Green B.C.—The council have submitted to the Road Board a scheme of street works which could be immediately put in hand to provide employment in the borough.

East Stow R.D.C.—The surveyor, Mr. G. Harrison, has received instructions to prepare a scheme for making up Victoria road, Stowupland.

East Suffolk C.C.—The Roads and Bridges Committee reported on Tuesday last that, as most of the granite for the main roads was imported from abroad, it was very difficult to get deliveries of stone. They therefore asked power to purchase stone from English quarries. The chief surveyor had interviewed the Road Board on the matter, and the board's surveyor strongly advised that the work on the roads should not be curtailed or delayed. The Road Board would be prepared to contribute the interest on the £15,000, which was the estimated amount required to be expended out of revenue during 1915-1916. The proposal that the council proceed in this matter was agreed to.

Flintshire C.C.—A scheme has been approved for the construction of a new road, at an estimated cost of £26,000.

Gainsborough U.D.C.—The surveyor, Mr. S. W. Parker, has received instructions to set to work wholly unemployed men three or four days a week. The relief works will include street making and an esplanade on the Trent bank.

Glamorgan C.C.—The Roads and Bridges Committee have approved the scheme of the Glyncorrwg and Margam District Councils for the construction of a road connecting the upper reaches of the Avon Valley with Port Talbot (including Tondu bridge), about 9 miles in length, 24 ft. wide, and estimated to cost

£24,000, of which £14,000 will be allotted to the Margam Council and the remainder to Glyncorrwg. The committee are asking the Road Board to make as large a grant as possible, and have promised that the county authority will take over the road when completed.

Gloucestershire C.C. The council have authorised the Highways, Works, and General Purposes Committee to expend, in addition to the expenditure for the year 1914-15 previously estimated, such sum as they may think fit on road improvements and other public works, to prevent as far as practicable unemployment.

Isle of Wight R.D.C. Negotiations have been opened up with the Road Board with a view to the adoption of a scheme for the improvement of the main road of the island at a cost of £[illegible].

Linthwaite U.D.C. The surveyor, Mr. A. Mallinson, has been instructed to prepare plans for the repair of Manchester-road.

Manchester T.C.—The city council have decided to construct a new trunk road to link up Manchester with Cheadle and Gatley on Cheshire. The Manchester end will proceed from Stockport-road and Birch Fields, Rusholme on the eastern side of the London and North Western Railway, pass through Burnage and Cheadle, and join the main road to Wilmslow. The total length will be nearly 4½ miles, and the estimated cost is £271,647. The road will be 80ft. wide. Sir George Gibb, chairman of the Road Board, has offered £60,000 towards the cost of the scheme. Aldermen Wilcox, Alderman Turnbull, and the city surveyor, Mr. T. de Courcy Meade, met Sir George Gibb on Tuesday, and got his promise of help.

Neath R.D.C.—The surveyor, Mr. D. M. Jenkins, has submitted a list of public works which the council could put in operation, and on Monday last he was instructed to prepare plans and estimates for the proposed Dulais Valley road for submission to the county council, who are prepared to apply to the Road Board for a grant for its construction and maintenance.

Nottingham T.C.—The corporation are extending the tramway system, and are also pledged to the repaving of certain streets. Such work as this might (the *Nottingham Guardian* states) be expedited, and if there is any other work of which the same may be said, so much the better. There are several reasons why it is desirable to keep those people who cannot fight well employed at the present juncture.

Ogmore and Garw U.D.C. It has been agreed to write to the Road Board and the county council that it was desirable that a new road should be made from Brynmenyn to Bridgend, and that if the board would make a substantial grant the council would commence the work immediately. It was also decided to widen the road between Bettws Railway Station and Llangenior if unemployment made the work necessary.

Oxendon (Northants) R.D.C.—The surveyor, Mr. W. J. Smith, has received instructions to prepare road improvement schemes, which are estimated to cost £540.

Redruth U.D.C.—The surveyor, Mr. H. Monson, has been instructed to prepare an estimate for the county council of a scheme of improvement at St. Day road for which the necessary land has been presented.

St. Columb R.D.C.—The surveyor, Mr. T. T. Strongman, has submitted an estimate of the cost of carrying out stipulated works on the highway from Indian Queens to Quintrell, and it has been decided to forward a copy of the estimate to the county surveyor, as desired, a special committee being appointed to deal with any matter which might arise in connection with the road.

St. Pancras B.C.—It was stated at the council meeting recently that the borough surveyor, Mr. W. Nisbet Blair, had seen the chief engineer to the Road Board, and that the latter official had asked for particulars of works upon which displaced labour could most usefully be employed. When the full amount authorised for highway maintenance for the year had been expended the Road Board would pay over the extra sum requisite.

Swansea R.D.C.—Plans have been completed for a new road between Dunvant and Gowerton.

Tilbury U.D.C.—The council have submitted to the Essex County Council and the Road Board the following schemes as suitable for adoption immediately—viz., wood paving Dock-road, at an estimated cost of £4,749; widening Sandy-lane; and widening and improving the main road from Brentwood to Gravesend, at an estimated cost of £16,563.

Tottenham U.D.C.—It is proposed to repave the carriageway at Green lanes, at an estimated cost of £15,457.

SEWERAGE AND SEWAGE DISPOSAL.

Burryport U.D.C.—A scheme of drainage, including the erection of a pumping station, has been approved. The cost is estimated at £12,000.

Dewsbury T.C.—Owing to the tenders for the construction of the sewage disposal works being considered too high, the engineer, Mr. J. Diggle, has suggested that the corporation should do the work with direct labour, and the General Purposes Committee recommend the adoption of this course. The total estimated cost of the scheme is £[illegible].

Doncaster R.D.C.—The council have approved a scheme of sewerage which is estimated to cost £5,000.

Guiseley U.D.C.—The Local Government Board have sanctioned the borrowing of £3,700 for extensions of the council's sewage works and for surface-water drainage. The council's engineer is Mr. J. N. Nicholson, ASSOC.M.INST.C.E., Bradford.

Long Eaton U.D.C.—The improvement of the main sewers and the construction of a new filter-bed are to be carried out at an estimated cost of £1,300.

Ossett T.C.—The council are advised by the sanitary inspector, Mr. C. Firth, to undertake the work of scavenging as a municipal responsibility.

Tilbury U.D.C.—An extensive scheme of surface-water drainage is under consideration, and a site for sewage disposal works has been purchased at an estimated cost of £800.

Woodhall Spa U.D.C.—The plan has been approved for the construction of a new road from Horncastle-road to Tor o' Moor-road.

WATER, GAS, AND ELECTRICITY.

Sleaford R.D.C.—The Local Government Board have declined to sanction a loan for the Anwick water supply scheme unless a pumping plant is provided; and with respect to the Enderby combined scheme, they consider that the design of the proposed water tower is not altogether satisfactory.

Rathdown No. 1 R.D.C.—An agreement has been reached with the corporation of Wicklow for a supply of water, and the engineer has received instructions to prepare estimates for the construction of mains through the district.

St. Pancras B.C.—The Electricity Committee have approved a scheme for the extension of the electric light station in King's-road.

MISCELLANEOUS.

Lanarkshire C.C.—The Middle Ward District have agreed to make arrangements for undertaking the execution of the following works at such times and in such manner as might be best calculated to meet the exceptional circumstances and conditions which might arise: (1) Camps water scheme, (2) new workmen's houses, (3) new road at Glenboig, (4) Hairmyres scheme, including forestry, (5) filling up low-lying ground at Motherwell Hospital, (6) any other works which had been provisionally agreed upon by the District Committee and the execution of which could be accelerated.

Sheffield T.C.—A special committee has been appointed to consider proposals for the re-arrangement of the city engineer's department.

Government and the New Housing Act.—The Local Government Board is urging urban and rural local authorities to take action under the new Housing Act. In a circular the board points out that, under the Housing Act, 1914, the board is authorised, with the approval of the Treasury, to make any arrangements with local authorities or authorised societies for the provision, maintenance, improvement and management of dwellings and gardens and other works or buildings for, or for the convenience of, persons belonging to the working classes, and to issue sums not exceeding £4,000,000 for the purpose of meeting capital expenditure. The Treasury will be prepared to consider advances of money to local authorities on approved schemes of building, and any advance made will be repayable in the usual periods—sixty years in respect of substantial buildings, and eighty years in respect of land purchase.

PERSONAL.

Mr. F. J. Walker, [illegible] has been appointed [illegible].

Mr. J. E. Hall has been appointed [illegible] to the Dorking Rural District Council.

Mr. J. R. Hutton has been appointed surveyor and sanitary inspector to the Great Berkhampstead Urban District Council.

Mr. T. Groves has been promoted to the office of [illegible], with works department, Negri Sembilan, Federated Malay States.

Mr. C. F. Gettings, county surveyor of Worcestershire, has appointed a [illegible] staff to render [illegible] to [illegible] The staff consists of [illegible] workmen.

Mr. N. T. Gray, State engineer, Pahang, Federated Malay States, has been transferred to Perak, and Mr. [illegible] promoted to the position of [illegible] engineer of Pahang.

Mr. W. Redfern Kelly, M.INST.C.E., engineer-in-chief to the Bootle Corporation, has resigned on completion of fifty years' service, and has consented to act as consulting engineer to the trust for one year.

Mr. Alfred John Jukes-Browne, F.R.S., F.G.S., the distinguished geologist, passed away recently at Torquay. He was the author of several standard handbooks on geology, and a work on "The Cretaceous Rocks of Britain."

Mr. R. Keeley, borough inspector to the Wolverhampton Corporation, has been appointed to a similar post under the Lancashire County Council, at a salary of £225 per annum. He received a farewell presentation from his colleagues at Wolverhampton.

Mr. E. Young Harrison, surveyor and water engineer to the Wellingborough Urban District Council, was on Tuesday unanimously appointed, out of seventy-three applicants, to the position of borough surveyor and water engineer of Guildford, at a salary of £350, rising to £450 per annum.

MUNICIPAL APPLIANCES IN DEMAND.

Messrs. John Yates & Co., Limited, Aston Manor, Birmingham, write: "We are pleased to inform you that so far there has been little, if any, diminution of orders from public authorities for tools; in fact, the contrary seems to be the case, as most of the county and other councils whom we regularly supply are ordering, and many other public authorities who have experienced difficulty in obtaining supplies from indirect sources, as purchasing direct from us. There will doubtless be considerable relief work done in the near future to alleviate the distress we fear we must look forward to during the forthcoming winter, and the special work will, we trust, enable us to keep our works and staff (that is, those of them who have not been called to the colours) fully employed. One interesting feature of the volume of business from new clients is that for our 'Briton' tip wagons and 'Contractor' diaphragm pumps. The cessation of supplies from the Continent has made us particularly busy in the departments manufacturing these, in addition to those parts of our works which confine themselves more particularly to the more regular requirements of our clientèle. We have complete sets of catalogues showing our manufactures as required by various professions, and can send a suitable list to any *bonâ-fide* user on request. To our regular customers we are addressing occasional letters advising them of the latest position regarding various goods we manufacture, and have made special arrangements to cope with the various difficulties arising at the present time, which we trust will be appreciated by our clients in our mutual interests."

Sheffield Hospitals Extension.—The Local Government Board have decided, without holding an inquiry, to sanction a loan of £65,000 for the extension of the Sheffield City Hospitals for Infectious Diseases at Lodge Moor. A portion of the hospital accommodation has now been set aside to meet the requirements of the military authorities.

THE MUNICIPAL AND COUNTY CLUB.

It would seem that that excellent institution the Municipal and County Club, which since its formation has had its home at Whitehall-court, is about to close its doors. It is hoped, however, that this will not be allowed to happen, and we understand that there has been put forward a scheme by which the club will come under new management. Negotiations are in progress for the acquisition of premises in the neighbourhood of the Savoy, and Mr. Charles Mason, of this journal, who is actively interesting himself in the project for carrying on the club, will be glad to hear from those who may be desirous of continuing the club, which has been so long and intimately connected with municipal affairs.

FOR OTHER ADVERTISEMENTS

See End of Paper.

ABERYSTWYTH RURAL DISTRICT COUNCIL.

BORTH WATER SUPPLY AND SEA OUTFALL SEWER.

CONTRACT No. 3.

The Rural District Council of Aberystwyth is prepared to receive Tenders from Contractors for the construction of a covered reservoir and the laying of 6-in., 5-in., 4-in. and 3-in. Cast-iron Water Mains, together with the Valves, Hydrants and other Castings and the laying of 15-in. Cast-iron Sea Outfall.

Plans and Sections of the proposed works may be seen, and Specification, Quantities, Form of Tender, and other particulars obtained, from the Engineers on application to Messrs. Dodd & Dodd, MM.INST.C.E., County Chambers, Corporation-street, Birmingham, on and after Friday, 28th day of August, 1914, on payment of a deposit of Five Guineas, which will only be returned on receipt of a *bonâ-fide* Tender and the return of all documents.

Sealed Tenders, endorsed "Tender for Contract No. 3," are to be delivered at my Office at Aberystwyth at or before noon on Monday, the 14th day of September, 1914.

The lowest or any Tender will not necessarily be accepted.

(By order)

HUGH HUGHES,
Clerk.

8 Market-street,
Aberystwyth.
August 25, 1914. (1,881)

ABERYSTWYTH RURAL DISTRICT COUNCIL.

BORTH WATER SUPPLY AND SEA OUTFALL SEWER.

CLERK OF WORKS.

The Candidate must have had previous experience of similar works, be able to set out works, test materials, use the various surveying instruments, and measure up work done.

The person will be required to act under Messrs. Dodd & Dodd, MM.INST.C.E., the Engineers to the Council.

The salary will be at the rate of Three Guineas per week.

Applications, endorsed "Clerk of Works," stating age and qualifications, accompanied by copies of three recent testimonials, to be sent to the undersigned not later than 12 o'clock noon on the 14th day of September, 1914.

Applicants who canvass any members of the Council, either directly or indirectly, will be disqualified.

HUGH HUGHES,
Clerk.

8 Market-street,
Aberystwyth
August 25, 1914. (1,880)

WEST SUFFOLK COUNTY COUNCIL. Divisional Surveyor for Main Roads required. Salary £145 per annum, to include provision and upkeep of Motor Cycle. Applications to be sent in before 15th September. Particulars from the undersigned. W. Lionel Jenkins, County Surveyor, Shire Hall, Bury St. Edmunds. (1,882)

SEWAGE DISPOSAL AND THE PROTECTION OF WATER SUPPLIES.

[Report made to the International Joint Commission by a joint commission of U.S.A. and Canadian engineers upon the pollution of the waters of the great lakes and rivers which form the boundary between the two countries, with suggestions as to the necessary remedies.*]

(1) Speaking generally, water supplies taken from streams and lakes which receive the drainage of agricultural and grazing lands, rural communities, and unsewered towns are unsafe for use without purification, but are safe for use if purified.

(2) Water supplies taken from streams and lakes into which the sewage of cities and towns is directly discharged are safe for use after purification provided the load upon the purifying mechanism is not too great, and that a sufficient factor of safety is maintained; and, further, provided the plant is properly operated.
